the extent of their application, but in the unseasonableness of the operation. Winter pruning is sometimes practised for the very cogent reason that it is a time of comparative leisure. Similar excuses have not been unfrequently resorted to, on days may remind some of us of certain mischievous acts performed, for the equally commendable reason, that we could find no more rational employment for our time. It is thought by those who have given much attention to the subject, that the most appropriate time for such operations is when the sap flows freely, or from the latter end of April to the middle of May. This is undoubtedly true in relation to the apple and pear tree, but in the opinion of some experienced, and distinguished cultivators, the peach, nectarine, apricot, plum, and cherry trees, should not be pruned execpt in August or September. The latter should be subjected to this operation as sparingly as possible. Lopping off the leading shoots, or any other of the principal branches, should be avoided as much as practicable, and while they preserve their health and vigor, those parts should be suffered to remain entire, and only the smaller, superfluous branches removed.

The wounds caused by the removal of the greater or lesser branches should be immediately covered by a composition of adhesive and healing ingredients, which will prevent the air and moisture from penetrating, and as the juices are then in an active state, little or no injury may be apprehended. If this were practised more generally than it has been, we should not witness so much of premature decay that is seen so extensively in our orchards and gardens.

I am unwilling to dismiss this subject without urging upon you the necessity of avoiding as much as possible, the removal of large and vigorous branches from your trees at any season. To secure success in the cultivation of fruit trees, and to give them a tasteful and ornamental, as well as useful form, with a view to productiveness, and a simultaneous ripening of their fruits, pruning should be commenced the year after they are transplanted, and repeated every successive spring, by cutting out from the exterior all the small, and superfluous, and intersecting shoots, wherever they appear, leaving the interior of the tree in the form of a tunnel. By this method, the fruit, on all parts of the tree, will be equally accessible to the influence of the sun, and will consequently be more equally matured, and of similar qualities on all its sections. Trees, like children, should be taught correct habits while they are susceptible of good impressions, and as we are directed to train up the latter in the way they should go, that in maturer life they shall not depart from the precepts that are instilled into their minds in youth, so is it desirable in relation to the former, that we should cultivate the young plant with reference to the future tree, and prune and train it as we would of our fruit trees. The energies of the whole have it to grow.

But this is not all that is essential to give efficacy to our labors. There is an evil to which many kinds of trees and plants are subjected, that demands our particular attention, and even when The habits and peculiarities of trees and plants that has been patiently and zealously exercised, it has proved only partially successful. The numerous kinds of insects which not only produce incalhe confusion, and avert much of the disappoint | culable mischief to the health, and beauty, and sent, to which those are exposed who neglect it. productiveness of the tree, but deprive us of no The unskilful use of the saw and the pruning inconsiderable portion of its fruit, have hitherto

knife, is frequently detrimental to trees, not only in eluded the vigilance and the ingenuity of man, in his efforts to provide either a preventive or a remedy for the injury thus occasioned. The insidious mode of attack in which they are guided by an unerring instinct, would seem to require the exercise of almost super-human skill, to avert or repress their ravages.

> Cleanliness is indispensable to the health, and beauty, and usefulness of fruit trees. The mosscovered wall is venerated as an object of antiquity; but the moss-covered tree excites no such reverential emotions. Nor is our respect for the sentimental cultivator of caterpillars, elevated in the ratio of success he attains in the pursuit of his favorite art. It were well enough while it administers to his pleasures, and gratifies his taste, that he should enjoy the exclusive benefit of his labors, and far better if he would restrain those objects of his regard within the limits of his own domain. If the propagation of those ingenious architects is an interesting employment; if he is gratified by the exhibition of their industry, and is impressed with the belief that it would be an act of eruelty to demolish their dwellings, and devote the occupants to death; that they would thus

> > -' in corporal suffering Feel a pang as great as when a giant dies,'

he must be indulged in the exercise of those kindred feelings, and in the unenvied possession of his vitiated taste. But the criminal disregard of the duties he owes to his neighbors, in the indulgence of such propensities, whether they proceed from choice or indolence, deserves the most severe and unrestrained rebuke.

Exudations, or any other unusual appearance of unhealthiness or unthriftiness in trees often indicate the proximity of the enemy, although such effects are produced 'sometimes by unskilful pruning. An early and careful examination will lead to the detection of the assailant, and, if seasonably made, may preserve the tree. No effectual preventive against the injurious operations of the borer upon many of our fruit, and some of our forest trees has yet been devised.

The cankerworm and the eurculio are the most extensively fatal, as they are the most crafty of the insect race, and no certain means have yet been discovered to induce the belief that an effectual preventive will be found to stay their annual ravages. The time, and labor, and experiments that have been devoted to the attainment of this desirable object, or employed in the investigation of the subject, are deserving of more success than have resulted from those efforts. Much useful and satisfactory information as to their character and habits, has, however been elicited, but that most desirable end, the prevention of their devastating effects, has been but partially attained. 'It is a consummation devoutly to be wished,' that all who are interested would unite their efforts in the endeavor to arrest the further progress of his scourge agricultural world could not be concentrated in, and applied to a more important purpose connected with the cultivation of fruit. Should any individual be so fortunate as to make the discovery that shall prove an infallible antidote to the incursions of this withering and blighting infliction, he will have the proud and enviable satisfaction of contributing much to the prosperity of his country, and will richly deserve to be numbered among its benefactors.

FOR THE NEW ENGLAND FARMER.

SUGGESTIONS ON THE CILTURE OF SILK.

MR FESSENDEN-Should you consider the following suggestions worthy of public consideration, you may give them a place in the New England Farmer.

It must be peculiarly gratifying to every patriot, to witness the increased attention, to the various branches of Domestic industry.

Not only are greater and increased encouragement given to those branches already in exercise, but new, various and public sources of domestic industry are daily developing; among which the growing and manufacturing of silk, is not of the least importance. Since the power-loom and spinning jenny have deprived the female part of the community of an important branch of industry, it is desirable that some other should be substituted, congenial to the capabilities and habits of that fairer part of the community.

The growing and manufacture of SILK, is a branch of industry considered peculiarly adapted to the capacity and management of females.

The best means, then, to introduce this branch of industry and make it popular with the ladies, ought to be brought into exercise. Much has been said and written of late, in favor of the extensive culture and manufacture of silk; and although it has been demonstrated, that silk can be successfully cultivated in all parts of the United States, no one has attempted to point out the best method of introducing this important branch of domestic industry among the people. It is, in the first place, necessary that the best skill and methods of producing the raw material, should be imparted to every section of our country, in the best practicable manner; and in the next place that it should be made a desirable and popular employment for our females; and it never can be brought into favor with the fairer part of the community, till our ladies, who are best informed, will heartily engage in it, and by their example and encouragement, bring it into general favor.

How is this to be effected? Permit me, my dear sir, to suggest for the consideration of those who are better informed, and who take a deep interest in this subject, the propriety of attaching to each of the high or primary schools for young ladies, through the country, a garden or plat of ground for the growing of the mulberry. Also an establishment for producing and rearing the silk worm, and the manufacture of silk, where all the young ladies in those schools shall be taught as a recreation or healthful exercise, the economy of the silk worm-the best method of producing, feeding, and rearing the worm, so as to produce the raw material.

In this way our young ladies would soon learn to look on a worm, without fainting or disgustand being made familiar and acquainted with this branch of industry, would earry home with them, into all parts of our country, their skill and experience, which they would impart to their poorer neighbors. In this way, the cultivation and manufacture of silk would soon become a pleasing and popular, as well as a lucrative and ing the treatment of the worms and the want of the curer will next take off the sharp edge along healthful employment, for our females generally. The same culture and employment might also, other perplexities, we have done but very little at off the first rib next the shoulder, where he will be attached to the schools for lads.

duced, without risk, or the aid of much capital, per lb. throughout every section of our country; and nothing like a monopoly in the business could be will inform us through the medium of the New apprehended.

These suggestions are thrown out, in order to excite discussion and call the attention of the publie, more particularly, to so important a subject.

CASTOR OIL.

Mr Fessenden-If any of your correspondents will give the public a description through the New England Farmer, of the method of extracting the oil from the Castor Oil Bean, they will confer a favor on more than ONE SUBSCRIBER.

Middlesex, Dec. 31.

The following article taken from the American Encyclopedia, will serve as an answer to our correspondent's inquiry:

ma Christi,) is a native both of the East and West from a place 50 miles to the northward, they were Indies, and has a stem from 5 to 15 or 16 feet in probably a week later in ripening than they would height and lauge bluish-green leaves, divided into have been at New York. It is not quite as sweet seven lobes, serrated and pointed, the foot-stalks a fruit as the green gage, but has a more sprightly long, and inserted into the disk. The flowers are flavor, and is the best of all the late plums. The produced in a terminating spike, and the seed tree produces abundantly, and is of vigorous and vessels are covered with spines, and contain three thrifty growth. It is a native fruit of the state of flattish oblong seeds .- It is to the seeds of this New York and the circumstance of its coming in plant that we are indebted for the drug called after all the other fine plums are past, renders it a castor oil.

It is now often prepared by pressing the seeds in the same way as is practised with oil of almonds. plum which centains above 200 trees, all of which The oil thus obtained is called cold expressed. But are of the natural growth, having been reared from the mode chiefly adopted in the West Indies is first to strip the seeds of the busks or pods, and then to bruise them in mortars. Afterwards they are tied in linen bags, and boiled in water, until the oil they contain rises to the surface. This is carefully skimmed off and strained, to free it from any accidental impurities, and bottled for use. The oil which is obtained by boiling is considered more mild than that procured by pressure, but it sooner becomes rancid. The mildest and finest Jamaica castor oil is very limpid, nearly colorless, and has scarcely more smell or taste than good olive oil. Many people, however, have so great an aversion to castor oil, even in its purest state, that pork: when the end of the cask is fixed in, the they do not take it without great reluctance. The uses of castor oil in medicine are well known. It is at present prepared in great quantites in various parts of the United States and of an excellent of experience, which therefore deserves to be more

FROST GAGE, Pr. Cat.

The fruit is about the size and form of the green gage, of a dark purple color; it ripens about the 1st of October, and has been sold in the markets CASTOR OIL, .- The castor oil plant (vicinus pal- at New York as late as the 10th, but being brought highly valuable addition to the assortment of that fruit. I know of one orchard of this valuable suckers from the original trees and their produce is very great. WM PRINCE. Lin. Bot. Garden, N. Y.

Jan. 1, 1:31.

OF CURING PORK AND BACON.

The curing or pickling of pork is carried on to a considerable extent at many of our sea-ports. The carcase is cut into pieces, and packed in casks or kits, made for the purpose, containing from one to two hundred weight. Salt is dissolved in water till the mixture be strong enough to swim an egg; it is then boiled, and when cold, poured upon the article is ready for being sent to market. Henderson, a late writer, bas given particular directions for curing bacon, founded upon a long course generally known,

The curing of bacon is thus described by Henderson, after much experience. After the carcase has hung all night, lay it upon a strong table, or bench, upon its back; ent off the head close to the ears, and cut the hinder feet so far below the hough as will not disfigure the hams, and leave plenty of room to hang them by; then take a cleaving knife, and if necessary, a hand mallet, and divide the carcase up the middle of the back bone, laying it in two equal halves: then cut the distant when we shall be more awakened to the ham from the side by the second joint of the back importance of this subject in Middlesex. We hone, which will appear on dividing the carcase; have to be sure several nurseries, and some orchilthen dress the ham by paring a little off the flank ards of Mulberry trees in various parts of the coun- or skinny part, so as to shape it with a half round ty; but for the want of proper information respect- point, clearing off any top fat that may appear; filatures for the reeling of the cocoous, and various the back bone with his knife and mallet, and slice attached to the schools for lads. the business. I should like to inquire whether perceive a bloody vein, which he must take out. This important branch of domestic industry cocoons are an article of sale within any reason-for if it is left in, that part is apt to spoil. The corners must be squared off where the ham was manure is supplied. For stiff, clayey and sour

In killing a number of swine what sides you may have dressed the first day, lay upon some flags or boards, piling them across each other, and giving each pitch a powdering of saltpetre, and then covering it with salt : proceed in the same manner with the hams, by themselves, and do not omit givng them a little saltpetre, as it opens the pores of he flesh to receive the salt, and besides gives the nam a pleasant tlayor, and makes it more juicy. Let them lie in this state about a week, then turn hose on top undermost, giving them a fresh saltng; after lying two or three weeks longer they may e hung up to dry in some chimney, or smoke iouse; or, if the curer chooses, he may turn hem over again without giving them any salt, in which state they may lie for a month or two without catching any harm, until he has a convenience or drying them. Henderson practised for many ears the custom of carting his flitches and hams nerefore he invented a smoking house.

Henderson's smoking house is about twelve feet mare, and the walls about seven feet high; one f these huts requires six joists across, one close each wall, the other four laid asunder, at proer distances. To receive five rows of flitches, iev must be laid on the top of the wall, a piece I wood strong enough to bear the weight of one itch of bacon, must be fixed across the belly end f the flitch, by two strings, as the neck end must ing downwards; the piece of wood must be loner than the flitch is wide, so that each end may ist upon a beam; they may be put so near each her as not to touch; the width of it will hold ventyfour flitches in a row, and there will be ve rows, which will contain one hundred and venty flitches; as many hams may be hung at et of the floor, which must be covered five or x inches thick with saw dust, and must be kined at two different sides; it will burn, but not use any flame to injure the bacon. The door le in the roof, so that part of the smoke may cend. That lot of bacon and hams will be ready pack up in a hogshead to send off in eight or n days or a little longer if required, with very tle loss of weight. After the bacon is salted, it ay lie in the salt house as described until an order received, then immediately hang it up to dry. enderson found this smoke house to be a great ving, not only in the expense and trouble of aploying men to cart and hang it up through the untry, but it did not lose near so much weight by is process.—Loudon's Ency.

GROUND OYSTER SHELL AND BONE MANURE.

The great value of ground oyster shells as a

land, burnt shell is undoubtedly much the best; cation of manure, a proper discrimination is necessary to the appropriation of that which is best adapted to the different kinds of soil. Hence the great utility of a knowledge of agricultural chemistry. A very partial acquaintance with this branch of chemistry, however, will enable any farmer to distinguish between soils which require lime and those which require ground shell. We were called a few days since to examine a mill creeted by Mr Cragg, in Old Town, near the fall, for grinding oyster shells, and were highly gratified with the visit. Mr Cragg has at a considerable expense erected a mill, and can supply any quantity of the ground shell at about 6 cents a bushel. This we believe will be the cheapest and best manure that can be applied to lands adapted to its use. Gardeners near the city will find especial benefit from its application, as it will not only prove immedibrough the country to farm houses, and used to ately effectual, but eurich their soil for many years. ang them in their chimneys, and other parts of There are some vegetables that absolutely require he house to dry, some seasons to the amount of this species of manure to bring them to the state we hundred carcases; this plan he soon found of perfection of which they are capable, and inttended with a number of inconveniences and deed which is natural to them. Of this class are all marine vegetables, such as asparagus, seakale, &c. It is believed that if asparagus beds were once well dressed with ground oyster shells, they would vield much more abundantly and much finer asparagus than they do with stable manure. For that such manure is essential to the perfection of vegetable is found in its natural state nowhere but on the sea-coasts, where it can have the advantage of marine manure.

We hope ere long, to see mills creeted for grinding bones also. It is believed that they would be very profitable around cities, where bones can be the continent for manure. Gentlemen who have examined the mills for grinding bones in England, ust be kept close, and the hut must have a small represent them as resembling our cast iron bark mills, the only difference being in their larger size and stronger constructions. They generally conthe one for breaking the bones into small pieces, and the other for grinding them into powder. are composed of a large portion of lime; and on account of this animal matter they are suitable for all kinds of vegetables containing any considerable portion of gluten, such as wheat and other grain, beans, peas, and a variety of others. We hope Mr Cragg will meet with such encouragement in grinding oyster shells, as will induce him to commence grinding bones also .- Am. Farmer.

As soon as the milk is strained, it live coals to the front of the fire place, and apply

should be put into pans and set in the coldest place that can be found, in order that it may freeze speediand thus in this, as in all other cases of the appli- ly, the sooner the better. By the process of freezing the cream is forced to the top, and may be taken off without the least mixture of the frozen milk. The cream should never be placed on, or even near the fire, nor kept in a warm place, but when churned should stand several feet from the kitchen fire. It takes a little longer time to churn, and the butter is usually of a somewhat lighter color; but the flavor, when the above directions are carefully observed, is of the finest and richest description. We speak from personal knowledge of the subject, having been personally acquainted with the quality of

TEW ENGLAND FARMER.

BOSTON, FRIDAY, JANUARY 7, 1831.

Directions for the Management of Hothouse fireplaces constructed with Double Doors and Ashpit Registers. By William Atkinson, Esq., F. H. S.; read before the London Horticultural Society.

After the fire is lighted the fire place door should he kept close, and no more air admitted by the ash pit door than is necessary to make the fire burn briskly,-not violently,-because that increases the waste of fuel, without increasing the heat. At all times, the air that is nesessary for blowing the fire must be admitted at the ash-pit door proof of this let any one examine the natural growth or register, in order that it may get heated in passof asparagus on the shell banks on the shores of ing through the fire to the flame. When air is of the inlets along the southern sea-coast. And admitted to the fire place door, it will generally rush over the fire place into the flue, without beseakale, is proved by the fact, that this excellent ing heated, thus tending to cool the flue instead of heating it.

When the flue is properly heated, and the fuel burned nearly to redness, scarcely any air need be admitted by the ash pit door; in most cases the fire will burn with what air gets through the crevices in the iron work. The damper also should be abundantly collected; and the cost of them would put in as far as it can be, so as only to keep the ie same time above the flitches, contrived in the be trifling -scarcely more than the expense of fire just alive, and prevent as much as is practicaest manner we can. The lower end of the gathering. The value of this kind of manure has ble, heat escaping by the chimney. The object is tches will be within two and a half or three been sufficiently tested in England, where it is to generate heat in the fire place, just as fast and used most extensively. That country pays several no faster than it is required to be given out by millions of dollars annually for bones brought from the flue, for maintaining the temperature of the

Equal quantities of coal and small cinders keep up a steadier fire than either alone. Before adding fresh fuel to the fire, push that which is unconsumed towards the farther ends of the bars, sist of two sets of grinders, one above the other; and apply the fresh fuel immediately behind it, so as to fill up the space close to the fireplace door. When fresh fuel is thrown over the surface of a This is also a very permanent manure, as the bones hot fire, it produces an immense volume of smoke and flakes; when added in front of the fire, much of the smoke given out is consumed in passing over the partignited. When fuel is thrown to the farther end of the fire, or into the throat of the flue after the fire has burned low, and the flue is hot, the heat of the brick work distils gas out of the coals: this gas gets into the flue, and when the fuel over the fire becomes in flames, if the flame be drawn into the flue, it ignites the gas that has Winter Butter. - Butter is made in some parts of been there generated, and causes an explosion; this anure for light sandy soils, will be apparent to New England through the winter in great perfect ought to be particularly attended to, as an explosion e mind of every agriculturist on a moment's re- tion. The cows are fed on the best hay, that is, of gas in the flue may destroy a valuable collection

It is a common practice with gardeners and riches the soil, and keeps it cool and moist, while and oats ground together, and are kept at night in others, in supplying fuel to furnaces, to draw the the fresh fuel beyond; the proper practice it will abundantly; that since that time all the manure arranged the following report of Brighton Marke be observed is directly the reverse.

Applying the cold fuel next the door, tends to prevent the door from warping by the heat of the fire. When not in use, all the external parts of a furnace ought to be cleaned and oiled to prevent rust. Apply your own hands to the handles in opening and shutting, and not the spade or shovel, as is frequently practised, and very injurious. A short spade and a short rake, wholly of iron, are all the tools required for the garden furnace.

[Prepared by the Editor of the New England Farmer.]

FOR THE NEW ENGLAND FARMER.

THE MIDDLESEX REPORT ON FARMS.

MR EDITOR-I noticed in the New England Farmer of last week, a communication signed 'A Small Farmer,' complaining that no premium was awarded to William Buckminster, Esq. of this place, by the Middlesex Committee on Farms.

Mr B. may or may not have been concerned in getting up that article, but as he is known to commend it, it is of less consequence to settle that question. The author of the article we will let pass. If the article had been a fair criticism on the Report, although the propriety of awarding a premium on my farm is called in question, I should not have troubled you or myself with this notice of That the public may make proper allowance for the scribbling of 'each ambitious candidate for a premium.' I shall give you my real name.

The 'Small Farmer' takes the article of stock as a criterion. Doubtless this is an important item to be taken into consideration. It will always happen, however, that though there are many facts and circumstances which belong to all farms in a farm of Capt. Daniel Chandler, of Lexington. greater or less degree, yet there are very many It is made of two parts, joined together by hinges others which belong only to a part; the condition of several farms may be exceedingly unlike and can be raised and swung over on to the other half, various in many particulars; and it was strikingly the case in the present instance. The many particulars stated in the Report, and probably many others which it would have been tedious to enumerate, were doubtless considered by the Commit-

to Mr Buckminster, (whether made known to the committee or the 'Small Farmer,' I will not say) which, if taken into the estimate, would have given different results. The first is that the 'four cows' which are supposed to have been kept in the pasture the past season, have enjoyed the principal benefit ning at large. The other is, that the 'two horses' have been fed very plentifully with grain, most of which was not raised on the farm.

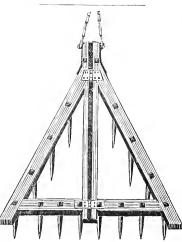

The article in question, however, does allude to some other considerations, and as few will probably take the trouble to compare with the Report, I must give one sample of the 'Small Farmer's'

The Report is represented as stating that ' Capt. Wheeler has purchased for nine years the whole manure of the largest stable in the county; he sells no hay.' The reader would understand the nine years last past, and that no hay had been sold during that term. Now hear the Report. It states that in ISO9, 'the farm had run to waste,' &c, that the manure from the tavern was put on the farm from 1810 to 1818 inclusive; that in 1819 the farm was in a good state of cultivation, and produced

has been made on the farm; no hay has been sold for four or five years last past. Mr Editor, I have done. 'I hope, Sir,' you 'will not despise' the Small Farmer.

Respectfully, yours, ABNER WHEELER.

Framingham, January 4, 1831.

The above is a drawing of an improved harrow, which we have noticed on the well conducted on the two straight centre pieces, so that one part as occasion requires. Its advantages over the common sort are, that it is less liable to be stopped, or rendered less effective by stones, stumps, or other obstacles; as one side may be elevated, or turned to a perpendicular position, while the other side is proceeding horizontally; and it may be But supposing the article of stock to be a suffi- drawn nearer to large rocks, plants, fruit trees, &c, cient criterion by which to judge, there are two than the common harrow, without risk of injuring facts, not contained in the Report, but well known them. It will, likewise, better adapt itself to ridges and hollows, as will be evident on inspection.

One of the above harrows can be seen at the Agricultural Warehouse in this city.-We had taken some further notes, some time since, respecting the judicious management on the farm of Capt. Chandler, but at his suggestion, have deferred however not exaggerated. Swine.

The above is gathered from our weekly reports and may be considered nearly correct as to num bers, but as to sales we may have erred. It i the weekly reports the Beef Cattle have not bee. divided from the Stores, but we have come to division, as near as we could, from our judgmen at the time.

In 1828, ten weeks from Sept. 29, (which are all the minutes of that year we are in possessio ot) 21,546 Cattle, 39,831 Sheep and 7127 Swine In 1829, ten weeks from Sept. 28, 21,271 Cattle weeks from Oct. 4, 29,549 Cattle. 60,179 Shee and 7897 Swine. In 1829, six months from Jul 6, 31,479 Cattle, \$1,602 Sheep and 11,702 Swine -In 1830, six months from July 7, 42,319 Cattle 115,863 Sheep and 15,171 Swine.

More Cattle, Sheep and Swine were probably driven the past year to this market, than were eve before in one year. The Beef Cattle, in particu lar, have been, through the fall season, of an un

CURE FOR FROST BITTEN FEET.

Take the fat of a dunghill fowl and rub the place or places affected with it, morning and evening over a warm fire; at the same time wrapping a piece of woollen cloth, well greased with the same fat, round the frost bitten parts. In two or three days thay will feel no pain, and in five or six will be quite cured. If the inner bark of elder, or the leaves of plantain be first simmered with the fat it will be the better.

THE PEAR COLMAR DOWEZ,

It is stated in the Bulletin Universel, that this pear lately originated in the neighborhood of Brussels and is said to contain a rare assemblage of extraordinary qualities; flesh tender, white, and exquisitely melting. The juice abundant, mild, and of an elevated agreeable perfume, equal to the Hardenpont d'hiver. In a note, it is observed that the Hardenpont Pear is the same as the Glouglou; and that the Pear Gloux Morceau de Cambron is the same as the Beurre de Neuve Maisons, and both resemble the Hardenpont, vulgarly called the Beurre d'-

BUDDING.

In the Agricultural Journal of the Pays Bas, it is recommended to reverse the usual mode of raising the back for inserting the buds, and to make the cross cut at the bottom of the slit instead of the top, as is done in Britain: the bud is said rarely to fail of success because it receives abundance of the descending sap, which it cannot receive when it is under the cut.

Mr. L. L. Macomber, of Gardiner, Me. has secured a patent for an improvement in stiffening hats. One weighing only 41 oz. has been doubled up, and put in the pantaloons pocket, whence being withdrawn and slightly shaken, it sprang out into perfect shape. Perhaps these elastic hats may supersede the frightful opera caps with which some young gentlemen disfigure their heads, and which should never be worn by day light.

Bonnets have been made in the interior of New-York of hornets and wasps' nests, which are easily prepared and colored.

A twin watermelon, placed in the office of the Baltimore Farmer, last summer, remains perfectly fresh and green; although it has been handled by thousands.

In relation to the Bohon Upas, or poison tree of Java, a fabulous account of which is going the rounds, Capt. Delano, of Duxbury, in his voyages states that it may be handled with impunity; and the Philadelphia Gazette states that when Java was in possession of the English, a physician of that bity took a portion of the poison gum from a tree.

Anger and Reason .- When a man is angry it will answer no good purpose to attempt to argue a point with him, or to try to convince him that he is wrong either in practice, or in principle. You must wait till the paroxysm of passion has subsided, and the impatient sufferer becomes again a rational

Some will acquire property by selling brick dust, others will become poor by selling gold dust.

A virtuous education, and habits of industry, make a better inheritance for children than a great estate. We are very solicitous to acquire property, but too often care but little what sort of heirs we leave it to.

MASSACHUSETTS HORTICULTURAL SOCIETY. Saturday, January 1, 1831.

FLOWERS.

The following varieties of Camellia Japonica were exhibited for premium by David Haggerston, from Charlestown Vineyard: Double White, Carnation, Warratah, Pompone, Paroniaflora, Kew Blush, and Double Striped; the following Chrysanthemums by J. W. Russell, from the garden of John Lemist, Esq., Roxbury: Chrysanthemum Indicum flore pleno alba, or Double White Indian Chrysanthenium.

Do. do, flore pleno lutea, or Double Yellow.

To Correspondents .- A communication from Philadelphia was received too late for this week.

Errata. - The reader is requested to make the following corrections in New Easthnoil Primer page 177—a part of theorems, which is made in transfering. Stock for Sale.,

For sale, a fine MERINO RAM, imported last spring from St Andero. He may be seen in this city. Apply to J. B. RUSSELL, office of the New England Farmer. Also, a fine red COW, (now with calf) of the Short

Horn breed-very gentle, has given from 12 to 16 quarts at a milking-may be seen in ten minutes' ride from Boston. Price \$50. Apply to J. B. Russell, Farmer office.

Ammunition 3

Jan. 7.

Of the best quality and lowest prices, for sporting constantly for sale at COPELAND'S POWDER STORE, 65 Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be refunded. tf Jan. 7.

Suxony Sheep.

46 Rams, one and two years old, and 25 Ewes, do. do. raised by the subscriber, from first rate imported stock. Also, 100 half and three quarter blood Saxony and Merino Ewes, one, two, and three years old.

For sale at his Farm, at Flushing, L. I.

EFFINGHAM LAWRENCE.

Cocoons.

A fair price will be given for good Cocoons, of which the moth has been destroyed, by 3t D. JOHNSON, No. 5, Exchange Street, N. York.

Mason's Pocket Farrier,

Comprising a general description of that noble and useful animal the Horse; fifth edition, with additions. To which is added a Prize Essay on Mules. By S. W. Pomeiov, Esq. of Brighton, Mass And an appendix, containing observations and recipes for the cure of most of the common distempers incident to Horses, Oxen, Cows, Calves, Sheep, Lambs, Swine, Dogs, &c, selected from different authors. And an Addenda, containing the annals of the Turf, American Stud Book, mode of training, rules of Racing, &c.

Just published and for sale by R. P. & C. Williams, IS and 20 Cornhill.

Also, on liberal terms, a large assortment of Agricultural, Historical, Theological, Law, and other Books. Persons selecting Libraries, will find it for their advantage to call. Dec. 31.

Black Current Wine.

For sale at the Agricultural Warehouse, 52 North Market Street-

A few dozen bottles of superior old Black Currant Wine, made by a gentleman in this vicinity; an account of its astringent and detergent properties in various complaints, and particularly the Sore Throat, will be found in the New England Farmer, vol. v. page 567, written by Samuel W. Pomerov, Esq. and the late Dr John G. Coffin. Price 75 cts. per bottle-also, a few bottles of old White Dutch Current Wine, price 50 cts. per bottle, Dec. 31.

Wanted,

the Farmer office, Boston. Dec. 24. Durham Short Horns,

For sale, several of the pure breed, descendants of the celebrated animals presented by ADMIRAL SIR ISAAC COFFIN, to the Massachusetts Society for the Promotion of Agriculture. The pedigice of these animals can be given as far back as Hubback, who was calved in 1777, and is reputed the foundation of this much admired stock. Also, several Heiters bred from the same, of various grades, from half up to seven eighths blooded animals. For particulars, inquire of E. Hersey Derby, Salem. Salem, October, 1830.

Prime Orchard Grass Seed, &c.

For Sale at the New England Seed Store, No. 52 North Market Street, Boston,

A few bushels of Prime Orchard Grass Seed, raised by the Hon. NATHAN NOVES, of Newburyport, expressly for this establishment. This is remarkably pure and fine, being wholly free from chaff, white weed, Canada thistle, or any weeds, as the grass was not mowed, but the heads cut off separately, received into a bag, and then spread on sheets to dry, before being threshed. Farmers who wish to secure some of this seed, of the very first quality, are requested to apply soon.

Also, seeds of the Martynea Proboscidea, one of the finest articles for pickles. This is raised to much better advantage by planting in the fall

AARON TYLER, of Bath, Maine, having commenced an Establishment for the Promotion of Agriculture and Domestic Economy, and having made arrangements with Mr. J. R. NEWELL, and Mr. J B. RUSSELL, of the Agricultural Warehouse, Boston, for a supply of the most Improved Tools and Seeds, recommended by them as valuable and useful to be introduced-will be enabled to supply the farmers in Maine at the Boston prices, with the addition of freight. Persons on the Kennebec, and vicinity, will find it to their interest to call at Mr TYLER's establishment for their supply of farming Tools and Garden Seeds.

A. Tyler also tenders his services to the horticulturists and nursery men of Massachusetts and elsewhere, for the sale of all kinds of Trees, Vines, Plants, &c, and will be at all times ready to fill orders for the best of Forest Trees, from Maine, put up and packed properly and shipped according to order.

A. T. flatters himself by close application and assiduous attention to the above objects, that he shall be enabled to give satisfaction to the public, and be a means of introducing into Maine many valuable productions, heretofore unknown, and thereby be a source of improvement to the agriculturist, and of gratification to himself.

A. T. also tenders his services for the sale of Improved

Breeds of Cattle and Sheep.
WANTED, a full blooded Bull, 3 or 4 years old, containing the best breeds for Milk and Oxen.

Letters (post paid) will receive prompt attention.

Refer to Hon. Joseph Wingate, Bath, " H. A. S. DEARBORN, Roxbury. epotf.

Treatise on Bees.

Dec. 10.

Just received and for sale at the Seed Store connected with the New England Farmer, 52 North Market-street, A further supply of a Practical Treatise on the Management of Bees; and the Establishment of Apiaries, with the best method of destroying and preventing the depredations of the Bee Moth. By James Thacher, M. D. Price 75 cents.

Silk Cocoons wanted

Cash and a fair price will be given at the New England Seed Store, No. 52 North Market Street, for about 20 lbs of prime Silk Cocoons, to be delivered soon.

New Work on Farriery.

Just received and for sale at the Seed Store connected with the New England Farmer Office, No. 52 North Market Street,

The Veterinary Surgeon; or, Farriery taught on a new and easy plan: being a treatise on all the diseases and accidents to which the Horse is liable; the causes and symptoms of each, and the most improved remedies employed for the cure in every case; with instructions to the Shocing-Smith, Farrier, and Groom, how to acquire knowledge in the art of Farriery, and the prevention of Diseases. Preceded by a popular description of the animal functions in health, and showing the principles on which these are to be restored when disordered. By John Hinds, Veterinary Surgeon. With considerable additions Volumes 2, 3, and 6, of the New England Farmer, to and improvements, particularly adapted to this country, complete a set, for which a liberal price will be paid at the Farmer office. Bestern Surgeon, and Member the Farmer office Bestern Surgeon, and Member the Farmer office and the surgeon of the London Veterinary Medical Society. Price \$1,25.

MISCELLANY.

THE CARRIER'S ADDRESS

TO HIS PATRONS.

AGAIN the knell of parting Time Demands our bulletin sublime, Descriptive of his general movements, Backslidings, whim whams and improvements; Which notes each notable affair 'T is fit oblivion should spare, And we preserve in peerless pages, For benefiting future ages.

Though true it is, the recent year Was fair as most which time's career, In our untoward clime evolves, Some malecontents have passed resolves That they in fact have suffer'd more Than ever martyrs did before -That Job's afflictions, wife, and all, Would less their fortitude appal, Than ills assailing them, by reason Of last year's unpropitious season :-That insects, blight, cold storms and frost, Made farmer's work all labor lost, And them as needy as a mouse, Whose domicil's a meetinghouse, Such as were built in days of yore, Its basement story not a store. But this is folly's zenith sure, This life, although no sinecure, Presents no pretext to repine,
And n an's by no means made to whine,
Or eriminate his great Creator, For ills which wait on human nature; Though certain of the rhyming race, Enforce the doctrine bold and base, That man fulfils by lamentation The duties of his destination, The world in which we 're doing penance, Is well adapted to its tenants.

Drizzling and driving storms, 't is true, Make farmers look a little blue, And blight and canker worm's attack May deepen azure sprites to black; But these and other ills are sent, Undoubtedly with kind intent, To indicate the great alloys Of transient sublunary joys Lest erring mortals hold too dear Their fugitive existence here -Should not correctly estimate The blessings of that happy state, Where nothing evil can intrude To mar supreme beatitude.

Kind heaven decrees that every one Life's evitable ills should shun, By doing all that mortals can do; Then all that men can do let man do. To adverse fortune do not yield, Received the field of the field But put each nerve in requisition To meliorate your sad condition.

This year may not exactly suit Your grapes, but ripens other fruit --The squash and melon, lacking heat, Are not preeminently sweet; But products of still greater use, Are most remarkably profuse; Potatoes, corn, and English grain Are more than middling in the main; Pastures are good, and grass turns out Beyond anticipation, stout. Then, Mr Growlaway, 't is meet You take the bitter with the sweet. Shall Providence make you its pet? Is the Great Donor much in debt To worthless worms, for aye complaining, And his supreme decrees arraigning? Be thankful, then, 't is all you ean, And justify God's ways to man.

Much good 's effected by the alliance Of patience, industry, and science; And small annoyances no doubt Great benefits may bring about. Take this example, if you please -

Insects assail my apple trees, And I, by way of counteraction, Wash, prune, manure them to a fraction, Am forced to till them so much better That I become said insects' debtor. Converted to the best of tillers T' accommodate my caterpillars. I treat them with profuse ablutions Of saponaceous solutions, Which double purposes insure, Destroy the worms and make manure, Therefore, if truth were always shown, I should my obligations own, Obejsance make to bugs and worms, And thank the plagues in polish'd terms -Say to Curculiones tru-Ly I am much in debt to you -You hade me gather wind-full'n fruit, (Good Husbandry beyond dispute) And boil it up to feed my swine, And now few orchards equal mine. Vexatious lessons, it is true, Are taught by monitors like you, But useful ones, and such as I For one intend to profit by.

We hope that all the insect race Our entomologists will trace Detecting each throughout the changes Its multiform existence ranges -Tell farmers how they may come at them, Sans being forced to feed and fat them, Until the throngs of Egypt's curses Exhaust their patience, barns, and purses,-Till every tiny depredator, Not licensed by the Legislature, To occupy some privileged quarters, (Like fishes bred in certain waters) Will be as much at man's control As pullets roosting on a pole, With no more chance t' escape us than An eel that 's safe in frying pan -And thus effect th' annihilation Of petty imps of desolation, Tiny, but terrible marauders, That spread destruction through our borders.

We thank our horticultural friends For worthv means to noble ends; They should be crown'd with chaplets fair As art can wreath, or merit wear; Patriots should prize those fabors, which Not only honor, but enrich, Disseminate with liberal hand Substantial blessings through the land. And we ourselves have labor'd hard, By doing good to win regard; By mental efforts have essay'd To match the energies display'd By this improved improving age, When every man may be a sage, The light which science yields is given Diffusive as the light of heaven, — When learning's intellectual blaze Spreads wide o'er earth as solar rays, And wisdom promenades our streets To lecture every one she meets.

But now, may 't please your worship, I 'm About to close my rill of rhyme, By wishing you, through life's career, All that can make you happy here, And in the world succeeding this, A whole eternity of bliss.

January, 1, 1831.

MARRIAGE.

It is needless to caution you against the desperate imprudence of falling in love with a lady who is poor in everything but merit. Nobody commits such a folly now-a-days, since the prodigious advances made by the spirit of the age. Formerly, when 'Adam delved, and Eve spun, poor people might marry without coming upon the parish. But it would be the extreme climax of folly to do it now, when it is impossible to fit out a wife for a walk under a sum that, in those miserable days, would have purchased independence for life. Women of decency never spin anything now, but street-yarn; an article which has the fashionable requisite to recommend it, being entirely useless .- Paulding.

The following letter has been read in Congress an referred to the Committee on Agriculture.

' PHILADELPHIA, Dec. 7th, 1830. Sir: You will receive with this letter a silken flag bearing the colors of the United States. This flag made entirely of American silk, reeled from the cocoon: prepared and woven by Mr John D'Homergue, silk man ufacturer. The coloring has been done by the best ar tist he could procure in the city of Philadelphia, he him self not professing to be a dyer.

The staff of this flag with the eagle measures abou tifteen feet; the flag itself is twelve feet and a half long and six feet wide. It is woven all in one piece, withou

I beg, sir, you will be so good as to present this flag most re-pectfully, in my name, to the honorable Hous over which you preside, as a sample of American indus-try, thus applied for the first time, to the most valuable of American productions; and as a result of the effort they have made during the last five years, for th promotion of the important branch of agriculture, t which we owe the rich material of which this flag composed.

I have the honor to be, with the highest respect, sin your most obedient and most humble servant, PETER S. DUPONCEAU.

Hon. Andrew Stevenson.

Militia Titles .- Our republican love of titles ha long been a standing jest with foreigners; and w are glad to find them going into disuse, except or public occasions. An American, who was presented to Napoleon, was foolish enough to be announced a General, in virtue of his militia honors. 'General of what?' inquired the Emperor, 'Of soldiers, sire But, are you General of cavalry, artillery, or infant ry?' 'Of all, sire.' Napoleon shrugged his shoul ders, 'You must be a great General, then,' said he.

A Boston Alderman used to say, 'I once made bet with a travelling companion, that the landlord o a tavern we were approaching was a militia officer although I did not know him from Adam. My com panion accepted the bet; and I hailed the landlord with 'How d'ye do, Colonel?' You've got the upper hand of me, Squire; rephed he; but never mindwalk in. I'm going to have my rigiment here t muster to morrow. Happy to have you stay and se 'em.'

Tavern-keepers certainly have very strong claim for militia offices; and we apprehend the Alderma: would have been safe in making such a bet ninety nine times ont of a hundred.—Mass. Jour. and Tril

Who reads an American book ?- The Frenc. Chambers being engaged in revising the Crimina Laws of that country, have adopted Livingston's Cri minal Code for Louisiana, as a basis of the propose

To play the fool and marry for love, is to marry Melita, a pretty, young, virtuous and prudent womai of a Irugal temper, and who has a kindness for you but less money than . Egina, who is offered you with an extraordinary good portion, and extraordinary good qualifications to squander it all away, and your own along with it.—La Bruyere,

Published every Friday, at \$3 per annum, payable at the end of the year--but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents

NATUBAL HISTOBY.

THE HONEY BEE.

Concluded from page 195.

Plymouth, Dec. 30, 1630. V. C. SMITH, M. D .-

DEAR SIR-The perusal of your interesting bservations has afforded me the greatest degree f satisfaction, and for which I beg you will accept f my respectful acknowledgments. The subect of bees has for several years occupied a coniderable share of my attention, but for want of a lass hive and a miscroscope I have been unable to ake any particular theoretical discovery or any ew observations respecting their internal economy. am indeed greatly disappointed, and surprised to earn that with your excellent hive you have not ad the pleasure of recognising the queen; such egative evidence however will not shake the eneral faith so firmly established in her majesty's xistence and sovereign dominion. Your queen as undoubtedly in her dignified retirement in te interior of the original hive, while her subjects

Some polite ladies have complimented me with e suggestion that the bee fraternity ought to ect a monument of wax to my memory; but I ill cheerfully resign my claim to that honor in vor of your superior merit. I am exceedingly atified with your history of your 'philosophical iary,' and hope you will continue to pursue your vestigations until you add to our common see 3 me important improvement in the history and aracter of our favorite little insects. Your expeent of marking the bees, has, it seems, satisfied you at there is a class which are employed as archicts exclusively. But still it may be inquired iether they are preferred, as we prefer the most ilful artists, because they are enabled by supeir ingenuity or by long experience to execute the endowed with the faculty of improving by exrience, or deviating from the routine prescribed them by their Creator. In regard to your Dr THACHERservation that bees are sometimes remiss in their pital punishments are inflicted, and that the dead nally are those of the executed criminals. I tnessing the exit of the spider that so audapear strange that bees do not on such occasions ke use of their wings which enable them to rt upon an object with great rapidity. But in the of war it is prudent to attack an enemy by regular proaches, and thus acted the bees towards the der's fortress. Are then these little insect dies inspired by a soul, or can matter think? rely your account of bees' elevating pieces of mb by building pillars under them, and their art-

tion, and all authorities agree, that specific cells are assigned for the reception of honey, and for the eggs which produce the young brood. But, my existence of a ruling queen.

I am yours in all sincerity, JAMES THACHER.

DOCTOR THACHER having presented Doctor Smith's letter to Mrs Many Griffith of Charlieshope, New Jersey, was favored with the following observations from that accomplished lady. DR THACHER-

DEAR SIR-Many are the fibles about bees, but the fact of the existence of the one denominated queen bee is a reality. If anything can be relied on as a certainty in the history of this curious insect-the bee-it is that there is never more than one female in the hive, excepting when a new swarm goes from the hive. One other fact I must mention, which is, that bees do not sting one another. ere in the exercise of their functions in the glass Their mode of warfare is to gnaw or bite each other under the wings. This they do either when engaged in a regular battle in the air, which sometimes occurs, or when they act on the defensive at the door of their hives. I never saw one bee sting another, but I have known them to thrust out their sting when in the agonies of death by smothering; their sting, thus thrown out in madness. will sometimes lodge in the body of another bee, but I am sure that they do not inflict wounds with their sting. By gnawing their enemy under the wing, they disable him from fighting and from entering the hive. They destroy all the drones in this way. I have seen two and three bees at a time gnawing under the wings of one drone; hundreds of drones may be seen crawling on the ground unable to fly; of course they soon perish. I shall send you by the first opportunity a queen ork in a manner more advantageous than their bee, and will send one to your friend Dr Smith mpeers in common? I have no idea that insects also, as I have four of them in good preservation.

(Mrs Griffith's second letter.)

DEAR SIR-You tell me to answer your quesiors, or that coercion is resorted to for the pur- tions at my leisure; nothing but very pressing busise of exciting industry, it is highly probable that ness, which I cannot plead at present, ought to on a large table, and on close search you will find the queen; she is the largest and lightest colored bee in the swarm, with shorter wings and proboscis than the rest. She can never be mistaken in summer for a drone, for he is a larger, heavy made, thick insect, even darker than a working bee, with wings covering its whole body; and she cannot be taken for a drone in winter, for not a conduct towards the spider, similar to the human single drone escapes the general massacre of I cannot concede to your position that an 'egg after September. They are not suffered to live stretched themselves out and expired.

is deposited in every cell of honey throughout the an instant after the vivification of the last deposihive. There appears full evidence on examina- tion of eggs, and they only make their appearance in the spring, at the precise time when they are wanted to hatch the newly laid eggs. You say that I have suggested a new idea respecting the friend, you must no longer be sceptical as to the mode of warfare among bees, and you add that if my suggestions be true, what becomes of Huber's testimony to the contrary ?*

My dear sir, how frequently must you have seen theory after theory crumble away, and others of dissimilar character occupy their place. In medicine-you are a medical man-from Hippocrates down to our Dr Rush, who was the last system-monger, how has each theory prevailed for a time! Huber was undoubtedly an honest man, but he was nearly blind, and when we know how much depends on clear vision, we cannot, or rather ought, not to receive all that he says as correct truth. It is true that his secretary, FRANCIS BUR-MEN, acted for him, but it would indeed be marvellous if this assistant were as deeply interested, of as strict integrity, and as well qualified by genius and talent to investigate so minute, perplexing and difficult a history as HUBER was himself. No stain therefore should rest on the fame of a naturalist so deserving of our respect and admiration. As to FRANCIS BURMEN, I would not accuse him of wilful misrepresentation; he only reported to Huber what he thought he saw. He had some knowledge of the 'doctrine of consequences,' Bees have stings; when annoyed by an animal, they sting it; consequently when enraged by one another they revenge themselves by inflicting a mortal wound with their stings; so reasoned Fran-CIS BURMEN and a host of others. This admitted of further proof, if the shadow of doubt ever passed over their minds, by the circumstance of the curving of the body of the bee when engaged in fight. The fact is, when we consider the length and weight of the lower part of the body compared with the upper part, we shall perceive that this curve is unavoidable : it is a natural contraction of muscles and it occurs whenever the mind is agitated. I have an excellent microscope, and from long practice I can manage it adroitly, but on the closest examination, I have never yet seen a hole in the dead body of a vanquished bee. If bees sting one another, why do they not sting the drones? I have sat for hours during their massacre, for the prevent me from replying to your letter immediately. purpose of ascertaining this fact; but although my dies you have seen thrust out of the hive ecca- it would not be becoming in me, to show less zeal eye was within two feet of the platform, I am cerin a pursuit which is as interesting to me as to you, tain that no sting ever was protruded. It was gret that you were deprived of the pleasure of The four queen bees, were obtained, when dead, really an arduous task to kill a large drone. It from four smothered swarms. If any of your sometimes required two or three bees to disable ously intruded himself into your hive. It may neighbors smother their bees, you can gather up him. The drones have no sting, there was no fear all the dead bodies carefully, and spread them out therefore of their acting offensively, and their death would only occupy a moment of time, by means of

^{*} Huber asserts, that being desirous of witnessing the scene of carnage, he placed six hives on a glass table and placed himself and assistant beneath it. On the 4th of July, the working bees actually massacred the males in the whole six hives, at the same hour and with the same peculiarities. The glass table was covered with bees full of animation, which flew on the drones, seized them by the antennæ, the wings and limbs, and after having dragged them about, they killed the unfortunate conduct towards the spider, similar to the numan intelliarrior, are precisely analogous to human intellince.

single drone escapes the general management of the belly. The moment that their formidable weapon that I have examined, but I never yet saw a drone that I have examined, but I never yet saw a drone foundable measurement of the belly. The moment that their formidable weapon touched them, was the last of their existence; they

a sting. Even when a battle takes place in the ings, by showing what little knowledge I possess their adversary, and were maddened by rage and muck, using a deadly instrument indiscriminately without any preconcerted, or definite plan. And in the case of smothered bees, I have more fremelted brimstone and earth than to one another. I wish I could satisfy myself equally well as to the use of the farina or bee-bread; for the bee-bread, you know, is nothing more than layers of little pellets, well packed down in the cells by the bees. These pellets are put in the cells exactly as they are taken from the flowers, showing when the cell is opened all the different shades of yellow which the pellets exhibited on the thighs of the bees, and only acquiring that uniformity of color and bitter, acrid, offensive taste by heat and age. I am as ignorant at this moment for what purpose this beebread is brought into the hive, as I was when I first commenced the investigation. The maggets are not fed with it, that is certain; and it is quite as certain that it does not enter into the composition of way. The nearest guess that I can make towards the truth is, that it is the principal ingredient of propolis or bee-glue, which you know is distinct in its nature and properties from wax.*

As to wax I consider it as a secretion. I have had no means of ascertaining whether it be voluntarily raised from the stomach, or from any other viscus or organ. Wherever it may be elaborated, its first appearance as wax, is from the mouth. If Dr Smith have any cause to value my opinions, he can soon satisfy himself of this truth. For although he cannot gain much consecutive knowledge by watching the operations of the bees through a glass hive, these insects being very impatient of such inspection, vet for a second or two he can see enough to convince him that wax is a visceral secretion, and not an exudition from the pores of the body, as some authors imagine. I would not hurt Dr Smith's feel-

air, the bees never use their sting. I have, when when it goes to prove him in error. But of what npwards of 20,000 of the slain have laid on the use is my experience, or any experience, if it is ground, seen as many as a dozen bees attached to not to benefit others? The very mistakes that he each other by means of their stings, and during the has made show so much minute attention, and his agomies of death, by smothering, I have frequently remarks are so sensible, that I foresee you will seen the bees with disruptured entrails in conse- find in him an able coadjutor. It will not pain quence of their inability to extract their sting. him, I am sure, to be told that he has started But in both these cases the natural instinct of wrong. When a glass door is suddenly opened, the insect was gone. In the first case these few, the glare of light surprises the bees; they become when they were brought down to the ground by confused and run about without any apparent object. I must except those who are employed in pain, were no longer under the control of their building the comb, they are generally less affected instinct. It is what is understood by running a by external interruption than the other workers, Those bees, too, which come in loaded with pellets of bee bread, will generally move forward and deposit their load, but there is soon a general disquently seen their stings attached to the lumps of turbance, and many false conclusions must be drawn from their mode of proceeding.

What Dr Smith says of dressing or cleaning one another is true; when a bee comes in 'travelsoiled,' one or more bees immediately surround him. relieve him of his pellet or honey, and then nibble at him as it were from head to tail, and when they release him, he is as fresh and vigorous as ever. What the Doctor suggests about punishments is true enough. The bees which he has seen dragged out, apparently in full health, were intruders, or they were disabled in some way or other. If a bee droop on his return from an excursion, and is not invigorated after being ministered to he is immediately destroyed. They do not allow a crippled or sick bee to remain an instant in the hive; there cannot be an idler among them; even those who are apparently idle at the entrance, or on the side of the hive, have some part of the policy assigned them. The noises which are made by the rapid motion of their wings is for some purpose; certainly; when the motion of the wings occurs at the door of the hive, it is to serve as ventilation.'

I am yours, very respectfully. M. GRIFFITH.

TO RAISE HOLLY PLANTS.

Mr Fessenden-I copy a receipt from a work by Mr Philips, ('Sylva Florifera,') which you may be pleased to communicate.

'The English nurserymen have collected 50 different kinds of Holly, all of which may be propagated by grafting on a common stock. The berries like the seed of the Hawthorn, hang on all winter and remain in the earth two years before sprouting-unless they have passed through the stomach of fowls, when they vegetate in one year. We have therefore only to give them a similar fermentation by art to enable us to raise young plants in one year instead of two. For this purpose take a bushel of bran, mix it with the seed in a tub-wet it with soft water, and let it remain undisturbed for 16 days, when the bran will begin to ferment-sprinkle occasionally with warm water to keep it moist, and in about 30 or 40 days the heat of the bran will put the berries in a state of vegetation fit for sowing in about a week after the fermentation has commenced.' (page 290, 1st vol.)

The above may be worth the experiment, as the young plants would sell readily. G. W. B. Yours,

MR COOK'S ADDRESS.

(Continued from page 195.)

It must be obvious to those who have devoted their attention to the cultivation of fruits, that the same varieties will thrive better in one quality o soil, than in another. This is undoubtedly true even of some of the most hardy, and more espe cially of those of the more tender and delicate kinds. The russeting apple affords an example of this ameliorating effect, and will furnish a sat isfactory elucidation of this position. The mos perfect are those which are produced upon elevated or dry soils interspersed with rocks; while those which grow in low and moist lands, possess less of the distinguishing traits of that variety, 1 do not state this so much as the result of my owr practical observations, as from those of more experionced cultivators. Such being the fact in relation to one sort of fruit, may it not be rationally inferred that it should be likewise true of many others? The subject commends itself to our attention with peculiar interest, and I cannot doubt but that it will receive the consideration it merits.

Associations directed to the promotion of horticultural pursuits are of comparatively recent date. It was reserved to that country, from whence the intrepid hand of Pilgrims came, to found an empire in this Western hemisphere, to become the pioneers in this acceptable work, as she had ever been in all others that had a tendency to shed a lustre upon her name, and to impart to other nations the influence of her beneficent and glorious example. The time has passed away, and with it the excitement, I trust, never to be revived. when to speak in commendation of the institutions of Great Britain, would subject the eulogist to the suspicion that he was distrustful of those of his native country. I leave to abler hands, and more gifted minds, the correction of those unmanly and illiberal personalities, that have degraded the literature of England in relation to our manners and habits, and the uncharitable and mistaken views of our government, and the administration of its laws, which have been furnished by itinerant book-makers, in return for the generous bospitalities of our countrymen, and thus made the only adequate return of which they were capable.

The Horticultural Society of London was established in 1805, under the highly flattering auspices of distinguished scientific and practical men, and was the first institution of the kind that had been founded in Europe. It has developed a wide field of operations, and extended its researches to almost every accessible part of the globe. Innumerable specimens of the riches of the natural world have been collected under its direction, and transferred to England, Asia and Africa, and America and Continental Europe, have contributed to swell the catalogue of rare and valuable plants, to enrich and beautify the rural retreats of our father land.

In 1809, the Caledonian Horticultural Society was formed in Scotland, and still numbers among its patrons the first of the nobility and gentry of that loyal nation.

The Horticultural Society of Paris was instituted in 1826, and is rapidly increasing in numbers and in influence. Between the society of Massachusetts and that of Paris the most friendly rela-Mr Myers of New York, has given notice in the tions exist, and are fostered. We have received Legislature of a bill to have but one militia training the most conclusive evidence of their regard, and of their desire to promote a reciprocal interchange

^{*} I readily concede to the position of Mrs G, that farina or bee-bread is not designed as food for the young brood, nor is it an ingredient in the composition of wax, as formerly supposed. But that it is of important use in their economy is unquestionable; it is undoubtedly eaten by the bees, and it has been asserted by some writer that a hive of bees, however amply supplied with honey, cannot subsist through the winter without a store of bocbread. It is apparent to every observer that these insects are employed from the latter part of March, to late in October, in collecting pollen as well as honey, and storing it in their hives to a very considerable amount. One writer has asserted that there has been found in a single hive the extraordinary quantity of one hundred pounds From this fact it may be concluded that faring is not intended for the formation of propolis, of which a few ounces will suffice all the purposes of a hive; tarina moreover possesses no agglutinant property, which is essential in the formation of bee-glue.

It may be noticed as proof that bees eat bee bread, that, in the spring especially numerous yellow spots are that, in the spring especially hadnesses, joine having the observed on the floor board and about the hive having the preatance of farina evacuated by the bees.

Mease's edition of Willich's Encyclopedia, article Bee-bread.

our mutual pursuits.

We have invited the cooperation of the several Horticultural Societies in our own country, to participate with us in extending the influence, and xpressed a desire to be identified with them in we wish to see its benefits become co-extensive His word. with the limits of our land. Whatever of good nay result from our industry, or be achieved by our exertions, must be seen and felt, and will, I rust, be acknowledged by the community.

A taste for rural pursuits and improved culture ias been widely diffused through the influence nd example of this society. An emulation has een excited which has been productive of highly ratifying results. The weekly exhibitions at our Iall the past and passing season, have furnished ndeniable evidence of the truth of this assertion, he increased varieties of beautiful flowers, and d our anticipations, and more than all these, are ne gratifying effects that have followed those exeard from those who have attended them. We annot be insensible to the commendation of our dlow-citizens; we ask for their support and enouragement; and I feel assured that a generous id tasteful community can never be unmindful of ie importance of sustaining an institution that ontributes so essentially to the supply of their mmon necessities, and administers so abunditly to the happiness of the healthful, and the soce of the invalid.

The varieties of soil and of climate with hich our country is diversified, are favorable to e growth of almost every plant, which nature elds to the wants or the tastes of man. The agnolia, the tulip, the judas, the laurel, and other wering trees that may vie in beauty and fraance with almost any of the exotic plants, are digenous to our forests, and are improved by ltivation when transplanted to appropriate situans. And we are indebted to the provident care nature for the origin of many of our most valble esculents which have become ameliorated culture, and which use has rendered in a meare indispensable to our convenience and com- dinary use of the fruit.

In the interminable forests where the voice of rilized man penetrated, where the silence of nare has continued undisturbed since the earliest wn of creation, save by the howlings of the unned enemies of our race, or the murmuring of iters rushing to their appointed destination in Iden meanderings, or gliding in silvery brightss through verdant meadows, and over rocky ecipices, tumbling in wild and fearful confusion o the deep chasm, thence flinging their glitterspray upwards, mingling in sunbeams, and aging midway in the heavens the transient inties of the bow of promise! - there, where ture reposes in her lofty, but rude and simple indeur, in coming years, though perhaps rete, men from all sections of this vast country. the far-off borders of the Pacific Sea, under the

of opinions and sentiments upon the subject of will be established, where the cheering light of ser | dence. A white exterior, which presents a pleasence and the arts shall blend their influence, and ling contrast to the green vestments, the prevailseminaries of learning will be founded, that shall ling coloring of nature in her rural empire, is pregive to mind its power and to man his merited elevation, and a taste for all that administers to imparting a taste for rural employments. We have the improvement of social life, and the diffusion of the means of social happiness, and Gop shall the general design of our labors. We founded be worshipped in temples conservated to His serthis institution for purposes of public utility, and vice in the simplicity, and truth, and power of

In this future vision, that is not destined to bless our sight, but is reserved to future generations to look upon, may we not hope that the influence of those principles we now commemorate may be implanted and widely diffused?

It is a common observation of travellers, that in the interior portions of New England, remote from populous towns, very little if any attention is given to the cultivation of good fruits, and it is equally true that many of our substantial practical agriculturists in those regions, deny themselves even the convenience or luxury of a kitchen garch fruits, and fine culinary plants, have surpass- den. Mankind must be permitted to stint themselves in the enjoyments of the bounties of nature if such be their pleasure. If indifference or parsiibitions in the expressions of delight we have mony induce such self-denial, and they who practise it were alone inconvenienced, it is matter with which a stranger need not intermeddle; but inasmuch, as such a disuse of the bounties of heaven are detrimental to the public at large, we may rebuke the unpatriotic spirit by which they are in-

> It is worthy of remark, that in all parts of the continent of Europe where fruits are abundant and cheaply procured, a greater degree of temperance in the use of intoxicating liquors is prevalent among all classes of the inhabitants than elsewhere. This consideration alone, commends the subject most forcibly to the general favor, and in an especial manner to those philanthropic men who are devising plans for the suppression of that debasing and destructive practice of intemperance. Horticultural societies are in a measure auxiliary to this benevolent design, in administering an antidote to that baneful indulgence which makes havoe of the mind, by furnishing a substitute in the wholesome beverage expressed from the apple, the pear, the grape and the current, as in the solace to be derived from the natural and or-

Rural architecture may not inappropriately claim a passing notice on the present occasion. ilized man has not been heard, nor the foot of It has not hitherto, here, received the attention it deserves. One reason why it has not, is probably the unwillingness, or the apprehension of incurring an expensive outlay, without the immediate prospect of an adequate return. This, I think, it may be made apparent, is more imaginary than real. It is not to be denied that large sums have been injudiciously expended in the construction of some of our rural retreats, and more especially in the erection of the house, the preparation gravel-walks, the construction of observatories, artificial caverns, fish-ponds, etc. Those who possess the means, have an unquestionable right to gratify their tastes, and indulge their fancies, in others, with more limited resources, may not pro-I from nations beyond the sea, will be gathered cure as much satisfaction by a less conspicuous ether, and from the shores of the Atlantic Ocean display of their tastes and their fancies. Durabilt towns and cities will arise, and associations house, are all that is essential for a country real-Inecessity of attending to business.'

ferable to any other. The artificial embellishments of the exterior of the house are of secondary consideration. The honey-suckle, the big nonia, the eglantine and the woodbine, intermingling and entwining their flexible branches, and attaching themselves by their tendrils, or other means with which nature has provided them to any object that will afford them support, or artificially secured and tastefully arranged, will present a far more pleasing aspect than the ingenuity of man can devise, or the application of art accomplish. But it is upon the grounds that the taste of the proprietor should be exhibited; this can be effected at comparatively little expense. Blost of the native, and many of the foreign varieties of ornamental trees and shrubs, may be raised from seeds, and a nursery thus formed, will in a few years afford a sufficient supply to occupy the borders or other places designed for their reception. Collections of many desirable kinds may be procured from the contiguous forests. The work of preparing the borders or divisions of the enclosure to be appropriated to the location of the plants, may be done at intervals when leisure will permit, or when it will not interfere with more important duties,

The gravelling of garden avenues may be dispensed with, The ordinary soil, levelled and laid smooth with the roller, will present an agreeable surface with less labor and cost than the former. Grass edgings are preferable to those of box; their symmetry can be preserved with less care, and are less obnoxious to the charge of the treasonable practice of affording shelter and sustenance to myriads of insects which prey upon the delicious products of the vine and other rare fruit.

To be concluded next week.

DR Faanklin .- Charles Thompson, the secretary of congress, said he well remembered the circumstance of the first introduction of broom-corn into our country. Dr B, Franklin chanced to see an imported corn whisk in the possession of a lady, and while examining it as a novelty, he espied a grain of it still attached to the stalk. This he took and planted, and so we at length have got it in abundance among us.

The yellow willow among us was introduced from a similar accident, as told me by T. Matlack, Mrs D. Logan, and Samuel Coates. All in our state came originally from some wickerwork found spronting in a basket-state in dock creek. It was seen by Dr Franklin, who took it out and gave the enttings to Charles Norris of that day, who reared them at the grounds now the site of the Bank of the United States, where they grew to great stature .- Watson's Annals.

Admonitory Sentence.-The late Rev. Dr Gardiner of Boston is represented in one of M. Carey's essays on the charities of Philadelphia, as having said-'My dearly beloved Brethren, let me solemnly assure you, that some of you might appropriate five, some ten, some fifteen, some twenty such expenditures, but it does not follow that thousand dollars a year, for charitable and benevolent purposes, and still retain enough to ruin your children. Mr C. very justly remarks, 'What a lesson! how little regarded by parents in general! How ity in the materials selected, and convenience and fully borne out by the career of a large number of ptecting ægis of our insignia of liberty, villages, simplicity in the design and construction of the those who inherit independent fortunes, without the

INTERNAL IMPROVEMENT.

The Petersburg (Va.) Rail-road Company, we observe, are making preparations for an active and vigorous prosecution of their work in the ensuing spring. They have invited proposals for furnishing the requisite timber for six sections of the Road, of ten miles

South Carolina .- About six miles of the Rail road leading from Charleston are completed and the work is in rapid progress. The papers announce the arrival of a locomotive engine, made in New York. As soon as a section of the Road is finished it is brought into operation for the passage of coaches.

Eintucky.-The engineers of the Lexington and Ohio Road are engaged in the surveys of the rout of the road. The result, so far as they have advanced, shows that the country is peculiarly favorabic for the construction of the work.

Read Company have the whole of their line under contract for graduation. The Camden & Amboy Rail read Company have invited proposals for furnishing 30,000 stone blocks for the construction of that road. The road has been commenced at Camden.

Maryband.—The First Division of thirteen miles of the Baltimore and Ohio Railway continues to be kept in active and profitable operation by the numerous visiters, citizens, and strangers from all parts of the country, who are daily making excursions on it. The various parts of the unfinished lines are advancing with a steady progress, and will soon contribute their share of interest and productiveness to the general undertaking.-Baltimore Chronicle.

The Schuylkill Valley Rail Road which has been in full operation the greater part of the present season commences at Port Carbon, and terminates at Tuscarora, a distance of ten miles. There are also 15 lateral Rail Roads intersecting it, the distances of which combined, will amount to about ten miles-The main branch cost \$55,000, and the laterals, we presume, about \$20,000.

The Mill Creek Rail Read (which has also been in operation the present season) commences at Port Carbon, and extends up Mill Creek four miles. This road cost about \$14,000. There are about three miles of lateral road intersecting the main branch, which cost about \$2000 per mile.

The West Branch Rail Road (one track of which is now in operation) commences at Schuylkili Haven and terminates at the foot of the Broad Mountain .-The length of said road, including the West Branch will be 15 miles, and will cost upwards of \$150,000. There are also about five miles of lateral roads intersecting it, the average cost of which will be about

The Mount Carbon Rail Road commences at Mount Carbon, and extends up the two branches of the Norwegian, a distance of nine miles, which will cost about \$100,000. A number of lateral roads on this have also been commenced.

RECAPITUI	LATION.	
	Miles.	Cost.

Mill Creek Road	4	14,000
Laterals intersecting do	3	6,000
West Branch Road	15	150,000
Laterals intersecting do	5	10,000
Mount Carbon Road	9	100,000
Γ otal	56	\$355,000
	J	Hass. Journal

The following Rail Roads have been commenced in this county:

The Pinegrove Rail Road, which extends from the Mines to the Swatara feeder, a distance of five miles. This road will cost about \$30,000, and be completed early next season.

ortnes, a distance of about 23 miles. This road, it is pregnated with the usual animal and vegetable expected, will be completed next season, if laid with wooden rails. If iron rails should be concluded on. the time for completion, of course, must be extended. This road, if constructed with wooden rails, will probably cost \$250,000-if constructed with iron rails, about \$400,000. Making A miles of Rail road, at an expense of \$.635,000.

All the above Rail Roads have been commenced within the last two years, and when completed will The trees got worse, and were again taken up an yield a fair per centage on the capital invested.— Miner's Journal.

vantages from her canal. It has been opened for one of the most productive in Scotland, was tw navigation since July last. A Rochester, N. V. paper, says that 200,000 bushels of wheat had been received from Ohio-they pay from ninety to ninetysix cents per bushel-their nells make Belavare. - The New Castle and Frenchtown Rail 2,000, and can make 3,000 barrels of flour per day. In twenty days, \$50,000 in cash was sent into Ohio for produce."

The foregoing paragraph is taken from an eastern paper, and shows practically the influence of the canal, on the presperity of our state. The price of wheat we are informed is, in the interior counties near the canal, nearly double what could be given for it without the advantage of canal transportation. It will therefore readily be perceived, that, from the immense quantities of produce which our state affords, the additional price which it now commands will, in a very short period of time, increase the wealth of the state,of the farmers-to an extent far beyond the cost of the canals. Practical demonstration is thus given, of the wisdom of the policy which dictated the construction of these works; and when they are completed, and the tolls become as productive as they must necessarily become, the revenue they will yield must remove all pretext for complaint respecting the canal policy.

We have been informed of an advantage that the adoption of this system of policy has produced to the state, which never entered into the calculations of its friends. It is said that a number of farmers have been induced to sell their farms and leave the state in order to avoid the payment of canal taxes. It is a decided advantage to any community, to be relieved of such stupid, wrong headed men, as will not consent to bear a portion of the expense necessary for the general improvement of the country, when, like that of the improvement of their farms, it brings tenfold advantages to them, The places of such men, will always be supplied by more valuable, useful and intelligent citizens.

Western Tiller.

COAL ASHES.

The Gardener's Magazine says, it does not seem to be generally known among gardeners, that cinders, whether large or small, are injurious to the roots of many if not of most vegetables. A few days ago in shifting a few roots of chrysanthemums, we observed some of the plants looking much less healthy than others. On turning the unhealthy plants out of the pot, we found that instead of potsherds a large handful of pitcoal cinders had been used for draining them. On turning out the healthy plants, potsherds had been employed as usual and the roots were matted about them, while no roots had penetrated among the cinders. On directing the attention of a horticultural friend to the circumstance, he related the case of a large garden in Scotland which had been manured or coated The little Schnylkill Rail Road commences at over with coal ashes from a neighboring town for Port Clinton, and extends up said stream to the two years in succession; which ashes though im-1—the sheep all huddled around in a circle, with

matters, displayed their deleterious effect both o fruit trees and culinary vegetables, not less than i the chrysanthemum pots. The gardener finding hi finit trees not to thrive so well as he expected, bu attributing it to a different cause, took up a num ber of them, and formed a substratum of ashes i order to lay them, as he said, dry and comfortable the ashes removed; but such were the deleteriou effects of the ashes already worked into the soil "The state of Chio is already deriving great ad- that this garden which previously was, and now in or three years before even moderate crops could b

> WARMING HOUSES .- There is much popula ignorance prevailing on the subject of warmin and ventilating houses both among the Englis and Anglo-Americans. One would have though that the advice and experiments of such men a Franklin and Rumford would have dispelled the llusions about people being more liable to cate cold when a regular and uniform heat is kept u in their apartments, than when these are traverse by currents from doors, windows, and every crevice all rushing towards an open fire. But prejudice are hard to be overcome-the more so indeed the more beneficial their abandonment. If w were really made hardier, and acquired exemptio from the complaints so common in our variable climate, during the autumn, winter and sprin months, by the common practices of using ope: fires,-single windows and doors, we might giv up the comfort of the opposition plan: but n such good follows our exposure: no frame, how ever vigorous, is exempt from the assaults c streams of cold air in our houses .- This is not however, a matter of theory, or to be argued fror individual experience .- National usage, in th coldest climates in Europe, is decisive on thi point. The Russians, Finlanders, and Swedes, c all classes, are not ashamed to keep up nearly summer heat in their houses during the winte months-they have no fears of being called effeminate. On the contrary, allege, that in sally ing out from their houses into the external frost air, they are able to bear and even enjoy this kim of exposure, or zir-bath, the better from their previous warmth-precisely for the same reason that a person with a vigorous circulation of the blood, and hot skin, is better enabled to bear the shock of a cold bath. In the opposite circum stances, of immersion in cold air or cold water when a person is chilly and with pale skin, as when coming out from a cold room and imperfect ly clad, he will suffer greatly, and be less able # resist the secondary and morbid effects of cold Rumford declares that, notwithstanding his first preindice against stove heat, he found, from at experience of twelve years' residence in Germany not only that warm rooms were more comfortable in winter, but also certainly tended to the preservation of health,-Journal of Health,

THE DARK DAY.

Hon. Wheeler Martin has tayored the editor of the Providence Subaltern with the following recoffections of the Dark Day in 1780.

The dark day was on the 19th of May, 1780. where I resided at that time; the darkness at 11 o'clock was so great, that a candle was lighted and placed upon the table ;-the fowls went to roost;

their heads inward. The grass, to look at it through the window, seemed of a yellow green; half a bushel of corn, all of which was bartered the same as to look through smoked glass upon for rum, even when his family needed it for their green grass.

I well remember, that the gentleman of the o his numerous family :

'The sun shall be turned into darkness, and the noon into blood, before that great and notable day of the Lord's coming.

The darkness was so great in the night time, that it was said by one Doctor Blackington, who resided near the northeast part of Rehoboth, who and occasion to be out among his sick patients that other had his arm broken in a drunken quarrel. night, that he could not see his white pocket handkerchief placed before his eyes. The darkness was so thick that it could be felt.

The year 1780, was celebrated for the many northern lights; they covered the whole horizon iver :- they would flash like lightning and fill the ir with the smell of sulphur. The lights were so ed, that the flashes would bring warmth against he face.

The great snow fall was in December, 1779, or fanuary, 1780. It snowed seven days; the snow vas estimated to be four feet on a level, and the lrifts from eight to ten feet high. The snow came noist and coarse, and it was so cold that it concealed very hard. The people travelled over stone walls with their teams. It was said to be a fact, hat for thirty days, the snow did not melt from the eaves of the houses on the sunny side. The banks vere so high, that sheep were buried up in them, and there remained for forty days, until they were bund by their air holes, and dug then out alive.

This year the whole of the Narragansett Bay vas frozen over so thick and hard, that the late Ionorable John Brown passed from Providence on the river of ice, to Newport, and back, and I clieve some went on skating parties the whole ange, Gen. William Valentine sleighed wood rom Fall River to Newport, on the ice, through

The people of Newport burnt their furniture s keep themselves from freezing. The British rmy had left the island of Rhode Island in Noember, 1779, and stripped the people of all their aluables. In a manner the years of 1779 and 780, were the hardest winters known for a century ast past.

The weather was so severe in the winter of 780, that many people were frozen to death. A To Nathan Brooks, of Acton, for 36 1-2 bush. nan went from Attleborough, Mass, with a load of loops to Boston, and was caught in the great storm; and returning home, was frozen to death, coming off Boston neck. His ox team was frozen to death, and was found standing on their feet as the snow vas deep enough to support them.

The following striking facts, we learn from the Brunswick Journal, were communicated at the last neeting of the Temperance Society in that town. Let him who has a hankering for strong drink read and tremble least he become as miserable an bject as these .- Portland Courier.

1. Within a short time a man in this town sold his own coat twice, which was each time redeemed by the labor of his virtuous, industrious wife, articles of clothing belonging to his wife, crockery from his table, -and even a blanket taken from his bed, all for rum.

2. There is a female in this town who will sell articles of provision, as grain, potatoes, or beans by the pint, quart or peck to neighbors for rum.

- 3. A man quite recently entered a store with daily sustenance.
- 4. Within a month a wife has been driven from house read the following scripture by candle light, her house on the morning of the sabbath to seek refuge from the brutality of her husband, who threatened her life. Her husband was maddened
 - fortnight suffered severe injuries in consequence of intoxication by rum. One fell under his cart wheel which horribly mangled his leg-and the

No men labor harder than printers-no men are more scantily paid in proportion to the wear and tear of mental and physical constitution-no men in this community, we are quite certain, are called upon for so large an amount, in proportion to their means, of their gratuitous services-and we believe that no men perform those unpaid services with more cheerful alacrity. The boldness or indifference with which some people lay an assessment upon newspaper proprietors would justify the inference that they supposed types and presses to cost nothing, journeymen and apprentices to labor and live without need of food or clothing, and paper-makers to furnish a costly material without plaster. ever asking for payment. We have no doubt that each of the proprietors of the daily papers in this city, gives enough annually, in the way of gratuitous rabbits. advertising for persons or societies who are able and ought to pay, in newspapers in which he gets neither credit nor thanks, to defray the expenses of educating his children, even though he might and bottom of such vessels, have a son or two in college. If some rich fellow ed Cky high, as the prince of philanthropists, and his name would ring along the Atlantic from Maine to Mexico, and be echoed by the Rocky Mountains, as a benefactor of his race. A few hundred dollars, given in a lump, is something to tell of; six- linen and other cloth. pence at a time, a dozen times a day, is never thought of .- Boston Courier.

Premiums .- At a Meeting of the Trustees of the Middlesex Agricultural Society, held in Concord, on Wednesday, the 29th ult. the following

Premiums were awarded:

six quarts of Rye from one acre and \$15.00

To Richard Hall, of Littleton, for 2144 pounds of Hops, first quality, from 148 rods, \$10.00

Recorder of the 16th inst. says, on Monday last, the sloop Cattskill sailed from the wharf of Messrs 10,000 sides of leather, worth more than \$50,000, all manufactured in that county. This they say is but a small item of the immense amount of the product of the Oak and Hemlocks of their mountains. On the same day other sloops sailed from there, freighted with the same article; and from ten to twenty loads of leather have been received daily, for many days past, in that village, each load young potatoes may be employed in dying gray, averaging in value, from five to six hundred dol- and the blossom forms a beautiful yellow. lars. So much for cultivating our own resources.

or bricks either for building or burning.

in 27, 28, and 29, and when ripe like the tomato, report. Also the 'excellent pasture.' The tender tops may be used as spinage.

IMPROVED STOCK.

Extract of a letter from a gentleman in Washington, Pa. to the Editor of the New England Farmer.

· I own a fine Bull by Denton, purchased some years ago from John Hare Power, Esq. This animal has made a great change in our stock. His calves are large, well formed, and promise to make valuable animals for the dairy. They discover a great disposition to fat, and with ordinary keep, his calves of six months old, weigh from 5 to 600 lbs. yearlings 7 to 800 lbs .- and we have heifers of 3 years old, 12 to 1300 lbs. live weight?

FOR THE NEW ENGLAND FARMER.

EXAMINATION OF FARMS.

Mr Fessenden-The Chairman of the Committee on Farms in Middlesex, in your last number, under the signature of one of the gentlemen who obtained a premium, complains that my review of the Committee's report was not a fair one. He says the reader would understand that the nine years, during which Capt. Wheeler used the manure from the large stable, were the nine years last past; whereas the report says he purchased no manure after 1818. It is true I did not name the years in which that stable manure was applied, because I did not then, nor can I now conceive it at all material. The committee had taken a full view of all the improvements made by Capt. W. for at least 20 years, and stated that he keeps now more than double the stock that was kept by the former owner. Now, sit, unless Capt. W. admits that his farm has deteriorated since 1818, I cannot see what difference can be made in the estimate, whether he used this purchased manure during the first nine years, or the last, It is true it would make a difference if the farm had been growing poorer since 1818, but Capt. W. would not admit this as a fact, and all who know his farm and his very judicious mode of farming, know that it has not latterly become poorer. Further-the report states, 'Since that time, (1819) all the manure has been made on the farm, and the soil has been considerably improved. So that the capacity of the farm for producingby the report-is even greater that at the end of the nine years. In what then consists the unfairness of the review? That review was founded entirely on the Committee's report; but it seems I committed a gross mistake in taking the report to be a true one; for we are now presented with a report entirely different from the former. Which are we to believe? It would now appear, that Mr Buckminster, far from keeping his stock on his 20 acres of land, maintains a part of it in the highway; and the remainder principally on grain, not raised on the farm! This is indeed, blowing hot and blowing cold from the same mouth. Here is 'language official and language confidential,' directly contradictory! It reminds me of the witness in Court, who, on being asked why he did not testify a second time as at first, said, ' I've altered my mind.

ered this new state of facts; he does not intimate her. - Fall-River Monitor.

31. The sediment of the fecula mixed with the that he has obtained new facts since his first re-

them to the pound ;-and that the last cattle he impounded for running at large belonged to the chairman of the committee.

Yours, very respectfully,

A SMALL FARMER.

HUDSON AND MOHAWK RAIL ROAD.

Conceiving that our readers will be gratified with a knowledge of the progress and present condition of this work, we have obtained the following information from an accurate source.

Of the excavation and embankment, more than two thirds of the whole work is finished; the whole will be completed by the 1st of April; the culverts and bridges are all finished but the bridge over Pearl Street.

The stone blocks are all delivered; these and the broken stone will be laid along the line by the Ist of April,

The timber is all contracted for, and will be on the line by the first of May; the iron rails will be ready about the same time.

Two locomotive engines have been ordered by the Company, and are expected to be on the road by the 15th of July.

The company expect to set a locomotive engine in operation by the 15th of July between Lydius Street, at Albany, and the brow of the hill, at Schenectady,

The whole work will be completed by the 15th of October.

It is intended to put the branch line, for the accommodation of the northern and central parts of Albany under contract, as soon as the legislature anthorizes the same,

The branch alluded to is designed for the convenience of passengers, and will probably enter the city at the head of Washington Street, extending down that street as far as Cruttenden's and the Parks. The importance of this work, both for purposes of general utility and as a pattern improvement must be obvious to every man. The Company deserves the highest praise for the rapidity with which they have pressed its construction since its commencement. The proposed branch will be of great convenience to passengers, and of to the legislature, at its present session, for leave to construct it; and the application will be entitled to their earliest consideration, from the circumstance, ers. that they wait only the legislative sanction to offer the contracts .- Albany Argus.

A good Cow .- Mr William Chase, of Somerset, has a cow, that during the past season has given, on an average, 20 quarts of milk per day. Nearly 14 pounds of butter per week have been made from her milk during the season. 120 lbs, were The writer does not inform us how he discovis valuable property. Mr Chase refuses to sell he entered his master's barn, and

Wool .- The last fortnight nearly all the fleec powder of charcoal, may be made into little billets port. Why, then, does the latter report differ so wool in market has been sold without any reducfar from the first? If the stock on the 'small tion from former prices. A fair demand for pulle All those uses are independent of the application farm' is not kept on the produce thereof, we are lambs, at 50 a 55c, a considerable parcel of the of the apples or fruit of the potato, the water of left to imagine what use is made of all the 'ex-discription has been sold at 53c. 3 mo. We are which when immature might probably be used as cellent hay and corn' so much extelled in the first advised of the shipment from London of a con siderable quantity for this market, which may b I have made some inquiry of the Field-driver daily expected. A letter from London, Dec. 4 of that district, who informs me that cattle are says, - Shipments of Wool have not been made not allowed to go at large in the town of Fra- to the U.S. to the extent that we anticipated; in mingham, that if he had found Mr B,'s cattle tak- fact our market until recently has been so bare ing the benefit of the act, he should have driven that many conditional orders have been from neces sity cancelled-of late the imports from Germany have been upon a liberal scale, and our market is flat in consequence, and prices for the next month may go rather lower; but we anticipate some inprovement in February, of Spanish and Portugues Wool, for which the market is very barely supplied and we do not look for any material augmentation. 3070 bales Wool were imported into London from Hamburg, week ending Nov. 30 .- Boston Cour.

New York, Jun. S .- Wook .- The importations from London mentioned in our last, have been followed this week by 276 bales from Lisbon to this port, and 38 bales from Cadiz to Philadelphia, besides one or two small parcels of Saxony to this port and Boston. The influence of these supplies, which are for the most part, still on shipboard, does not yet manifest itself. A few bales Portuguese, F. were re-sold this week, at auction, and brought 44c. cash, being about the price obtained for them a few weeks since. - Daily Adv.

EXTRAORDINARY UTILITY OF THE NETTLE.

In the weekly newspaper of the Bavarian Agrienltural Society, the nettle is said to have the following properties: I. Eaten in salad it cures consumption; 2. It fattens horned cattle whether eaten green or dried; 3. Experience has shown that it not only fattens calves but improves their breed; 4. It is an antidote to most maladies; 5. Sheep which eat it bring forth healthy vigorous lambs; 6. It promotes the laying of eggs in hens; 7. It improves the fat of pigs; 8. The seeds mixed with oats are excellent for horses; 9. It grows all the year round even in the coldest weather; 10. The fibres of the stem make an excellent hemp.

It is certain the nettle is much valued in Holland, where its young shoots are used as a pot herb; its roots for dying yellow; where the horse dealers give the seeds to horses, to make them brisk and give them a fine skin; and where consider ble portions of fields are planted with it, and mown five or six times a year as green food.

CHARCOAL DUST-A writer in the Gardener's Magazine asserts that six years' experience has convinced him that charcoal dust is a remedy for advantage to the city.-The Company will apply the grub and mouldiness in onions; and he has repeatedly proved, that it effectually prevents the clubbing in the roots of cabbages and cauliflow-

> The Newburyport Herald states, that in a large family named Poor, in West Newbury, there have been only six deaths within the last 40 years, and that four of these were of persons over 90 years of age, and the other two, of persons over 80.

Affecting Anecdote.—A heart-rending story made in 10 weeks, 108 of which were brought to is told of a young Scottish plough-boy who being this market. We understand that she has been disappointed in a love affair, was driven so near to kept upon grass, and without grain. Such a cow the verge of despair, that, with a rope in his hand, of the cows' tails together !- Pawtucket Chronicle.

Great Ox .- There is now exhibited in the village Brooklyn, N. Y. an Ox whose weight is estimated tauket, and fatted by Lemuel B. Rogers, Esq. of untington, Long Island.

Mahomet in Ohio .- We have seen a letter from nester, in Ohio, in which the career of some fanatal individuals, who pretend to work miracles and preach a new Gospel, is described; they profess have discovered somewhere in New York, a new relation, hidden under a stone, which enables them work miracles such as our Saviour did while on th; the delusion and frenzy with which these iniduals have wrought up the public mind, enabled m to collect, in two small villages, something like s hundred adherents, who follow those ignorant I deluded men, with the same submission, that eep are led to the slaughter.'-Mass. Jour.

Imprisonment for debt.—The Philadelphia Gazette Saturday contains an article which sets in a ong point of view the evils which accompany the tem of imprisonment fordebt. Between the first May last past, and the 24th Sept. forty persons e imprisoned in that city for debt, which amountaltogether to twentythree dollars and fortyseven ts. The cost on this sum amounted to \$70 05.

o Correspondents .- A very valuable and elaboarticle on raising Live Fences, by Dr Shurtleff, appear next week-also an interesting account of TIDD's extensive experiments in raising Seedling itoes and Grapes.

e advices published last Monday, from Liverpool to th December, had an immediate effect on the Flour Grain Market; upwards of 15,000 barrels were at up for the English market, at an advance of full ats per barrel, which improvement has been susthrough the week. The Wheat market has also a ved; and there are extensive orders for foreign its, but our supplies are so trifling that they cannot ed. The Provision market has kept up, and Flax-ced ill further improved. A good deal has been doing ton at former rates. Ashes are without a change. s and Molasses are the only articles that have not benefited by the late advices .- N. Y. Daily Adver-Jan. 8.

Wants a Situation.

A ardener who can produce unquestionable recom-ations for honesty, sobriety, and good moral characand who is perfectly acquainted with every branch dening, and cultivation of Grapes, wishes a perma-ituation in that capacity. He is a single man. In-of J. B. Russell, New England Farmer office.

Ammunition 3

the best quality and lowest prices, for sporting—only for sale at COPELAND'S POWDER STORE, and Street. MB. If the quality is not found satisfactory, it may the moth has been destroyed, by

Stock Wanted,

A pair of young cattle of the Improved Short Horned 4000 pounds. He was raised by Judge Strong, of breed-they must be of pure blood, the Bull not less than two years old next spring, with a dark color, (not altogether black)-the Heiler might be of any age under two years. The above cattle are to be sent to Washington, Pa.

ALSO, a young first rate Improved Durham Short Horned Cow, with calf by some of the best bulls near Boston, to go to Portsmouth, N. 11.

ALSO, a prime Cow, not over six years old, of some of the best breeds for milk, that will come in, in the course of the ensuing spring-for a farm in the vicinity of Boston

ALSO, a prime cow of one of the best breeds for milk, near Boston, about 4 years old, and with calf by some of the bulls of the best stock for milk, to go to Providence. Address J. B. Russell, Agricultural Warehouse, Boston, (post paid) with a particular description of the animals, pedigree, age, weight, &c.

For sale, a fine MERINO RAM, imported last spring from St Andero. He may be seen in this city. Apply to J. B. Russell, office of the New England Farmer.

Durham Short Horns.

For sale, several of the pure breed, descendants of the celebrated animals presented by Admiral Sir Isaac COFFIN, to the Massachusetts Society for the Promotion of Agriculture. The pedigree of these animals can be given as far back as Hubback, who was calved in 1777, and is reputed the foundation of this much admired stock. Also, several Heifers bred from the same, of various grades, from half up to seven eighths blooded animals. For particulars, inquire of E. Hersey Derby, Salem. Salem, October, 1830,

Mason's Pocket Farrier,

Comprising a general description of that noble and useful animal the Horse; fifth edition, with additions. To which is added a Prize Essay on Mules. By S. W. Pomeroy, Esq. of Brighton, Mass And an appendix, containing observations and recipes for the cure of most of the common distempers incident to Horses, Oxen, Cows, Calves, Sheep, Lambs, Swine, Dogs, &c, selected from different authors. And an Addenda, containing the annals of the Turi, American Stud Book, mode of training, rules of Racing, &c.

Just published and for sale by R. P. & C. Williams, 18 I and 20 Cornhill.

Also, on liberal terms, a large assortment of Agricultural, Historical, Theological. Law, and other Books. Persons selecting Libraries, will find it for their advantage to call. tit Dec. 31.

Treatise on Bees.

Just received and for sale at the Seed Store connected with the New England Farmer, 52 North Market-street, A further supply of a Practical Treatise on the Management of Bees; and the Establishment of Apiaries, with the best method of destroying and preventing the depredations of the Bee Moth. Brighton Market-Monday, Jan. 10. [Reported for the Chronicle and Patriot.]

At Market this day, 431 Cattle, (24 of which have been before reported, and 26 were stores,) 610 Sheep, and and 67 Swine, (58 before reported.)

Prices .- A small advance on middling Cattle. No material variation in other qualities,

Beef Cattle-From 3,50 to 4,50; a few were taken for 4.75, a 5.

Barrelling Cattle-Mess, 3,50, a 3,58, No. 1, 3 a 3 08. Sheep-We noticed a few prime wethers taken at 4,25. Also a lot, part wethers, at 3,25, and 3; also a lot of 70

Swine-Few sales only; price not noticed.

WHEAT .- The New York Journal of Commerce of Dec. 31, says, that wheat is very much wanted for exportation to England; and that the dry southern article is well calculated to mix with the English in grinding, especially as the latter is this year very ordinary.

MISCELLANY.

We seldom see better poetry than the following lines on Childhood, contained in Mrs Anna Maria Wells' collection of poems .- Mass. Jour.

CHILDHOOD.

Grav morning o'er the mountain peers; To heaven the stars are gliding back, Ere yet the 'prying eye of day ' Shall mark their noiseless track .-There's not a sound in doors or out: The very birds are yet asleep; The field flowers open silently; The breeze just whispers and goes by; And mountain-buds, that steep Their perfume in the dews of night, Lie coldly in the lingering light.

A shout!—The spell is broken up— The cottage echoes with the sound-The voice of glad surprise and mirth,-'T is heard by all around :-The frolic voice of childhood free! My own delighted, laughing boy! Just waking with the new-born day, The voice of rapture must have way, His heart is full with joy; And on his lone couch as he lies, He sings to tell his eestasies!

He sings aloud-a medley mass Of nursery rhyme, and infant lore,-No matter what the glorious theme, He sings it o'er and o'er :-He recks not, he, of such as may These clamorous sounds annoy, Who, half awakened, catch the strain And, murmuring, turn to rest again :-He thinks of nought but joy :-Of grief and pain, his heart is free, Aud earth and sky are fair to see!

Who would not be a little child, Ere yet the shade of earthly care Hath fallen upon his happy heart, And chased the sunshine there? With wisdom's light, with fancy's fire, Hereafter let thy bosom glow; But hely childhood's blessed smile, Oh, let it linger yet a while Upon thy cherub brow! Shout on, my boy! yet undefiled, Pour out thy happy heart, my child!

SPEED THE PLOUGH.

Speed the plough! O, speed the plough! The sun is up, the time is now, Drive on my hoys, God speed the plough. Now the green blade, peeping low From the fast dissolving snow, Tells the gladdened farmer bow Heaven's aid can speed the plough. Harvest home! O, hear the sound, And each jocund tale go round; The proudest lord might envy now The merry man who guides the plough. The merchant's gold, the miser's hoard, The sailor's helm, the soldier's sword, The fop's affected air, must bow To the rattling loom and gliding plough.

Amusing .- The New York Commercial relates the following droll incident which occurred at the Albany theatre on the evening of the Sth, while the battle of New Orleans 'was being' performed: ham, got up on the cotton bags and made a con- paper fainted by the way side, others gave up the siderable flourish, calling upon a by-stander to see how he would hit the white plane; but his rifle have gone by the boards. flushed in the pan, and he was obliged to ask a gentleman on the other side, who must have been one of the enemy, of course, to accommodate him with a fresh priming!' On account of this flush in the pan, we suppose, the situation of Gen. Packenhant for a few minutes may be more easily imagined than described.'

WINTER.

Winter has come in its cold and harsh reality; excitement and domestic happiness. Winter has its privations and its pains, but it has also its blessings and its pleasures; and we ought to acknowledge the one, while we feel,-but not complain of-the other.

Winter is the season for mental improvement, the culture of our immortal faculties in the pursuit by revenge, of useful knowledge, cannot be innocently neglected. Books selected with discrimination, and read, not for the sake of momentary appreciment, or of future display, but for solid advantage, should be the companions alike of the parent and the child in this season, when nature is a less eloquent or a less accessible teacher than through the rich promise of the spring and the abundant generosity of the autumn.

Winter is the season for self discipline-for the exercise of moral foresight and courage; the season to ' watch and pray, lest we fall into temptation.' Enticements to evil are multiplied; in the well thronged city lares are east in the way of the inexperienced, and facilities are provided for the indulgence of corrupt propensities. Against all the swine. The fields are divided by permanent stone wall dangers, to which his soul is exposed, the Chris- and consist of one of 40 acres in front of the house, on dangers, to which his soul is exposed, the Christian should guard himself by vigilance and irraness,
part on the East, one of 10 acres on the North, (principally orchard,) one of 15 Northeast, and one of 30 acre
maintaining a jealous regard to his own purity. We to fithe house, with three pastures of 20 to 25 acre and a wary intercourse with the things of the each world.

Winter is the senson for benevolence. The poor we have always among us, and they must receive and a half miles from the village of Dover, which afford symmathy and relief from those to whom the com- a good market. There has been planted some hundred mon Father has entrusted the means of benefit, of Fruit Trees, principally Apple, many of which an cence. - Christian Register.

PARENTAL PROMISES .-- If a parent make a promise to a child, it should be strictly performed, however trivial; and a child should never be told a falsehood, even in the most trifling matter -unless the object be to teach the child equivocation and falsehood, and train him up for the penitentiary or the gallows.

Ingenious Anagram. - The following anagram on the well known biographer, William Oldys, may claim a place among the first productions of this class. It was by Oldys himself, and was found by his executors in one of his MSS.

In word and WILL I AM a friend to you. And one friend OLD 1s worth an hundred new.

In one week, recently, more than 3000 dead hogs are said to have been freighted from Pough-keepsie, N. Y. many of them large and very fat. Montreal, L. C. -A. Bownar, Bookseller.

The recent mortality among newspapers, maga zines and reviews has been great and alarming -The Washington N. C. Times, after 8 months publication, has been discontinued, because man - The rifleman who was to shoot Gen. Packen- people subscribed, not to pay but to encourage. Thi ghost after a longer pilgrimage, and the remainde

> The manufacture of Navarino Hats, or paper Leghorns has become a considerable business in Boston,-One manufacturer informs us he made 60,000, the past year. The impressions are made on the paper by copperplate, and passed through the presses without ink. The Hat is an elegan and convenient article, and ought not to be neg lected, because it costs little. - Boston Pall.

. Irtificial Wants are more numerous and lead the season of desolation and suffering, of social to more expense than natural wants; for this cause the rich are often in greater want of money than those who have but a bare competence.

Insults and Injuries .- Injuries are much more easily atoned for and forgiven than insults. The latter degrade the mind in its own esteem, and too The opportunities which Providence affords for frequently induce it to attempt to recover its leve

For Sale,

The well known FARM in Dover, occupied for the las tourteen years by the subscriber, containing about 20 acres, well located in a square, bounded on the south by Corhecho river, and on the east by Fresh creek, on which . dide mill, with an apparatus for pounding and grindin ster. The Buildings consist of a large two story Bric me, of 46 feet by 38, with a wing of 20 by 16, all we' fing bed, adjoined to which is a shed 34 feet by 14, con rang the eider house 27 by 37, two stories, with on tered room, where all the spinning and weaving i for the family; two Barns, one of which is 100 fee 42, with two wings of about 40 feet each, one employ a stable, the other for a sheepfold, with a good yar walled in; the other is a Store Barn of 45 feet square of 1) feet post, and will contain 60 tons of bay; a pig gery of 50 feet by 30, with a cellar of 18 feet square ut der it, with boilers set to make soap, brew, and cook fc

The Farm has been gradually improving for the lasten years, and the two last has cut each year one hun | dred tons of hay, and 20 to 25 tons of thatch. It is on grafted-with Pears, Cherry, Plum, Peach and Quine bees, and many in bearing, with a small nursery.

The terms of sale may be known by applying to Majo

ANDREW PIERCE, of Dover, Mr SAMUEL LORD, 0 Portsmouth, or the subscriber on the premises

SHOLEVELLAROOP

LIVE FENCES.

MR FESSENDEN-If you think the following direcons for setting and training a hedge, which were written or the use of my son, will be serviceable to our New ngland Farmers, you are at liberty to publish them. hey were written in haste, while I was quite sick, and onfined to my chamber; there is considerable tautology, id the language inclegant, but I believe easy to be derstood. BENJAMIN SHURTLEFF.

Boston, Jan. 10th, 1831

Y EASY WAY TO MAKE A COMPLETE HEDGE OF LIVE FENCE IT A SHORT TIME.

oney Locust, (Gleditschia triacanthos,) the Red of thirty degrees. edar, (Juniperus Virginiana) &c. But I much 7. Mode of planting .- Your land and plants dled by mice during the last year.

dge should be set out in the spring, before the nts begin to vegetate, and every fibre of the roots suld be taken up with them and by no means he . Df.

3. Age of the plants .- The more age the nts have the better; as they are more hardy, e better roots, and are more likely to do well. u will rear your hedge in half the time, if you to those that are four years old and unwards. t n you will if you use seedlings. Loudon says, hree years old is certainly the youngest that uld be planted, and if they are even six or seven rs old, so much the better.' Blaikie says, 'the of the quickset plants (whether of one or two rs' growth) is not so material, as that the plants uld be of free growth.' I set one hedge in 6, with two years old plants, and another in 8, with seedlings, and they have done very well, sidering my inexperience and the awkwardness unwillingness of my men to do anything that ir fathers and grandfathers had not previously

. Assort the plants .- Let your plants be ased; the large, the small, and the different s of intermediates, each by themselves. Set large on the high, poor and gravelly land, and small on the rich land, and in the valleys and coms, and those of intermediate size on the innediate kind of land. In this way, your hedge grow nearly alike and be very even; but if intermingle promiscuously large and small, the e will grow rapidly and will keep the small n, and your hedge will be uneven and full of

so as to leave an inch of the green bark or top them down to the height you mean to keep your with four buds or eyes,

5. Spare plants,-Select a tenth or more of your best plants, and set in your Nursery in wide rows, and at a distance from each other in the rows, so that the side branches shall not interfere, that you may fill vacancies in your hedge, should any occur. Manure and hoe them, so as to keep them well ahead of your hedge, so that when set in a gap, they will not be behind their neighbors.

6. Preparation of the soil.—Let your land be well prepared, a strip at least eight feet wide, deep ploughed, well harrowed, raked over, and cleared of all sward, sods, grass, and weeds; let it be as well prepared as if you were to sow gar-1. Material for a hidge. The plants commonly den seeds. If any part of the land is poor, harrow ed for a hedge are the English White Thorn and rake in old and well rotted manure that will alagus oxycantha,) the Purging Buckthorn (Rham- | not ferment; then plough or dig a trench through is catharticus,) the Newcastle Thorn, (Crata- the middle, 8 or 10 inches deep, one side perpens crus Galli,) the Three Thorned Acacia or dicular, and the other with a gentle slope or angle

efer the American, Virginian, or Washing | thus prepared, lay your plants on the inclined plane a Thorn, (Cratagus cordata.) It seems to have or slove, in a straight line nine inches apart (more enemy. In more than half a mile of hedge, I or less,) and as deep as they originally were in I not find a dozen caterpillars' nests, or one plant the Nursery, making allowance for the dry dirt, that nay be blown or washed away; set them so 2. Season to set a hedge. In our climate a deep that all the yellow part may be completely covered; then with a hoe carefully draw on the mellov earth to cover the roots, and press and pat it does well around them. They had better be natile deeper than a little shallower, than when in the Nursery, and they will bear it, as in the Nursers they were perpendicular, but in the trench sloping. It will be best not to fill the trench completely, but to leave it a little concave about the roots that the moisture may be retained, and that you may be able to draw a few inches of pulverized earth every year around the roots, to make them throw out new shoots, and this without raising the surface so much, or making it so convex as to lose the moisture. By laying or sloping your plants, small roots strike down from the old tap roots, and you have a great number of new roots that nourish the plants and keep them firm, and prevent them from writhing about. By cutting off the top of the plant, you will have three or four strong upright young shoots, starting from the surface of the ground, instead of a solitary

> 8. Hoeing and Clearing.-Let your hedge be perfectly hoed and kept entirely free from grass and weeds. Care must be taken that the roots, girdled by mice.

9. Pruning, &c .- Prune either early in the spring, about midsummer, or late in the fall, when there is no flowing of the sap. When you planted your hedge, you preserved every root, but you f you plant the large in the rich hollows, and cut off the top, leaving but four buds, these will small on the poor knolls, one part of your produce you four large stems as supports. This ge will be years ahead of the others. Either is all the pruning or trimming the stems or up shaded the plants. ire or after planting, cut off the tops of the right shoots must have, on any condition, till they

hedge, but the side branches should be gently trimmed every year, leaving those longest near the ground, so as to have them broad at the bottom and tapering gradually towards the tops in the form of a cone, pyramid, a young fir or pitch

This trimming of the side branches makes them send out more new thoots from these extremities, which by frequent tringnings will become so thick as to fill up every erevice from top to bottom in your hedge; while the upright shoots, by not being trimmed, will accerd with strength, and support the hedge. 10. Pruning In. tranens, Trimming is usu-

ally performed with a hedge bill or shears; but a knife with a short and slightly curved blade, thick in the middle, and tapering to a thin and very sharp edge on each side, is preferable to trim off the side branches between the plans. For trimming the sides and cropping the top of the hedge. I have used a scythe. I cut off the 'seel, and punch two holes in the same end, and make a mortise in the end of a straight pole or snaith, and bore two holes through the mortise, and rivet the scythe to the pole and in the same direction with the pole, and not at right angles as for mowing-I put two nibs on the pole. With this you can cut the sides up or the tops off very quick and neat. In all your enttings, ent up if you wish to benefit your hedge, cut down if you wish to ruin

II. Miscellaneous observations .- Slope the tops of your plants to the North, they will not be so liable to be broken down by snow; or to have their buds injured in the spring, by alternately freezing and thawing-land that has been in culture is preferable to new or sward land.

Two or three rows of white beans or flat turnips, may be sowed on each side of your hedge, but potatoes would shade too much, and onions would poison the plants. Cattle, sheep, &c, must not trample or browse on them.

Forest or fruit trees, (except walnut and cedar) may be set in a hedge forty or fifty feet asunder, they make a beautiful appearance, but trim them up ever so high, they damage the hedge, if not by their shade, they will by their roots. If you do not trim a hedge any, it will be strong and thick at the bottom, giving you beautiful white blossoms and red berries

12. Errors and Mistakes .- In my first hedge my land was tough sward, and not well prepared stems, and side branches are not abraded or and I set my large plants that were two years old, wounded by the hoe. A little fresh earth ought perpendicular; in my second hedge, set out two to be drawn about the roots at each hoeing, and years after, my land was well prepared, and I set in the autumn all the leaves should be raked my yearling plants sloping, and it is ahead of the away, to prevent the stems and roots from being first hedge: had the treatment of both been equal, the first would have been three years ahead of the last. I did not hoe as often as I ought to have done, nor did I clear away the leaves in autumn so well as I should have done. I lost one year's growth of my hedge by planting two rows of potatoes on each side of it, the tops of which grew so luxuriantly, that they completely covered and

My grand error was in cropping the tops, once its, about an inch from the root or yellow part, are five or six feet in height; then you may trim and generally twice a year, with the expectation became wide, bushy and top heavy, and the hottom open, weak, and destitute of branches. Those I did not erop had large firm stems, and threw out large strong suckers from their roots, and have made a hedge imponetrable to an enraged horned bull. I ought not w have trimmed the it was six feet bigh.

18. Recapitulation .- Prepare your land in the best manner; use suitable dants of thrifty growth, the older the better; asset and accommodate to the different kinds of oil; preserve all the roots, but crop the tops, loving only four buds; keep a few in your nusery; set them sloping to the north, and leave me ground a little concave about the roots; keer them clear of grass and weeds, and add a lime earth to the roots at each hoeing; nature all they are six feet high, then crop off heage. It will look like a wedge with the sharp end upwards, and will exhibit a most beautiful appearance.

In eight years my second hedge was a sufficient fence for, or against sheep and cows. By following the above directions, a better hedge can be raised in half the time, and at an expense of less than fifty cents a rod.

SEEDLING POTATOES AND GRAPES.

Mr Fessenden-I presume by this time some of our horticultural friends are expecting to hear the result of my third year's crop of seedling potatoes, considering the importance of the article to the farmer, and in fact to all classes of our fellow citizens. It is a grand desideratum to obtain not only a good potato for the table, but one that shall give a good yield of a fair equal size. To the farmer the crop is perhaps second only to bread. It is with him a staple article, and a standing dish. It forms a part of his morning, noon, and evening repast the year round, and is no mean item to the table of the most opulent.

This is a very extensive experiment; by far the largest of any on record, at least so far as my reading extends, and has been a source of much trouble, time and expense. It is no small thing to crop and keep separate, 1500 varieties for three years. I have been almost on the point of abandoning them more than once. The extent of the experiment had well nigh defeated its end. The potatoes were planted this year about the middle of April in rows; the most of the land was very poor, the year before it was overrun with white birch; it was pretty well manured, the manure spread equal to a good shovel full to a hill; a considerable proportion of the manure, however, was composed of meadow mud. The land was overseeded, owing to my anxiety to give every variety a trial; and a considerable proportion of the potatoes was under size, which probably gave me a larger crop and a greater proportion of small potatoes than I should otherwise have had. They were above the middling size, and very equal in size, so planted on about 4 acres of land and yielded me much so that they would not require any picking

more perfect throughout, but it had a contrary ef-condemned to the hogs. There were long reeds first in every other respect. The first was named fect, by throwing out a great number of small planted in three different places for a guide in de- the Roxbury Reds, the other the Roxbury Oranges shoots at the place cut; instead of increasing the ermining their relative yield. For I was deter their yield was about 5 hoe handles to the bushelf main stem and lower branches, and thickening the mined, having screwed my courage to the sticking. They were not so mealy nor of so good flavor a bottom as was expected. The oftener I cropped, place, that I would reject all those that would not many others of less yield, but their yield and siz the more weak shoots came out where cut, and bear a good comparison in point of yield; and in must, I think, make them a valuable potato to the those below dwindled and perished, and the main reference to my memorandum, I find that I have farmer. The vines of my largest kinds died stem ecased to increase. The top of the hedge not saved more than three or four kinds, that yield-down to the ground in the fore part of July, but ed less. The way in which we determined the were left in the ground until the rest were dug, when relative yield, was by measuring the ground with to my astonishment, I found that they had not only the hoe handle, which was quickly and easily done, sprouted, but the vines had grown nearly a foot i and was sufficiently accurate for our purpose, and height, and on digging them I found new potatoes the potatoes in a measure. The hoc handle was set for the second crop, about four feet in length. We carried into the main stems after the first or second trimming, till field with us boxes, bags, kegs, &c, sufficient to I could conveniently and make it intelligible; and hold all that we could dig in half a day. At noon Tope it will answer the expectations of our friends and at night they were put in piles on the cellar and that the experiment will prove, in proportion floor, the vessel in which they were put was marked to its extent, and the time and labor spent on it with the number of line handles to the bushel and beneficial to our community. So far as regard the pile in the cellar with a corresponding number. 11yself, I have no expectation of being remunerated We provided a circular board, a little smaller than for I am essentially deficient in an important re the bottom of a boiler we have set in brick work. and in this board we inserted 30 or 40 wires about viz. that of making the most of it in the mar 12 inches long. The wires were placed circular ket. in the hoard, gradually progressing towards the cenclear away the leaves at autumn; trim the side tre, so as to form a spiral line from the outside to branches carefully, and leave the main stems to the centre. Now if each pile of potatoes in the cellar was numbered and we commenced on the the teps to the height you mean to have your outside wire of our board and proceded regularly, we could easily tell from which pile each of the potatoes on the board came, and in this way we could try at night all the varieties we could lig in the day time. After the potatoes were boiled on this board in the boiler aforesaid, we carried the poard with the potatoes on it down cellar and compared them to prevent mistakes. In making up our judgment, regard was had to the appearance of the potatoes as well as their yield and flavor-their form, mealiness,&c, were all taken into the account. I have given them my personal attention both in planting, digging, and proving, except when called away by urgent business.

In this way I have preserved 186 sorts of my 1500 varieties and about 72 bushels in quantity.-The long reds yielded about 12 hoe handles to the bushel. The greatest yield of my seedlings was 4 hoe handles to the bushel, three times as much on the same land .- The kind that yielded the most last year did not do so well this year; they were a late kind, and required a long season and a favorable situation to come to maturity. Perhars an abstract from my memorandum might be interesting, as showing the relative yield, for we found it utterly impossible to decide with any justice upon the flavor, for after we had tasted of a few, especially if we happened to try a strong one, we could no longer decide upon the merits; we therefore contented ourselves with tasting only those which by their mealiness, appearance, &c, gave the most promise, saving all the good yielders that eracked open in boiling. I have a considerable number, however, marked on my memorandum as of superior good flavor. I have one kind which gave a bushel in 4 hoc handles; 2 kinds, 43 do; 4 kinds, 5 do; 2 kinds, 51 do; 9 kinds, 6 do; 3 kinds, 64 do; 16 kinds, 7 do; 41 kinds, 8 do; 29 kinds, 9 do; 23 kinds, 10 do; &c.

There are two kinds which particularly attracted my attention while digging, and were named on the spot. One was round, red, rather

of making the hedge thicker at the bottom, and by estimation 1000 bushels, 900 of which were for the market; the other was yellow and like the

I have now given you as concise an account as misite to an enterprising and flourishing farme

I have also under way and under glass, abou 200 seedling grape vines of two years' growth raised from the seed of the large oval Malag grape, which appear very promising, but I sha not probably, if I should live, taste the fruit unt year after next, when I hope to be able to preser a sample which shall be thought worthy of receiving a name from our Horticultural Society. JACOB TIDD. Roxbury, Jan. 10, 1831.

SALT HAY.

MR EDITOR-I wish to inquire through the medium of the New England Farmer, the efficac and benefit of using salt hay, as it is called .- Ther are many farmers on our sea coast that spend ha the summer with a strong gang of workmen, i mowing the salt mashes; and in curing and makir the hay-exposed to the wet and cold, and bot night and day watching the tides in order to bo. and secure what appears to my inexperience mind a useless commodity.-It also appears t me that half their labor, if exercised upon the up land or on their farms, in raising good English ha would bring them a handsome recompense, no only in the possession of good food for their stoc. but also serve to better their land, and inducthem to bring more waste and low ground into state of cultivation.- I should be happy to receiv through your paper, some information on the subject, which perhaps may serve to correct the error of the farmers who thus waste their time and labor; or serve to correct me in thus wastin my time and sense on a subject of which I avo myself ignorant, or which may have been settle long ago by wiser heads than mine.

Duxbury, Jan. 4th.

FLOWING FRESH MEADOWS.

Mr Editor-I believe there never has bee any communication in the New England Farme in regard to flooding fresh meadow lands-if you or some of your correspondents will give som information respecting flooding fresh meadown where Fowl Meadow, Blue Joint, and the commo Flat Grass, and other kinds of uncultivated grass. incline to grow-and such other information : you may think necessary, it would confer a fave upon one of your subscribers.

I am &c, Winthrop, (Me.) January 14th, 1831.

J. B.

COOK'S ADDRESS. Concluded from page :03.

We have been too long accustomed to rely upon foreign nurseries for fruit trees and other plants. I am aware that to a certain extent this is unavoidable. But we should depend more upon our own resources, and learn to appreciate them. We have suffered too much of disappointment, and experienced too much of vexation from the carelesness of others to submit with patience to a repetition of them. We have waited season after season for several successive years for the development of fruits that were sent to us under the imposing title of some rich and rare variety, and have found in the reality that the good consisted alone in the name. I would encourage the public nurscries in our own vicinity, not to gratify any exclusive or sectional views, but because we may thereby the more easily avoid the inconveniences which have long been the subject of complaint against others more remote. The fear of prompt and immediate detection and exposure, will have a tendency to render their proprietors more cautious, while the liberal support they would receive, would stimulate them to secure and retain the confidence reposed in them. The imposition that was practised upon the patriarch Jacob, who was compelled to accept Leah as the reward of seven years of labor and toil, for Rachel, is somewhat analagous to the case of many of us. We, too, have numbered full seven years in anticipation of the development of iruits under assurances as specious as hose by which the patriarch was stimulated to the berformance of his supulated servitude, and, like im, on its termination, have found a Leah in the place of a Rachel, and have again, like him, to eccomplish another term of years ere we could ealize the hopes we had formed in the acquisition of the object of our desires.

The public nurseries and gardens of Middlesex and Norfolk are entitled to preeminence among hose of New England, and Newton and Brightm, and Charlestown and Milton and Roxbury, are audably competing with similar establishments in ther sections of our country for the general pat-

onage.

A familiar accquaintance with the synonymes, nd their identity with the fruit, is essential to the onvenience of all classes of cultivators and indisensable to the proprietors of extensive nurseries. t will prevent much of the confusion which now revails, and tend to correct the mistakes which requently occur to those who have not attended to his subject.

If it has been the prevailing fashion to underrate dmost everything of domestic origin, and attach a alue to exotics in proportion to the distance from and the expense at which they were procured, it vas no less true of the products of the soil, than of those of the workshop and the loom. Even the ptellectual labors of our countrymen have, until vithin a short period, been received with the cold brmality with which an indigent acquaintance is often recognised. While everything that bore he impress of a foreign original was sought after, admired and eulogised without much regard to ts intrinsic merits. But these aftinational preudices and predilections are fast receding before he beaming and unquenchable light of intelligence and patriotism.

I have spoken of the influence that our associaion has exerted in relation to the primary objects of its institution. There are other subjects con-

have adverted, and which should interest our at- and with arguments that will not fail to insure the tention. A practical acquaintance with the dif- influence of all in its execution, ferent departments of natural history will be found to be highly advantageous in the business of hor- tery, similar in its designs to that of Pere La facilities that will be afforded us, to acquire a knowledge of this subject, when it will comport with the convenience of the gentlemen who have been designated as professors and lecturers on botany and vegetable physiology, entomology and horticultural chemistry. Lauticipate from those resources not only much intellectual gratification, but that, from their abundant stores of scientific attainments, we may be instructed and encouraged to persevere in obtaining a familiar intimacy with all that is essential to our pursuits.

The protection and preservation of useful birds is a subject I would propose for your particular consideration. To those whose souls are attuned to the harmony of their music, who delight to listen to the warbling of nature's choristers, little need be urged to insure them security in the peaceful possession of their accustomed harmts. But if this consideration is not sufficient, there is another view in which the subject may be presented, that cannot fail to render them the objects of our care and watchfulness. We must either encourage them, or resign our gardens and orchards to the overwhelming ravages of innumerable insatiate insects. We must preserve them, and consent to tolerate their minor depredations, or suffer them to be destroyed, and with them all hopes of preserving any portion of our fruits.

It is asserted upon competent authority, that nearly all the food of small birds from the commeacement of spring to the middle of June, consists of insects; and that a pair of sparrows during the time they have their young ones to provide for, destroy every week about three thousand three hundred caterpillars. By a wise and indicious enactment of the legislature of Massachusetts, the protection of law is extended to the preservation of certain kinds of birds that are enumerated, and a penalty provided for every infraction of its provisions. Let this association unite in giving efficiency to the laws, by enforcing its operations upon every violator, and thus shall we subserve the public interests, protect our property, and preserve those innocent and useful colaborers, who amply repay us in the aid they afford, and in the gratification we derive from their presence, and in listening to their inspiring and animating melody.

The pursuits which it is our object to promote, are not only subservient to the happiness of social and domestic life, in multiplying the resources of innocent indulgence, and of the interchange of the kind offices of mutual good will, and not only tend to excite and elevate that taste for the beauties of creation, which almost of necessity leads to communion with its All-Glorious Author, but may be consecrated also to the holy purpose of rendering more interesting and attractive our final resting-place.

The improvement and embellishment of grounds devoted to public uses, is deserving of especial consideration, and should interest the ingenious, the All boys wage war against them now. liberal and tasteful in devising 'ways and means' for the accomplishment of so desirable an object; and I deem this a suitable occasion to direct the attention of our citizens to a subject I have long wished to see presented to their consideration, sected with its success and usefulness, to which I with an eloquence that could not fail to awaken,

I refer to the establishment of a public cometiculture. I hope we may avail ourselves of the Chaise in the environs of Paris, to be located in the suburbs of this metropolis. A suitable regard for the memory of the dead is not inconsistent with the precepts of religion or of our duty to the living. The place of graves affords to the serious and the contemplative, instruction and admonition. It teaches us 'what shadows we are, and what shadows we pursue.' It is there that the heart is chastened, and the soul is subdued, and the affections purified and exalted. It is there that ambition surveys the boundaries of its powers, of its hopes, and its aspirations. And it is there that we are constrained to admit, that human distinctions, and arrogance, and influence must terminato I would render such scenes more alluring, more familar and imposing, by the aid of rural embellishments. The skill and taste of the architect should be exerted in the construction of the requisite departments and avenues; and appropriate trees and plants should decorate its borders; - the weeping willow, waving its graceful drapery over the monumental marble, and the sombre foliage of the cypress should shade it, and the tudying daisy should mingle its bright and glowing tints with the native laurels of our forests. It is there I would desire to see the taste of the florist manifested in the collection and arrangement of beautiful and fragrant flowers, that in their budding and bloom and decay they should be the silent but expressive teachers of morality, and remind us that, although, like the flowers of autumn, the race of man is fading from off the earth, yet like them his root will not perish in the ground, but will rise again in a renewed existence, to shed the sweet influence of a useful life, in gardens of unfading

> Sole Leather .- We hear that Massachusetts Sole Leather is in high estimation.-The Philadelphia Leather is in high repute; but we understand that many now give the preference to that manufactured by Mr Tufts of Charlestown.-Palladium.

> [The generality of sole leather manufactured in this state, is believed to be very bad, because it is not sufficiently tanned. We have been informed that some tanners turn their stock every three months. We should like to see the opinion of an experienced physician as to the effect of loose, porous and untan-ned sole leather in producing colds, coughs and consumptions in this city. - Mass. Jour.

> Palm Leaf Hats,-This manufacture has become in Massachusetts, a business of importance. A friend calculates that a million of these will be made for the next season. Formerly they were imported from Cuba, and sold we believe, for about two dollars each. Now the raw materials is imported, and the hats made here, which sell for three or four dollars per

> New Bonnets .- In the State of New York very beautiful bonnets have been made of hornets' nest. The quality that makes this substance particularly valuable, is that the hornet uses a kind of sizing which resists the rain, like Roman cement. The nest is colored to suit the fancy. Dr Mitchell of New York, suggests the protection and culture of hornets.

> Bohon Upas .-- An article reviving the old story about this tree, is making the tour of the press.-The Philadelphia U. S. Gazette informs that a physician of that city has actually visited the tree, the gum of which is a strong poison, but not by any means so destructive as has been represented,

COMMUNICATIONS.

T. G. FESSENDEN, Esq.

DEAR SIR-As there has existed more confusion and inaccuracy in regard to the nomenclature and identity of the Epargne, Jurgonelle, and Windsor or Cuisse Madame pears than any others, I submit the following extracts from the ' Pomological Manual' now publishing, in reference thereto, and Pomological Magazine. hope they may prove satisfactory to our Pomologists

The translation of the new edition of Duhamel has been completed and nearly the whole is now printed off, so that the work will be very speedily presented to the public.

Very respectfully, WM. PRINCE.

Paire des tables des Princes, Real Jurgonelle. Fes. New. Amer. Gard.

This pear, which is extensively cultivated in this vicinity and in various sections of the union, is most generally known by the titles of Jargonelle, Cuisse aradame, and Lady's thigh, it having been received from England under the name of Jargonelle, and from France under those of Epargne, Cuisse madame, and Grosse Cuisse madame. As I can perceive no good reason why we should adopt the blunders of the English, even if they have received countenance from being copied into some of their works deemed in other cases to be authority, and as both Miller and Forsyth reject the error referred to, it is to be regretted that a publication having so many claims to superiority as the Pomological Magazine should have continued it; for although long usage may be sometimes allowed to form an apology for adopting a title erroneous in its origin, such course can only be admitted when it may be done without confusion; but in the present case there is a genuine Jurgonelle, so called by all the French authors since the middle of the 17th Century, and supposed to be one of the most ancient varieties in cultivation; and the only means of preventing confusion is to correct the error at once.

The following description is from Duhamel, an author celebrated for his great accuracy, and accords with my own observations.

'This fruit is of very oblong form, being three to three and a half inches in height, and twentytwo to twentyfour lines in diameter at its largest part, which is at about two thirds its length, measuring from the base; the eye is placed in a slight cavity, which is surrounded by several projections; the stem is two inches in length, or thereabouts, and the fruit has often some prominence or swellings at its insertion; the skin is greenish and the 17th century, and its origin is traced much somewhat marbled with fawn-color mingled with farther back by some writers. The remarks on red next to the sun; the flesh is white, and melt- that head, at page 108, of the Pomological Mag- Farmer of the 7th inst. two communications of ing with a slight acidity of flavor, which is rich azine, although applied to the preceding variety, the culture of silk; one of which is from Mo

quently abortive. This pear is one of the most there remarked, that the name of the Jargonell beautiful and one of the best that is to be met pear is derived, according to Ménage and Ducha with at the period of its maturity, which is at the from Jargon, anciently Gergon, in Italian Gergo end of July to the tenth of August. It is deemed by those who supply irregular and ill-formed in their appearance. the markets with fruit to be one of the kinds best calculated for that purpose, and such appears to be WINDSOR. PR. CAT. MIL. FOR. LANG. POM its character wherever cultivated; and from its being one of the oldest pears, it forms a sorrowful comment on the principle of exhaustion of the variety by age. In Fessenden's American Gardener, it is stated to be a great and constant bearer, and to come in between the smaller fruits of the garden such as the strawberry and raspberry, and the peach. It is also very justly remarked in that work, that the fruit generally seen in market is a caricature of that raised by the cultivator for his own use, it being in the former case gathered unripe and artificially ripened, by being spread in great masses.

It is a singular circumstance that Miller does not refer at all to the Epargne pear, although he evidently had the same fruit in view when describing his 'Cuisse madame or Lady's thigh, in England, commonly called Jargonelle; but he quotes Tourn, and Duhamel erroneously when applying their titles to his description. The whole chain of error and transposition seems to have arisen from its not being understood by Miller that the Epargne of the French was the Jargonelle of the

does not do so well on the quince. This is deemed to be a fruit of only secondar quality. It soon turns soft, and in a few day after maturity becomes mealy. Many person entitivate it for market, but of how much greate advantage would it be to themselves and the pub lic, if they would reject inferior fruits and culti vate only the choicest for that purpose, which would command a very enhanced price, and thereby amply repay them.

Forsyth describes this under two heads, the Windsor, and Cuisse Madame. The French writers state that the stem of the fruit is no strongly attached to the tree, and that in conse quence the least wind blows it off, and Coxe adopts these and other remarks, which shows he had reference to the same fruit, and indeed he appears to have generally been guided by Rozier in his descriptions of pears.

FOR THE NEW ENGLAND FARMER.

SILK.

MR FESSENDEN-I observe in the New England

presume 25 cts per lb, to be a fair price; but they | Dollars per acre. nay be more, as it will depend on the demand, which will probably exceed the production another eason. There will be, or should be, Agents in loston to purchase them.

I have attended a course of Lectures in this place, n the Silk business, by J. H. Corb, Esq. of Dedam, and think that he possesses extensive informaon on the subject. He appears to have a practiil as well as theoretical knowledge of its growth ad manufacture: and I should think that it would heneficial for the inhabitants of Concord and its cinity to employ him to deliver a course of Leeres in that place, as his charges are reasonable, ad he would no doubt impart valuable informa-

I am informed that in Connecticut, where the wing Silk business is carried on extensively, they rive a very handsome profit, as will appear by e value they attach to a Mulberry Orchard. A irm that would bring Two Thousand Dollars thout one, will as readily command Three iousand with one; and Mr D'Homerque states it converting the best silk into the aforesaid icle, is as improper as it would be to manufacture gold from the mines of North Carolina into ing pans and kettles .- His Essays are a valuaproduction and will be the means of facilitating growth and manufacture of silk in this country. together with Mr Peter Duponceyu, propose t the Raw Silkbe reeled in a proper manner I be made an article of exportation. I have no libt it might be made a profitable branch of indary, but think the course it will naturally take, Ifirst be to supply those persons already ened in its manufacture and those that will folfrom the operation of filature establishments, soon as silk is prepared in a proper manner for manufacture of goods, the artists already in country, that understand the manufacture of stuffs, will be called into action, and the manuare of the various kinds will probably keep e with the production.

Ve already manufacture silk fringe, suspenders, ons, satin straws, silk lace, silk velvets, and er articles, and find a difficulty in obtaining the per material. Whenever there shall be an rstock of the raw material for the aforesaid pures, the exportation of the article will necessafollow, but notil that time it will probably be sumed in the country.

With respect to the communication signed W. buld observe that a few filature establishments dd be the means of producing more Cocoons hout disgust or famting' than all the schools writings of a century without them. BARK PEELED FROM FRUIT TREES BY CALVES.

Mr Fessenben-Through the medium of your useful paper the success of farmers is often brought before the public. A fuilure like the following, I have thought might also be of service. A neighbor of mine has a mowing lot of 5 acreson a part of it he has an orchard of about 80 anple trees which were set out in 1824. The trees were inoculated excepting a few which were grafied, in a nursery three years before. Owing to a want of skilful management, the trees are not very thrifty. At the ground the stocks will average about 14 inches. But for an injury they received, which I am going to mention, they probably would have borne fruit in a year or two. This year, after having, there was considerable aftermath. -My friend had no stock with which he could feed it. so let it out to one of his neighbors, who put in a couple of spring calves. The lot is some distance off and was visited but seldom, and not until it was time to take calves home for winter, was the mischief they have done discovered. They have barked the trees, with few exceptions, from near the ground to the height of 3 or 4 feet. They ate the bark so far as could be known. This is a thing unheard of in this region. Did you, or any of your correspondents, ever hear or know anything like it? What is it best to do with them? ONE OF YOUR READERS.

South Reading, Jan. 14.

Remarks by the Editor .- With regard to the above subject, some writers have advised to keep orchards for pastures for calves and swine, though sheep, it is said, will sometimes grow off the bark of young apple trees; and it has been advised to give them a coating of lime or Forsyth's composition to defend the trees against their depredations, With regard to the best remedy for the injured trees, we can think of none except heading down or cutting off the stocks close to the ground, and training the fairest and most thrifty sprouts from each stump to form future trees.

new england farmer.

BOSTON, FRIDAY, JANUARY 21, 1831.

From the Transactions of the London Horticultural Society.

ON THE CULTURE OF THE POTATO.

Whatever may have been the amount of the advantages, or injury which the British Empire has sustained by the very widely extended culture ing the worms; then boys are employed to of the Potato, it is obvious that under present the leaves at a certain price per lb.; after being existing circumstances it must continue to be very thed they are handed over to females who extensively cultivated; for though it is a calamity ibute them and take the necessary care. I pre- to have a numerous population who are compelled e that a Mulberry Orchard of one acre, proper- by poverty to live chiefly on potatoes, it would anaged, would produce a nett income annually certainly be a much greater calamity to have the the farmer of Sixty Dollars, by selling his Co-same population without their having them to eat. large and productive variety of potatoes only, but

Under this view of the subject, I have been led to endeavor to ascertain by a course of experiments, the mode of culture by which the largest and most regular produce of potatoes, and of the best quality may be obtained from the least extent and value of ground, and having succeeded best by deviating rather widely from ordinary rules of culture, I send the following account of the results of my experiments. These were made upon different varieties of potatoes; but as the results were in all eases nearly the same, I think that I shall most readily cause the practice I recommend to be understood by describing minutely the treatment of a single variety only which I received from the Horticultural Society, under the name of Lankman's Potato.

The soil in which I proposed to plant being very shallow, and lying upon a rock, I collected it with a plough into high ridges of four feet wide, to give it an artificial depth. A deep furrow was made along the centre and highest part of each ridge, and in the bottom of this whole potatoes, the lightest of which did not weigh less than four ounces were deposited, at only six inches distance from the centre of one to another, Manure, in the ordinary quantity was then introduced, and mould was added, sufficient to cover the potatoes more deeply than is generally done.

The stems of the potatoes, as of other plants, rise perpendicularly, under the influence of their unerring guide, gravitation, so long as they continue to be concealed beneath the soil; but as soon as they rise above it they are to a considerable extent under the control of another agent, light. Each inclines in whatever direction it receives the greatest quantity of that fluid, and consequently each avoids and appears to shun the shade of every contiguous plant. The old tubers being large, and under the mode of culture recommended, rather deeply buried in the ground, the young plants, in the early part of summer, never suffer from want of moisture; and being abundantly nourished, they soon extend themselves in every direction till they meet those of the contiguous rows which they do not over-shadow on

The stems being abundantly fed, owing to the size of the old tubers, rise from the ground with great strength and luxuriance, support well their foliage, and a larger breadth of this is thus, I think, exposed to the light during the whole season, than under any other mode of culture which I have seen; and the plants acquire a very large size early in the summer, the tubers of even very late varieties arrive at a state of perfect muturity early in autumn.

account of the width of the intervals.

Having found my crops of potatoes to be in the last three years, during which alone I have accurately adopted the mode of culture above described. much greater than they had ever previously been, as well as of excellent quality, I was lead to ascertain the amount in weight, which an acre of ground such as I have described, the soil of which was naturally poor and shallow would produce. A colony of Rabbits had, however, in the last year done a good deal of damage, and Pheasants had caten many of the tubers which the Rabbits had exposed to view; but the remaining produce per acre exceeded five hundred and thirtynine bushels of eightytwo pounds each, two pounds being allowed in every bushel on account of a very small quantity of earth which adhered to each of them.

The preceding experiments were made with a

I am much inclined to think that I have raised, and of food, and directly opposite to something eaten, some of the interior states of India-Natural ar shall raise in the present year, 1828, nearly as large—which resembled the dung of the cow; the stomach 'Revealed Religion-Modern Novels-Inquiry in a produce per acre of a well known small early variety, the Ashleaved Kidney Potatoes. Of this variety, I selected in the present spring the largest large quantity of potato vines in the barn yard fiamentary Reform-National Library-Germe tubers which I could cause to be produced in the past year; and I have planted them nearly in contact with each other in the rows, and with intervals, on account of the shortness of their stems, of only two feet between the rows. The plants at present display an unrivalled degree of strength and vigor of growth, arising from the very large size (for that variety) of the planted tubers; and as large a breadth of foliage is exposed to light by the small as could be exposed by a large variety; and as I have always found the amount of the produce under any given external circumstances to be regulated by the extent of foliage, which was exposed to light, I think it possible that I shall obtain as large or nearly as large a crop from the small variety the present year as I obtained from the large variety in the last. I have uniformly found that to obtain erops of potatoes of great weight and excellence, the period of planting should never be later than the beginning of March, [in England.]

Postcript.

March 23, 1829 .- Somewhat contrary to my expectations, the produce of the small early potatoes exceeded very considerably that of the large one above mentioned, being per acre, 665 bushels of 82 pounds. It is usually calculated by farmers that eighty pounds of potatoes though eaten raw after they have begun to germinate, will afford two nounds of Pork; and I doubt much if the haulm and the whole of the manure, made by the hogs were restored to the ground, whether it would be in any degree impoverished. I am not satisfied that it would not be enriched, an important subject for consideration in a country of which the produce is at present unequal to the support of its ishabtants, and which produce I confidently believe and fear is growing gradually less while the number of its inhabitants is rapidly increasing.

POISON FROM WEEDS AND POTATO TOPS.

We have received a communication from Mr J. H. Gibson of Philadelphia County, from which the following facts are obtained. On the 15th of Dec. last it rained very plentifully. The next morning a favorite cow was lying down and could not get up to be milked. She appeared in some pain, grouned, and her head was doubled back on her side much in the manner of a kitten asleep, On being moved, her muscles were found very flexible, but she had not the power of moving from any position in which the strength of several men placed her. She was drenched with oil and whiskey. There was no distention. The eye looked bright except when occasionally rolled about in the paroxysms of pain. The cow had always been healthy and was so the night before. She died, and in the gasp of death discharged a large quantity of dark colored fluid from her mouth and nostrils in a broad stream. On dissection, the first stomach had in it some dark colored water mingled with the food. The second stomach was filled with the different articles eaten in a very dry state. The gall bladder was much distended, and full of a dark fluid which had discolored in a short time the adjacent viscera.

Soon after, a pig belonging to the writer was affected by similar symptoms and soon died. Ten minutes after its death the stomach was found full ogy-Travels in Africa-Annals and Antiquities of them on.

was found of a red ash color.

which is hollow in the centre, so that the water Literature-The New Parliament .- Price \$5,0 does not pass off." Potatoes belong to a poisonous per annum. class of vegetables, too many of the weeds were ripe before they were haded into the yard, and strong infusions remained in the bottom of the yard; and from various circumstances and appearances, detailed in the commication, the writer is of opinion that the cow having eaten drier food than usual, and drank of this contaminated water, 'was poisoned by the infusions of weeds of various descriptions, such as grow among highly manured crops, and of the vines and apples of the potatoes. The writer adds I have kept cows and sheep in a close barn yard for months in the winter without water, and when they were freely fed with rula baga To Gideon Foster, of Charlestown, for his cr and potatoes, they would not drink. But at the commencement of the season greater care is neces-

17.—Heifer—2 years old this month, brownish red and white, by Wye Comet, dam a native cow, 1-2 blood

18 .- A large white Cow, (Ceres) which has taken a premium at Brighton. Her dam, the Hon, Mr Gray's imported cow, for which he gave \$200; her sire Coelebs. She is very large, and has been kept on 'only orchard grass, clover grass, and slops of Indian meal,' will give 20 quarts of milk a day, and is with calf by a son of Bolivar—\$100.

Also-Grand Master, an imported Maltese Jack, full 13 1-2 hands high, 12 years old, a vigorous and sure mule getter-price \$700. (\$1000 was refused for him in 1827.)

GRAND SULTAN, a young Jack, 2 years old last August, full 12 1-2 hands high, by Grand Master out of a fine Jennet imported from Majorea by Commodore Jones -he is vigorous, brought up with a Filly, and went to her the last season-\$500.

BONAPARTE, a Jack, 3 years old, 11 1-2 hands high, vigorous, and went to one mare the past season, the only one offered him-\$150.

PLUTO, a Jack, 7 years old, 12 1-2 hands high, bred by Hon. Charles Carroll, of Carrollton, Md.-\$250.

DESDEMONA, a large and fine Jennet, 6 years old, 13 hands high, in foal by Grand Master, to toal in April-

A large and fine young Jennet, 2 years old last August, out of Desdemona, by Grand Master, and believed to be with foal by him-\$200,

9 full blood Saxon Rams, and 11 full blood Saxon Ram Lambs, from the best stock imported into this countryone of the Rams cost \$170 in 1825, and several of the others cost \$50; will be sold at from \$12 50 to \$15 each.

Also, several half blooded Calves, got by Bolivar, from our best native cows.

Also-Three Bull Calves, that will be large enough to go to cows in May next—two of them are 1-2 Bolivar, 1-d Coclebs, and 1-d of the breed that Col. Power's famous bull, Malcolm, descended from, (and for milk are considered very superior) viz. Galloway, bull is Bolivar and Fill Pail-\$10 each, delivered in Bos-

We have also for sale several first rate Dairy Cows, from several gentlemen in this vicinity, from \$10 to \$75 each; among which are a few full blooded Mitch Cows and Heifers, from the stock of Gov. LINCOLN, which are reputed the first dairy stock in New England. Particulars of their pedigree, prices, &c. can be obtained on application to J. B. Russelle, New England Farmer Office, Boston. If application is made by mail, letters must come post paid to insure attention. Pigs of the Byfield and Bedford breeds, and of Capt.

Mackay's fine prize pigs, will be ready for sale the cnsuing spring.

*Wye Comet, a thorough bred improved Durham Short Horn Bull, begutten in England by Bluze, dam White Rose, hred by Charles Champion, Esq. imported by John S. Skinner, Esq. Baltithenton, a thorough bred incroved Durham Short Hern Bull, bred by Mr Witherell, and imported by Stephen Williams, Esq.

of Northborough. timported by Gorham Parsons, Esq. of Brighton.

Brighton Market-Monday, Jan. 17. [Reported for the Chronicle and Patriot.]

At Market this day, 495 Cattle, 915 Sheep, and 440

We shall omit giving prices, the market not being near closed at the usual time of making up our report; some of the cattle have not yet arrived, being stopped by the snow drifts.

MISCELLANY.

THE ANT AND THE CRICKET: OR, THE BANKRUPT AND THE BANKER. A silly young Cricket, accustomed to sing Through the warm sunny months of gay summer and

Began to complain, when he found that at home, His cupboard was empty and winter was come.

Not a crumb to be found On the snow covered ground, Not a flower could he see, Not a leaf on a tree;

'Oh! what will become,' says the Cricket, 'of me?'

At last, by starvation and famine made bold, All dripping with wet, and all trembling with cold, Away he set off to a miserly Ant, To see if to keep him alive, he would grant

Him shelter from rain; A mouthful of grain He wished only to borrow, He'd repay it tomorrow; If not, he must die of starvation and sorrow.

Says the Ant to the Cricket, 'I'm your servant and friend, But we Ants never borrow, we Ants never lend; But tell me, dear Cricket, did you lay nothing by When the weather was warm?' Quoth the Cricket, 'Not I;

My heart was so light, That I sang day and night, For all nature looked gay,'

'You sang, sir, you say? Go then,' says the Ant, 'and dance winter away.'

Thus ending, he hastily lifted the wicket, And out of the door turned the poor little Cricket. Folks call this a fable: I'll warrant it true; Some crickets have four legs and some have but two.

NEW ENGLAND.

BY JOHN GREENLEAF WHITTIER.

Land of the forest and the rock-Of dark blue lake and mighty river-Of mountains reared aloft to mock The storm's career-the lightning's shock-

My own green land forever! Land of the beautiful and brave-The freeman's home—the martyr's grave— The nursery of giant men, Whose deeds have linked with every glen, And every hill, and every stream, The remance of some warrior dream! Oh, never may a son of thine, Where'er his wandering steps incline, Forget the sky which bent above His childhood like a dream of love.

From the Wilkesbarre Gleaner.

Pray take my advice, if a fortune you'd get, Pay off what you owe and then keep out of debt.

This may be had poetry, but depend upon it, is excellent sense. It is an old saying that 'the debtor is a slave to the creditor.' If so half the world enter into voluntary servitude. The universal rage to buy on credit, is a serious evil to this country. Many a valuable man is ruined by it.

There was Titus Thornbury, who was an industrious man. He had as good a farm as lay in the north parish of Applebury. But unfortunately he gave way to the prevailing fashion of getting in debt, and a sad life he led of it .- At 30, he owed creditor the balance, with 7 per cent interest.

2001. His farm yielded about that sum. He would not live without purchasing some things, and as all the money he could raise went to pay principal and interest on his debt, he had everything to buy on credit. So at the year's end, with interest and cost, and loss of time, and extra prices charged for things, because he did not make ready pay, he was just as deeply involved as the year before. Thus harassed, dunned and termented, was poor Thornbury, for 20 years.

Not so was it with his cousin, Ned Forest. He vowed he'd owe no man. The produce of his farm was about the same as that of Thornbury's; but as he was not forced by duns, or executions to sell it out of season, he got the highest price: as he paid for things when he bought them, he got his necessaries 2 per cent cheaper: As he paid neither interest nor cost, and lost no time in running to borrow money or to see his creditors, he laid up 90l. a year, lived quite as well as his cousin, and infinitely happier.

When poor Thornbury saw a man riding up the road, his anxious look told him as plain as look could tell 'plague on that fellow, he is come to dun me,' When a sudden rap at the door announced a visitor, no matter how lately he had been, he turned pale, and looked sorrowfully anxious, until the visitor was known,

Many a man goes into the store for a single article. Looking round, twenty things strike his fancy; he has no money, but buys on credit. Foolish man! Pay day must come and ten chances to one, like death, it finds you unprepared to meet it. Tell me, ye who have experienced it, did the pleasure of possessing the articles, bear any proportion to the pain of being called on to pay for them, when you had it not in your power?

Good people, bark ye: A few rules well kept, will contribute much to your happiness and independence. Never buy what you do not really want. Never purchase on credit what you can possibly do without. Take pride in being able to say, I own NO MAN. Wives are sometimes thoughtless, daughters now and then extravagant. Many a time, when neither the wife nor the daughter would willingly give a single pang to a fond father's bosom, they urge and teaze him to get articles, pleasant enough to be sure, to possess, but difficult for him to bny; he purchases on eredit, is dunned-sued; and many an hour made wretched by their folly and imprudence. Old Robert presents his compliments to the ladies, and begs they would have the goodness to read the last ten lines once a month till they get them by heart, and then act as their own excellent disposition shall direct,

Above all things good people, never go in debt to a tayern. To grog—to toddy—to sling—to bitters! Oh horrid! what a bill! Never owe your shoemaker, your tailor, your printer, your blacksmith or laborer. Besides the bad policy of keeping in debt, it is downright injustice to those whose labor you have received all the benefit of.

How harpy 's the farmer who owes not a pound But lays up his fifty each vear that comes round, He fears neither constable, sheriff nor dun: To bank or to justice has never to run, His cellar well fill'd, and his pantry well stored, He lives far more blest than a prince or a lord, Then take my advice, if a fortune you'd get; Pay off that you owe-and then keep out of debt!

Very Noble.-The House of Waldo & Ripley, in New York, failed some years ago, paid 50 per cent. and were discharged. Lately they have sent every

Stock Wanted. A pair of young cattle of the Improved Short Horne

oreed-they must be of pure blood, the Bull not less the two years old next spring, with a dark color, (not altgether black)—the Heifer might be of any age under tweets. The above cattle are to be sent to Washington, P ALSO, a young first rate Improved Durham Sho Horned Cow, with calf by some of the best bulls ne Boston, to go to Portsmouth, N. 11.

ALSO, a prime Cow, not over six years old, of son of the best breeds for milk, that will come in, in the cour of the ensuing spring-for a farm in the vicinity

Boston. ALSO, a prime cow of one of the best breeds for mil near Boston, about 4 years old, and with calf by some the bulls of the best stock for milk, to go to Providence Address J. B. Russell, Agricultural Warehouse, Bosto (post paid) with a particular description of the animal pedigree, age, weight, &c.

For sale, a fine MERINO RAM, imported last sprir from St Andero. He may be seen in this city. App. to J. B. Russell, office of the New England Farmer.

Durham Short Horns.

For sale, several of the pure breed, descendants of tl celebrated animals presented by Admiral Sir Isas COFFIN, to the Massachusetts Society for the Promotic of Agriculture. The pedigice of these animals can be given as far back as *Hubback*, who was calved in 177 and is reputed the foundation of this much admired stoc Also, several Heifers bred from the same, of vario grades, from half up to seven eighths blooded animal For particulars, inquire of E. Hersey Derby, Salem. Salem, October, 1830.

Mason's Pocket Farrier,

Comprising a general description of that noble and us ful animal the Horse; fifth edition, with additions. which is added a Prize Essay on Mules. By S. W. Pom 10y, Esq. of Brighton, Mass And an appendix, containing observations and recipes for the cure of most of f common distensiers incident to Horses, Oxen, Cov Calves, Sheep, Lambs, Swine, Dogs, &c, selected fre different authors. And an Addenda, containing the anni of the Turf, American Stud Book, mode of training, rul of Racing, &c.

Just published and for sale by R. P. & C. Williams,

and 20 Cornhill.

Also, on liberal terms, a large assortment of Agricult ral, Historical, Theological, Law, and other Bool Persons selecting Libraries, will find it for their advatage to call.

Treatise on Bees.

Just received and for sale at the Seed Store connect with the New England Farmer, 52 North Market-stree A further supply of a Practical Treatise on the Manag ment of Bees; and the Establishment of Apiaries, wi

the best method of destroying and preventing the depr dations of the Bee Moth. By James Thacher, M. 1 Price 75 cents,

Wants a Situation.

A Gardener who can produce unquestionable recor mendations for honesty, sobriety, and good moral chara ter, and who is perfectly acquainted with every brane of gardening, and cultivation of Grapes, wishes a perm nent situation in that capacity. He is a single man. It quire of J. B. Russell, New England Farmer office.

Published every Friday, at \$3 per annum, payable att end of the year-but those who pay within sixty days from t time of subscribing, are entitled to a deduction of fifty cent

No paper will be sent to a distance without payme being made in advance.

LESTEUTETTEL.

ADDRESS

DELIVERED BEFORE THE MIDDLESEX SOCIETY OF SBANDMEN AND MANUFACTURERS. AT THEIR ANNUAL FESTIVAL, OCT. 7, 1830. BY ELIAS PHINNEY.

Published at the request of the Society.

he short time allowed to the speaker, by the s of your Society, must necessarily confine him very limited view of those topics which would naturally to suggest themselves for considerat this time.

ction, rather than speculation, and to exhibit ical results, rather than theoretical schemes, he appropriate business of Farmers, on an oc-

n like this.

ne importance of the subject, on which I have the honor of being invited to address you, is eeply felt, and too generally acknowledged, to re either arguments to enforce, or eloquence to uzon its claims. It need only be said, that rst sod that was turned, was one of the first ed steps from a savage to a civilized life, and in proportion to his advancement in agriculand the arts of husbandry, man has, in all receded from barbarism. Compare, for a nt, the miserable condition of the houseless, ng savage of the forest, clad in the skins of , furious and ungoverned as himself, dependr his subsistence upon the uncertain fruits of hase, or the spontaneous productions of the with the substantial, permanent comforts of dustrious, intelligent and virtuous farmer ;ill not the contrast reconcile the cultivator of il, to a cheerful obedience of the divine comto 'eat his bread in the sweat of his brow?' all not trespass on your time, by a labored it of the progress of agriculture, from the tages to the present day. It is of little use old that the Emperor of China claims his rivilege of annually holding the Plough, from om of his predecessors, which he alleges to existed 'long before the creation of the or that the Egyptians, more than four id years ago, paid divine honors to Isis and to one of whom they supposed themselves d for wheat and to the other for the inventhe Plough: that almost three thousand ago, the father of poetry sung of fruitful nd golden harvests; or that Virgil, years

enough that we find the opulent, the powlevoting their wealth, their influence and ty, the honor, or the pleasure, of cultivasoil, as not to aspire to the honorable ap-

sures, as well as partake in the labors, of rustic by the farmer, if our agricultural ancestors had

Although, as Americans, we may be excused for farm houses. congratulating ourselves upon our agricultural skill, and upon the rapid progress we have made in the arts, and in all that contributes to social and domestic enjoyment, vet we should not forget, that we have much to learn. If the condition of the husbandman, in countries unaided by the light of science, and those moral influences, which, in our own, conspire to stimulate individual and social enterprise, has not advanced a single step, for centuries, in the arts of civilized life, we should not boast of our attainments, while we have so many prevailing errors to correct, so many inveterate prejudices to subdue.

What if the Devonshire farmer still adheres to the practice of transporting all the manure and produce of his farm, upon the back of his mule, and has never known the use of a pair of wheelsmay be not charge many of our Middlesex farmers with an ignorance of the uses of one of the most important of all implements to good husbandry. the roller; and in the use of ploughs, whose model would seem, in many instances, to have been taken from Egyptian Hieroglyphics, where it is represented with but little change from its rude and simple original, in the form of a sharpened stake?

What if the Spaniard still yokes his oxen by the horns, and others oblige their horses to drag the plough by the tail, does not the narrow and shapeless yoke used by some of us, indicate that little improvement has been made upon the straight pole and withes of former times, and that as little regard is had to the comfort of the ox, as to the interest of the owner?

What if the Russian peasant rejects the use of manure, and tells you that his fruit is poisoned if nourished by the filthy contents of his stable and ture best adapted to their improvement. hogsty; do not many of our barren fields and stinted crops show, that neglect in furnishing food for plants, has been no less detrimental to the interest none of such extraordinary fertility, as to allow of of the farmer, in the latter case, than an ignorance of its properties in the former?

What if the Irish peasant and the French Cottager, who literally dwell in houses of clay, are exposed to suffering and disease under the thatched roof of their floorless cabins; are not many of our farm houses, from their enormous dimensions and unfinished condition, as poorly calculated to give shelter and comfort to the owner? In travelten do we see the occupant suffering in his dreary wilderness of decaying boards and shingles, brod the learned of modern, as well as ancient ken windows, and shattered wainscoting, until, driven by stress of weather, he makes a retreat to culture. Who, then, is so regardless of building, whose contracted dimensions are better merchandize, and the perplexing duties of immense amount of worse than useless expendil whose unyielding patriotism and noble deeds of or professional life to repose on the tran-ture, that might have been saved, and the great daring have enrolled the yeomanry of Middlesex

guil bosom of rural retirement, and taste the plea- measure of comfort, that would have been gained adopted the English cottage style of building their

> Why censure the southern planter for his hay stacks, his corn ricks, and his exposed and houseless cattle, while so many of our own barns are built with so little regard to the cleanliness and comfort of the owner's stock, or the preservation of his crops? A mistaken notion is too prevalent, that hav cannot be kept sweet, nor cattle healthy, without a constant exposure to a free circulation of air. From the loose and disjointed construction of some of our barns, the stabling of eattle would seem to be, rather for the purposes of ventilation, than shelter. Depend upon it, that warm and comfortable lodging is as essential to the thrift of your cows and oxen, as it is to the health and comfort of the inmates of your family.

> These defects in rural economy are not confined to our own county or state. They exist in a greater or less degree in all parts of New England. While there are numerous instances which give striking evidence of the skill, intelligence and industry of the Middlesex farmer, the exceptions should admonish us that we have not so far outstripped our neighbors in the march of improvement, that we may rest contented with present attainments, and consider no further exertion on our part necessary.

> After noticing the defects in our buildings, let us occasionally look abroad upon our farms,-not merely to cull the flowers of spring, to revel on the summer beauty of the fields, or to banquet on the delicious stores of autumn; not to muse away sunny hours with Daphne, or to sport with Amaryllis in the shade; but for the more substantial and important purpose of examining their various soils, ascertaining their defects, and the mode of cul-

The diversified aspect of our country necessarily furnishes a variety of soils. We have, however, being cropped for a succession of years, unassisted by manure, without a sensible diminution of produet. The deep intervales and extensive alluvial tracts, which abound in some parts of our country, where almost the whole labor of husbandry consists in sowing and reaping, and no farther skill of the farmer is required than to know seedtime and harvest, are not to be found in Middlesex. The broken and rugged surface of our farms, made up he Christian era, extolled the pleasures of ling through New England we too frequently meet of hills and valleys of the roughest materials, ree, and the happiness of the man, who, far with a large unfinished and unfurnished house, as quires great labor as well as skill to subdue its stubme noise of cities and the perplexities of disproportioned in size to the wants, as it is illy born qualities, to preserve its natural strength, or cial life, cultivated his fields with his own adapted to the comforts of the farmer. How of- to restore its wasted energies. This, while it increases the labor of the husbandman, at the same time, gives him health of body and vigor for action, while he is happily exempted from the many evils which attend the cultivator of a more fertile ents, to the advancement of the interests some half underground corner, or contiguous out- region. This very rough and comparatively barren quality of our soil, though it may sometimes suited to his wants and his comforts, while his half | yield but a stinted harvest, and oblige the farmer finished mansion becomes a deserted castle, seldom to rise early, go late to rest, and eat the bread of of Farmer? Who does not wish to with- visited, except to bar the prescriptive rights of carefulness, has nevertheless produced an indepenom the anxious cares and uncertain plea- birds and reptiles? Consider for a moment, the dent, virtuous and happy community of farmers.

man liberties.

The three prevailing kinds of soil in this county are a light, loose soil, where sand is the principal ingredient,-bogs or swamp land, abounding not be questioned, when I recommend the sound earth not adhering close to the small fibrous rein peat, and decayed vegetable and animal substan- practical lessons of its enlightened editor, to the they can derive no nourishment from it. He ees,-and a thin, gravelly loam. These shall, each in its turn, receive a brief notice.

The principal ingredients in a good soil are sand, clay and lime or calcareous earth. Either of these, when existing separately, is found to be incapable of supporting vegetation; it is only by a due and proper combination of them, that a productive soil is formed.

The loose and open texture of a sandy soil greatly facilitates evaporation. It therefore requires a retentive, tenacious substance, to bind the parts together, and thereby to retard the evaporation of moisture, and the volatile parts of such animal and vegetable substances as may be mixed with it. Clay has been found to be the best adapted to this purpose. It has been ascertained that eleven parts of sand and one of clay will form a soil capable of supporting vegetation, but the more nearly equal the parts of each, the better will be the soil. By a judicious blending of these opposite qualities of the earth, the Messrs Wellington, two very skilful and enterprising farmers of the town of Medford, have converted their sandy barrens, and stiff, unyielding clays into rich, friable soils, of astonishing fertility. After making liberal applications of mannre, with but little effect, they have resorted to their sand banks and their clay pits, and, by an alternate application of each to the other, they have found them to be mines of wealth. I mention this fact, not only as illustrative of my position, but as a striking instance of the beneficial effects of the application of skill, acquired fresh stable dung, either will break down its coarse, from study, combined with practical experiments, which has resulted in a great increase of crops, attended by an actual saving in expense. For although these gentlemen may not be desirous of being styled 'Book Farmers,' yet they are no doubt reading and thinking, as well as practical cultivators. Books, I am aware, are a most distrustful source of information among many of my agricultural brethren. This ought not so to be. While the professors and friends of all the other arts and sciences, call to their aid the light and accumulated written wisdom of the past and present ages, why should the art of cultivating the earth, by far the most important of all the arts, be allowed no other guide than blind tradition?

To what are we attributing the recent rapid advances in agricultural knowledge? What has enabled the farmer to discover new sources of wealth and pleasure? What has staid the wasting mania for emigration, and taught our young men, that from a New England soil, and a New England fireside, more substantial comforts may be derived, than can be found 'beyond the mountains?' What, I say, has done all this, but books, and the scientific communications of literary men, who have devoted their wealth and their talents to lighten the burdens and increase the stores of the farmer?

Allow me, while on this subject, to advert to one source of information, which has been, in no small degree, instrumental in producing these famuch to arrest the withering power of ancient ditch.

among the boldest defenders of Grecian and Ro- custom-has not only taught us the theory, but has enabled us to realize the pleasure of fruitful of a spongy, loose texture, so open and por gardens, of smiling fields and luxuriant harvests, that the small roots of the upland grasses car I am confident the sincerity of my motives will fill the holes or cavities between the parts, and constant perusal, not only of farmers, but to we see that these grounds while in a state of every friend of rural economy.

The second variety of soil, which we shall notice, is the low, wet swamps and peat meadows, These are daily becoming better known, and their value more justly appreciated. The mud of swamps, which contains no peat, is composed mostly of decayed vegetable and animal substances. which having not been immersed in stagnant waters, but having been exposed to the action of the atmosphere, or the oxygen which it contains, have passed through a putrid fermentation, and thereby reduced to a rich, black mould, susceptible, preserve its existence through the summer. after draining, of being converted into very productive soil. Peat grounds are composed principally of vegetable and animal substances, which, having been immersed in stagnant waters, and thereby excluded from the action of the atmosphere, have not undergone a putrid fermentation, and therefore sull contain the acids, oils and gums, and in some instances, the sulphate of iron or copperas, and other antiseptic qualities, common to vegetables. These properties must be removed or neutralized by a combination with other, small, delicate roots refuse to grow, while the substances, before peat can become food for plants, either when subjected to field culture, or when it is to be used as a manure. Exposure to the air. when combined with a sufficient degree of moisture to prevent its becoming dry, or if when taken from the pit, it is spread upon the ground, and exposed to severe frost, or by mixing it with lime or vegetable fibre, destroy its antiseptic properties, and render it a valuable manure. Observing the effects of peat upon upland, where it had been spread for the purpose of drying it for fuel, I was induced to try it as a top dressing for grass, and found it to answer a valuable end, particularly if taken out in winter and spread upon the ground so thin as to admit of its freezing. When to be used for making compost, Lord Meadowbank recommends one load of fresh stable dung, to three of peat; a layer of dung from six to ten inches in thickness, to be placed between layers of peat, raising the pile by alternate layers four or six feet high, and allowing the whole to remain until it shall have fermented. I tried this plan for two seasons, but frequently found that the dung was injured, by too great heat, while the peat seemed but little benefited by the fermentation. I have periments which have fallen under our ow since adopted the plan of mixing the whole mass finely together, and have found the dung less injured by the fermentation, and the peat more equally operated upon, and more finely pulver-

The first step to be taken, in the process of reclaiming these swamps and peat meadow grounds, is to drain them thoroughly; unless this can be accomplished, all the labor and expense bestowed will, after a short time, prove to be useless. The method pursued by the most experienced cultivators, is to cut a ditch through the centre, another at the margin or outer edge, (the most essential vorable results. I mean the various periodical part of the operation,) to take off the water which publications of the day. At the head of these is constantly setting in from the surrounding upstands the New England Farmer. This has done lands, with cross drains from this to the centre

The surface of these low grounds is gener ture, produce little else than brakes, hellel pothos or skunk cabbage, and some others w coarse roots are capable of filling the pores vacant spaces, and finding nourishment among disconnected parts,

I planted a small patch of corn, the last set upon a piece of loose, spongy, peat soil, w had been newly ploughed. It grew well as as the blade was nourished by the kernel, when this was exhausted, it assumed a sickly pearance, and hardly found nutriment enoug was not owing to a want of nourishing mattthe soil, as was evident from the exuberant gre of pumpkins and potatoes in the immediate v ity of the corn, but because the small fibrous of the latter could not find it, while the co roots of pumpkins and potatoes filled the 1 and cavities between the parts of the soil, and ing brought in contact, derived sufficient nou ment from them. The same effect may be served upon a heap of coarse manure; plat coarser roots grow with wonderful luxurians

In order then to make this speices of soil ductive, something must be done after drai to divide the parts more finely and bring thereby in closer union, or the pores must be ed with a substance of more minute parts question then arises-what mode of cultulikely to produce the desired effect, and the to render it productive?

Four different methods have been pursue different cultivators; these are, paring and ing-covering with sand or gravel-plout and cultivating with fallow crops, and what is ed bogging, which consists in turning over turf or sward with the hoe or plough, and spreading on a light top dressing of loam or post. Each of these methods has its respeadvocates.

On the subject of parting and burning, wi have expressed different and opposite opinion Some of them strongly recommend the pracand others as decidedly condemn it. While: contradictory opinions and results serve rath distract than to calighten the practical farmer an find but little, from an observation of the spection, to enable us to come to a satisfa-

conclusion as to its beneficial or injurious eff A neighbor of mine,* ten years ago, pare burned about three acres of peat meadow and sewed it down with Rye and Herd's seed. While the salts, contained in the a continued to operate, which was for the two years, his crops were very good, -the third ; the produce was greatly diminished, and, that time, it has remained but little better the dead, unproductive waste, yielding much less before burning and of no better quality. unfavorable result in this case, had the effet prevent a repetition of the experiment by an the neighboring farmers.

To be concluded next week,

^{*} The late Dr Whitcomb.

MEADOW LANDS.

the Editor of the New Unclind Farmer-

ve to place the results of my practical observais, at your disposal.

Your correspondent J. B. of Winthrop, (Maine) s (information respecting flooding meadows, ere Fowl Meadow, Blue Joint, and the common t Grass and other kinds of uncultivated grasses line to grow.' The two former kinds of grass among the most valuable products of our naal meadows, and their growth is best promoted winter flooding. Several years since, I had on farm a tract of waste, wet, and unproductive unp, over part of which was a thick covering perennial moss with scarcely a blade of grass, on another part, a growth of bulrushes, flags coarse water grass of unsightly appearance no value. This swamp was reclaimed and sses, by the simple operation of flooding. ere were springs of cold water in the land, and hes were made to draw them off, in the sumscason, though a natural outlet to the swamp. embankment across this outlet was constructwith a flume and gate, by which the rains might retained and the meadow flowed, or the water off, at pleasure. The practice has been to shut n the gate in the flume about the 10th or 15th November, and to raise it first in the spring, r the termination of severe frosts; and occahe summer, to set the water again, for a few manufacturers. rs, over the meadow. No grass seed has ever iply done :- and no application has been made ie land, other than the water. This, in the ter, stands at the height of from one to three over the surface of the ground. The moss, rushes and flags have now entirely disappearand the product of grass may safely be esti-

have no personal experience of any husbandwhich has been more satisfactory. The land a being loose, spongy, and miry, is made firm theing compressed by the weight of the superumbent water through the winter, and is filled the roots of the grass, which are thus preservrom destruction of the frosts, and I have little ot, that in a few years this once impassable ass, may be travelled over by cattle and toams. leasure.

FRUIT TREES.

1 answer to 'One of your Readers,' from South ding, I have to reply, that I have suffered a injury, although in a slighter degree, from the h of calves in barking my young Apple Trees; I have also learned an effectual preventive s repetition. Early the last spring, I caused trunks of the trees in a young orehard to be shed over with a composition of lime, clay, fresh manure from the cattle linter, mixed ther and made of the consistency of a thin e, and afterwards and during the whole sumseason, I pastured several calves in the endure, without the slightest injury to a single While the calves would freely gnaw the of the fence, and the clean branches of trees

thrown in to them, they would refrain from the standing tranks, upon the first touch of their Sig. - Having noticed in your paper of the 21st tongues to the composition. I consider this mode , several inquiries by your correspondents, of preservation effectual, and believe you have alich I have it in my power to answer. I beg ready pointed out to your correspondent the only remedy for the mischief he has already sustained,

With great interest in the cause of Agriculture, and high regard for your valuable contributions to its advancement,

I am, sir, truly with respect and esteem, Your obedient servant,

Boston, Jan. 25, 1831. LEVI LINCOLN, CULTURE OF MADDER, BARILLA, AND WOAD.

To the Editor of the New England Parmer-

At a meeting of the Pennsylvania Horticultural Society, held on the 8th instant, the undersigned were appointed a committee to sinquire into and report what progress has been made in this country in the cultivation of dyer's Madder, and iow made a beautiful and rich meadow, giving whether it will be proper for the Horticultural Sondant crops of fowl meadow and blue joint (ciety to adopt any measures to extend its cultivation,' They were also instructed to include in their inquiries, 'the culture of Barilla and its preparation for the purposes of commerce.'

Impressed with the importance of the objects committed to their attention, they are desirous of collecting as much information as possible, before they adopt any conclusion upon the questions referred to them. This, they are aware, must depend, in a great measure, upon the liberal communication of facts and observations, on the part of those who are practically conversant with these ally when there are showers in the early part articles, either as agriculturists, merchants, or

With this view, they respectfully request that a sown, nor has any expense been incurred, you may be pleased to communicate to them such ept in the ditches, dams, and flume, which are information as you may possess, in relation to the cultivation of either of these plants-to the extent to which they are raised or imported into this country-to the preparation which they undergo, to fit them for commerce-to the fluctuations which have been observed in their abundance, and price in our markets-to their adaptation to the ed at the average rate of from two to three tons soil and climate of this country—to the diversities observed in the qualities of merchantable Madder, and Barilla, and to the causes which are supposed to produce these diversities-in a word, to every point which can throw light upon this

> Being desirous of giving to their investigation the widest range, the committee prefer submitting it to your attention, under this general aspect, than under the more restricted one of formal questions, They hope that the extent to which these plants minister to several useful arts, will be a sufficient inducement to secure the attention of all such as take an interest in the success of our agriculture and manufactures.

Respectfully,

wm. H. KEATING, Committee. MOSES BROWN.

Communications on this subject, may be directed to any one of the members of the committee, or to David Landreth, Jr, Corresponding Secretary of the Pennsylvania Horticultural Society.

P. S. Although the resolutions of the Society are restricted to the above mentioned plants, yet we shall be obliged if you annex any information you may possess, on the subject of Woad.

Philadelphia, Jan. 1831.

Advantage of swallowing a Snake .- A laborer at Parma, lately swallowed a young adder, during his sleep. An operation on his throat became necessary, and by some singular whim of nature, he found that he had afterwards an exquisite tenor voice. He is now a chanter at the Bologna Cathedral. This is the only good we ever knew to result from swallow-

There is now living in Chertsey, Eng. a farmer by the name of Wapshot, whose ancestors have lived on the self-same spot ever since the time of Alfred. by whom the farm was first granted. What is more remarkable, their situation in life has never been much elevated or depressed by any change of for-

Hog's Haslet .- A whole family were recently poisoned in Portland, by eating of the haslet of a hog which had been kept in a slaughter house. They would probably have died, but for seasonable medical advice. The remainder of the haslet was found to be covered with small ulcers, which convinced the physician that the animal had eaten poisonous substances for some time.

The queen of the Sandwich Islands indulges her royal propensity for eating to such a degree, that after each meal, she is obliged to be rolled about on the floor, and kneaded, like dough, by a strong, lusty attendant.

The flag of American Silk, presented to the House of Representatives by Mr Duponecau, is now suspended in the Hall of Congress, over the portrait

The King of the Netherlands, has presented to Mr Livingston of U. S. Senate, a gold medal, with this inscription :-

'To Edward Livingston, for the presentation by him of a Copy of the Criminal Code and Code of Proceedings composed by him for the State of Louis-

RAILROADS .- The late fall of snow, (12 inches) at Baltimore has made it manifest by experiment, that such depth of snow presents no obstruction whatever to the operations on the Rail Road.

Noble Premiums!-The Baltimore and Ohio Rail Road Company have offered a premium of \$4000 for the best Locomotive Engine, and \$3000 for the next best .-They are to be delivered for trial on or before the 1st day of June next.

By a letter received at Washington from London, said to be from a first rate source, it appears that a Locomo-tive, the Planet, belonging to Mr Steveoson, had been to Manchester, and back, (64 mites) in 58 minutes.

A young Penobscot Indian, named Pol Sosef, has discovered a strong passion for painting, and is said to give flattering indications of a real talent for the art. By the liberality of several gentlemen in Bangor, he is furnished with all necessary means of improvement. A real Indian Artist will indeed be a wonder.

COMMUNICATIONS.

FOR THE NEW ENGLAND FARMER.

THE STRAWBERRY

Is one of the most delicious and healthy fruits that is served upon our tables, and it is accessible to every person who cultivates a rood of ground at a trifling expense. It is particularly beneficial to the valetudinarian, and its virtues have been highly commended to persons troubled with calculus or tartar. I need not however, enumerate its medicinal virtues, as the rank it holds in the dessert is a sufficient inducement for its general culture, As this fine fruit is likely to be driven from our meadows by an improved system of husbandry, it is right we should adopt it in our gardens, where it will amply repay the expense of our care.

The most extensive growers of the Strawberry, are probably Keens and Wilmot, to whom we are indebted for two of our best varieties, to wit Keens' Seedlings and Wilmot's Superb, both of which varieties sprang from parents originally American. Those gentlemen are located in the vicinity of London. Each of their gardens comprises about 60 acres, and is almost exclusively devoted to the growth of fruit. The Strawberry plantations are particularly extensive, and many hot houses and pits are appropriated to the forcing of this fruit, The principal kinds cultivated are the two above noticed. They are planted in rows, two feet apart. and at the distance of 12 to 18 inches in the row, The ground is mulched with clean straw in the fruiting season, to retain moisture and keep the fruit clean. While in blossom they are regularly watered by wheel barrels, that is a barrel placed on a barrow, with a perforated metal cylinder, projecting about two feet on one side, from which the water is discharged upon the beds as the barrow is wheeled through the alleys. An abundance of moisture at the time of flowering and fruiting seems to be essential for a good crop.

The best guide for culture is the natural habit of the plant. It is fond of shade; and produces best in a moist, cool soil, abounding in black muck, or peaty earth. In its wild state it grows best on new lands. I think that chip dung would constitute a proper dressing for a strawberry bed. Hayne recommends a compost of one third moist virgin mould, including the soil, from a pasture, one third swamp earth, and one third the dung of neat cattle for a strawberry bed. Six inches of the soil to be removed, and the compost substituted in its place.

I have recently read an article against cutting the runners of the Strawberry, till after the fruiting season, but I cannot put my hand on it, or call to mind the reason assigned for this forbearance. I think however it was this,-that the plant immediately makes a natural effort to replace the lost stollens; and that in this effort much food is divested from the swelling fruit. The reason is plausiible, and the experiment merits a trial.

PIE PLANT

Albany, Jan. 17, 1831.

There are several varieties of Rhubarb cultivated in Great Britain, for culinary purposes. The leaf stalks are extensively used for pies, tarts, &c. Its culture for market was commenced there about 1815, and now it is said that more than 100 acres of land are appropriated to its culture in the neighborhood of the metropolis. Wilmot, the strawberry gardener, sends it by loads to Covent Garden market. It is coming into general notice and culture among us.

This plant is raised with very little trouble, about 50 acres of Salt Marsh full of salt po being a perennial, and is one of the earliest vege- the Marsh yielding about 33 tons of hay mi tables afforded by the garden. Half a dozen with thatch, creek stuff or coarse sedge. plants, growing at the distance of two feet each small expense it was drained with ditches 3 way, will supply a family. It is propagated by deep, 5 inches wide and 2 rods asunder; this seed or offsets. I have it early in April, by a stroyed the salt pends, killed out the course gr little extra labor. I place barrels, having one or and brought in Goose and Fox grass, and increase no head, over a few stools, or plants, in March, the produce to nearly 100 tons. The Goose g and cover and surround them with recent stable manure. The heat thus generated causes the plants to grow; and the light not baving access, the stocks become beautifully blanched, and soon reach the top of the cask. The acid of the rhubarb is very similar in flavor to that of the goose-

Albany, Jan. 17, 1831.

SEA KALE

Is getting into repute as an esculent, It may be readily propagated like horseradish. A piece of the root an inch long, placed in a drill, root end downwards, will grow and become a plant. To obtain it of its finest flavor, it should be grown in pure sand, and if the sand is impreg- or mine had ever been. nated with salt in situations remote from the seaboard, the plant will thrive the better. Sea Kale should be blanched, by covering it with pots, or raising a mound of earth round the plant, as soon as it begins to grow in the spring. It may be forced, like rhubarb, by covering with pots or boxes. and these with recent horse manure; but eare must be taken not to give too much heat, which ewt making \$114.59. will cause the stems to rot. J. B.

TRANSPIRATION OF PLANTS.

Dr Hales found that a sunflower, in 12 hours. transpired by its leaves, one pound fourteen ounces of water, all of which must have been imbibed from the soil by the roots. Water is the vehicle which conveys nourishment to plants. The food which it holds in solution is imparted to a plant in a manner analogous to the nourishment imparted to the animal system by the food which passes into the stomach. Hence the growth of the plant depends much on the presence of moisture, as well as of vegetable matter, in the soil. and upon the sufficiency of roots to take it up and convey it to the trunk. Thus a tree divested of a great portion of its roots in transplanting, makes new wood only in proportion as these are replaced by a new growth; and thus also a plant grows faster in a moist than in a dry soil (the fertility of both being alike) and faster in a mellow soil, where the roots can fully extend and multiply, than in a hard one.

These facts suggest to the farmer the impropriety of ploughing deep between his rows of corn and other crops, whereby the roots are broken and wounded, and exposed to the drying influence of the sun and winds. 2. The importance of keeping his crops clear of weeds and all useless plants, which rob the soil of food and moisture. And 3. the propriety of transplanting his trees while young, when the system of roots can be preserved nearly entire, and of surrounding the roots with a bed of mellow, rich carth.

Albany, Jan. 7, 1831.

FOR THE NEW ENGLAND FARMER.

SALT HAY.

respondent from Duxbury, in the last New England ner, I should have liked to have said method of Farmer, I would say, that some years since, I pur-farming, chased a farm in the vicinity of Boston, having

is usually cut in June, and the Fox grass in . and August in good weather, raked and cocked 3d day after mowing, when it looks quite gr and is kept in cock 4 or 5 days, if the weather tides will permit; then it is stacked or put un cover; fit is best to put it under cover if possib I use it in preference to English Hay for mi cows, working oxen and horses, and sell my glish Hay. My young cattle and sheep are k on the poorest of it. 100 full blood Saxony ; Merino sheep were kept on that alone the winter without English hay or grain; they from the stack when they pleased, and were under cover during the whole winter and were better case in the spring, than sheep usually

In 1827, I used a pair of oxen in doing a spring's work, and in getting in hav and harve ing; at housing time, I put them to fatting on 1 best salt hav and unwashed potatoes, giving th not a drop of water or liquid of any kind. Tl were slaughtered about the last of Decemb weighed 2236 lbs, and were sold at \$5.121 1

I prefer my best salt hay to my best Englis It brings more in the market when sold for tru or stage horses, or for cows or horses kept private use. It has been bought by stage on ers and sent to Billerica, they giving the high price that had been given for the best of Engli hay. It is thought to strengthen and enrich t manure more than English or fresh meadow ha

When salt marsh or fresh meadow is attach to a farm, it curiches the farm; these want no n nure and they help to manure the upland. If the are the same number of acres of marsh that the are of upland, more than double, the quantity stock can be kept, which will more than doub the manure, all of which will be for the benefit the upland. Fine salt grass well cured, mak cows in the winter and spring yield milk cor ously, and of the best flavor; but if it has bee wet, is musty, or of a coarse kind, it imparts very disagreeable taste to the milk.

The first salt havever used in this part of the country was given to an old buil, that the owne did not care whether he lived or died. Whe grass came he was very fat, while the other cattle were in very indifferent condition. Between 5 and 100 years since, many hundreds of acres of salt marsh in this place have been diked and con verted to English mowing, but within the last 20 or 30 years, the dikes have been cut away, and the salt water let in again in consequence of sal marsh being so much the more valuable.

It requires as good weather and as much attention to make salt hay well, as it does to make English hay well. The poorest salt grass, properly made, is preferable to the best river fresh meadow hav, whether horsemint or jointed grass (to say nothing of polypod or mount royal.) I have been a resident in the Old Colony for more than Mr Editor-In answer to your Salt Hay cor- 24 years. I am well acquainted with their man-VICINUS. Yours, &c.

CULTURE OF FLAX.

MR FESSENDEN-Mr Nathan Prindle, on the west bank of the Connecticut in this town, sowed a field with flax seed about the 8th of May last. The crop was unusually large and heavy and the seed very abundant; he pulled this on the 25th of July; much of the seed fell in this process. Immediately be sowed turnip seed on this field, and covered it with a brush harrow. In a few days there sprang up an abundance of both turnip and flax. This last grew slowly, but to the common size, and about the 1st of November put forth flowers, which were as large and as full as those of the first crop. This flax continued in full bloom till long after the frost had destroyed every other annual plant. Mr P, pulled this on the 19th of November ; I saw it then ; the flowers were scarcely shrivelled and the leaves not affected by the frost. The corollas were of usual size, the capsules were somewhat dilated, and the seeds formed, though green and milky. The stalks were thinly scattered, but they were as heavy as those of the former growth. It was thought this was more than one third as large as the other crop and probably if as much seed had been sown, it would have been equal to that,

The crop of turnips was as large as usual, some of them were very large: one, which I had in my room, measured about 20 inches in circumfer-

This instance affords to our farmers a suggestion whether two crops of flax could not be raised on the same field in one year. Here it is to be noticed, that the seed for the second crop, was of this year's growth ; could this have any effect in accelerating the growth of the second crop? Will he development of the vegetable life in the seeds be any more rapid, if there be no suspension of vital action between the process of formation and ripenng in the parent plant, and the sprouting of the new plant? We know that some seeds must be sown as soon as they fall from the tree, else they will not sprout. Others may be preserved for cenuries without impairing their vital power. But is here no difference in the rapidity of the growth of lants raised from the seeds?

The second crop of flax had the advantage of he immediate sowing, and though it had but a ew weeks of sunny summer and grew mostly n sterile, frosty autumn, it had all the fulness and igor of the more favored crop, and resisted the rost even to the last of November, which I had tot supposed belonged to the vitality of any flax.

Whether the continuance of the active life in the eed had any effect in this, I cannot say: but it is question worth the thought of the vegetable phyiologist. I leave it for your consideration, or for ome of your correspondents to answer.

I send you herewith specimens of both crops. I am, sir, yours respectfully,

EDWARD JARVIS.

Northfield, Ms. Dec. 27, 1830.

CULTIVATION OF SILK.

The following extract from the 16th volume of ne 'Historical Register' for the year 1731, will how that at so early a period, the culture of silk s a staple of the then colonies, had attracted the ttention of the Provincial and Metropolitan Govrnments. Under the encouragement and protecon which they afforded, it is known that large tion, the Province of Gilon and Nankin, and Mr Phinner's precepts.

southern provinces.

The present extract is from a paper, published in the 'Historical Register,' on the trade and navigation of Great Britain, by Robert Johnson, Esq. Governor of South Carolina, in the year 1730. The encouragement of the silk culture is recommended to the General Assembly and this paper exhibits its advantages. It is worthy of remark, that Governor Johnson's views and the opinions expressed by a late committee of Congress, of the peculiar adaptation of this country to the growth of silk, are of perfect accord. He care were taken to cultivate and improve the raising of silk, in our plantations, Carolina, Virginia, Maryland, and Pennsylvania, they would produce the best of silk. and as fit for organzine as any in the world, for these countries produce vast numbers of white and other mulberry trees, which grow wild and spring up everywhere in great abundance, which looks as if nature had called us thither to propagate that manufacture; and if put ou foot, would in time be of as great advantage to this nation, as any employment in the plantations; for, as I have already observed, the manufacture of silk is a most profitable undertaking, where the land and air are proper for raising it.

The vast riches of China, by this manufacture, is sufficient to demonstrate the great advantage thereof; and the extraordinary treasure the Duke of Savoy draws into his country by silk, which is made in that little Principality of Piedmont, as I have already observed, is also another instance; we may judge, if he draws above two hundred thousand pounds a year from England, what his profits are, which he draws from Holland and other places, where the manufacture is carried on to a very great degree.

We are informed the very land for planting of mulberry trees, in many parts of Italy is worth from three to five pounds an acre; and gentlemen there, as well as in Sicily, sell their mulberry leaves to the poor for half the silk they make, and the money is equally divided between them, upon sale of the silk, and that the leaves of a tree there, have yielded three or four pounds. Now, if the manufacture of silk, and the planting of mulberry trees, have raised the land to be so valuable, and some gentlemen receive such considerable revenues from their crops of leaves, very great things may be expected by our encouraging and promoting the manufacture of silk in our colonies, where as much land may be had for five pence, as in Italy for five pounds. And if great numbers of mulberry trees were planted among the Indian nations bordering on our settlements, and some skilful, good tempered persons employed to instruct them in the proper season for gathering leaves, and feeding the worms, and rewarding them bountifully for their pains, those people might be brought to be very profitable subjects to this na-

It may be noted that very few places are agreeable to the silk worm, and no part of the world better than in our colonies; no silk clearer, more glossy, of a better body, nor fitter to answer the imported from thence.

It is generally observed, that all those countries

quantities of raw silk were exported from the Chekiam, in China, all border upon the sea, and are pretty near the same latitude. Those places in Turkey that produce silk, border upon the sea, and Italy and Sicily, are in a manner environed by the sea; and the provinces of Granada, Murcia and Valencia, in Spain, the places that produce the best silk, as well as Languedoc and Provence in France, all lie upon the sea; Canton in China and Bengal in India, lie ten degrees more to the southward, the air of which countries being hotter is supposed to be the reason why the silk is of a baser sort.

As the great advantages that arise to Portugal and Spain, as well as to us in our sugar and tobacco plantations, is by the cheap labor of negroes or slaves, the same cheapness of labor might be of most prodigious advantage to us, if employed in our colonies, in the producing and making of silk; and when that is over, may turn their hands to raising and dressing of hemp and flax,* the charge being little more than their clothing from Eng-

We are told by gentlemen of good intelligence that the whole charge of making a pound of silk in China, does not stand in above five shillings; and almost any person, man, woman, or child, may work at it.

* The culture of cotton was not introduced into this country, until 1785.

new england farmer.

BOSTON, FRIDAY, JANUARY 28, 1831.

MR PHINNEY'S ADDRESS.

We have this day commenced the publication of the excellent Address of Elias Phinney, Esq. delivered before the Society of Middlesex Husbandmen and Mannfacturers; and are unwilling to let the occasion pass without expressing our bigh opinion of its value. His notices of the importance and progress of agriculture, of the erroneous theories and ridiculous as well as injurious practices of our native as well as of foreign cultivators —the absurd style of many of our farm buildings -on the utility of warm and comfortable lodgings' for cows and oxen-on the different sorts of soil, and the advantages which result from blending them-on the benefits which accrue to agriculture from the 'written wisdom of the past and present ages'-on the cultivation of swamps and peat land, are judicious and every sentence tells of something useful, and deserving a place in the record of memory as well as on the shelf of the Farmer's library.

On the last mentioned topic, in particular, his observations are of great practical utility, and the more so as they are derived not only from probable and rational theory, but have been tested by practice, under the superintendence of the author. His remarks on the possibility of making 'too great use of the plough,' on exposing the swards, by harrowing and cross ploughing and leaving it to be wasted by the sun and wind, and the stateuse of the fine thrown silk we have imported from ments of the process which he adopted to increase Italy, than the small quantity of silk that has been his crops, and diminish the labor and expense of culture are all practical lessons of incalculable value to cultivators in general, and especially to that produce the best silk, border upon the sea, those New England Farmers, whose soil and and lie pretty near the same latitude; our planta- circumstances may enable them to put in practice Farmer for December last.

BEES

The Editor of the Windsor, Vt. Chronicle, after copy-

Dr Smith doubts the existence of the gucen bee. To gentlemen cutting lucerne for hay, and it is Now we have never heard a bee promulgating laws or appointing subordinate officers, &c, but we have seen what may perhaps be worth telling of,

There was an empty hive at the north end of

such they appeared to be, would occasionally stop, Fruit was seriously inputed by the late frosts of and shake themselves violently, swinging or rather soon followed by the pouring out of multitudes, who made their way with all possible speed to the new hive. In a few moments the edd looking bee, picked up on the grass, was surrounded with a respeciable swarm, all was quiet, the usual labors of bees comenced, and in the end, a good summer's work of honey-making was done,-This, and having seen a number of bees of the same appearance, but never more than one in a hive, is all

MANGEL WURTZEL.

At the Doncaster Agricultural Society, Lord Alit economises labor, increases and improves the 13, speak of a small beetle, which at different thorpe described an interesting experiment which he made to as certain the comparative merits of Swedish turnips and Mangel Wurtzel, in the fattening of cattle; the result of which went to prove tho superiority of the latter. His lordship further observed that during the present droughty season, when the turnips had been nearly burnt up, or destroyed by the fly, Mangel Wurtzel had flourished, and was an abundant crop,-(Farmer's Journal.) A correspondent informs that Mangel Wurtzel may be used for feeding dogs, and that they are very fond of this root, while they will not eat the turnip.

> Recipe for Scalds and Burns .- Linseed oil and lime water each equal parts-the bottle to be shaken previous to the application, as the ingredients will separate lint or a piece of linen to be applied to the burn, and kept constantly saturated with the liminent.

> Futtening Fowls with Potatoes .- There is a great profit in feeding geese, turkeys and fowls of every sort, with potatoes and meal mixed; they will fatten in nearly one half the time that they will on any kind of corn, or even meal by itself. The potatoes must be bruised fine, while they are hot, and the meal added, -when the mess is given to them. -Trans. of Soc. of . Irts.

> The late Storm .- Our New England hills now wear the aspect of the olden time They are beautiful. He that 'maketh the clouds his chariots,' hath sent 'snow like wool,' It is piled in the streets from six to ten feet in heicht. The Common and the distant country are covered with a glorious sheen, and there is none so infidel as not to admire it.

> At New York, the storm commenced at 11 o'clock on Friday, and ended about the same time as in Boston. Eighteen inches fell there, and much damage is supposed to have been done at sea .- Mass. Jour.

AGRICULTURAL AGENCY, BOSTON.

Stock for Sale. No. 1.—Bull—Collins, got by Bolivar—dam Young FLORA, by Coelebs-gr. dam, the imported cow Flora, one year old last August-color red and white-price

\$150. 2.-Bull-Franklin, got by Bolivar-dam, a little imported English cow-six months old this month-color red and white-\$100.

3.-Bull-Dorser, 7-8 blooded, from imported Stock -seven months old this month-color red and white-

\$50. 4 .-- Bull-Tanner, got by Bolivar-dam Red Rose, by Coelebs-g dam a native cow-two years old next April-color mostly red-\$100.

5.—Heiter—Is abella, got by Coelibs—dam, Countess, by Coclebs-g. Flora-20 months old-in calf by

Cyclops—color mostly red—\$100. 6.—Heifer—FANCY, got by Bolivar—dam, Floriv one year old last December-color red and white-\$100. -Heifer-2 years old last April, white and red motfled, by Wye Comet," with call by Wye Comet, dam

Flora by Holderness, g. d. Belle by Denton, 7-8 blood \$100. 10 .- Heifer-2 years old last September, sired by Wye

Comet, yellowish red with a star on the head, with ealt by Wye Comet, dam by Holderness, g. d. Polly by Denton, 7-8 blood, of Sair form, not large-\$50.

11.-Heiter Calt-7 months old, red and white, by Wye Comet, dam Fanny by Holderness, g. d. Belle by Denton, 7-8 blood, fine form, small size-\$30.

12 -Bull Calt-7 months old, by Wye Coniet, dain No. 7, by Denton. g. d. by Denton, 7-8 blood, good size, but in rather poor flesh-\$10.

13 .- Bull-2 years old 11st October, white, by Wye Comet, dam Belle by Denton; 3-4 blood, wholly white, large, but in poor flesh-\$50.

15 .- Heiter-18 months old, red, by Wye Comet, dam Fanny by Holderness, g. d. Polly by Denton; 7-8 blood, believed to be with calf by Brougham, a full bred bull -\$50

16 .- Heifer-14 months old, red with one white spot, and white belly, by Wye Comet, dam Belle by Denton; 3-4 blood, rather poor, but with some fine points—§25.

17.—Heifer—2 years old this month, brownish red and white, by Wye Comet, dam a native cow, 1-2 blood

18 .- A large white Cow, (Ceres) which has taken a premium at Brighton. Her dam, the Hon. Mr Gray's imported cow, for which he gave \$200; her sire Coelebs. She is very large, and has been kept on 'only orchard grass, clover grass, and slops of Indian meal,' will give 20 quarts of milk a day, and is with calf by a son of Bol-

ivar—\$100. ALSO-GRAND MASTER, an imported Maltese Jack, full 13 1-2 hands high, 12 years old, a vigorous and sure mule getter-price \$700. (\$1000 was refused for him in

GRAND SULTAN, a young Jack, 2 years old last August, full 12 1-2 hands high, by Grand Master out of a fine Jennet imported from Majorea by Commodore Jones -he is vigorous, brought up with a Filly, and went to her the last season-\$500.

BONAPARTE, a Jack, 3 years old, 11 1-2 hands high, vigorous, and went to one mare the past season, the only one offered him-\$150.

PLUTO, a Jack, 7 years old, 12 1-2 hands high, bred by Hon. Charles Carroll, of Carrollton, Md .- \$250.

DESDEMONA, a large and fine Jennet, 6 years old, 13 hands high, in toal by Grand Master, to loal in April-\$200.

A large and fine young Jennet, 2 years old last August, out of Desdemona, by Grand Master, and believed to be with foal by him-\$200.

9 full blood Saxon Rams, and 11 full blood Saxon Ram Lambs, from the best stock imported into this countryone of the Rams cost \$170 in 1825, and several of the others cost \$50; will be sold at from \$12 50 to \$15 each.

Also, several half blooded Culves, got by Bolivar, from our best native cows.

-S25.

ALSO-Three Bull Calves, that will be large enough to go to cows in May next-two of them are 1-2 Bolivar, 1-4 Coelebs, and 1-4 of the breed that Col. Power's famous bull, Malcolm, descended from, (and for milk are considered very superior) viz. Galloway. The other bull is Bolivar and Fill Pail - \$10 each, delivered in Bos-

We have also for sale several first rate Dairy Cows, from several gentlemen in this vicinity, from \$10 to \$75 each; among which are a few full blooded Milch Cows and Heifers, from the stock of Gov. LINCOLN, which are reputed the first dairy stock in New England. Particulars of their pedigree, prices, &c. can be obtained on application in J. B. RESSELL, New England Farmer Office, Boston. If application is made by mail, letter

must come post paid to insure attention. ,
Pigs of the Byfield and Bedford breeds, and of Capt Mackay's fine prize pigs, will be ready for sale the en string spring.

SWye Comet, a thorough bred improved Durhim Short Hor Bull, begotten in England by Bluze, dam White Rose, fired b Charles Champion, Esq. imported by John S. Skinner, Esq. Ball.

Charless transpoor,
more,
timported by Gorman Parsons, Est, of Brighton,
(beaton, a thorough fired improved Durham Short Gorn Bull
by of by Mr Watherell, and tumorted by Stephen Williams, Esq.
Jan. 21.

Black Current Wine.

For sale at the Agricultural Warehouse, 52 North Market Street-

A few dozen bottles of superior old Black Curran Wine, made by a gentleman in this vicinity; an accounof its astringent and detergent properties in various com-plaints, and particularly the Sore Throat, will be found in the New England Farmer, vol. v. page 567, written by Samuel W. Pomeroy, Esq. and the late Dr John G. Coffin. Price 75 cts, per bottle-also, a few bottles of old White Dutch Currant Wine, price 50 ets per bottle. Dec. 31

Farm to Let.

To be leased, for the term of five years, or less, a small Farm in Andover, and within four miles of Lowell. A good place for the raising of vegetables for the Lowell HOBART CLARK. Market. Inquire of Andover, Jan. 15, 1831. 61 Jan. 21.

Silk Coroons wanted.

Cash and a fair price will be given at the New England Seed Store, No. 52 North Market Street, for about 20 Ths of prime Silk Cocoons, to be delivered soon.

Ammunition 3

Of the best quality and lowest prices, for sporting—constantly for sale at COPELAND'S POWDER STORE, 65 Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be refunded. If Jan. 7.

Bolivar Calves and Saxony Bucks.

For sale, 4 Bull Calves, sired by the celebrated imported improved Durham short horned bull Bolivar, which stock have produced 36 quarts of milk a day. No. 1, dam Grey Brown, balf Codebs and half Galloway, No. 2, dam Juno, three fourths Fill Pail. No. 3, dam Ceres, her sire Corlebs, her dam Mr Gray's imported Cow. No. 4, dam Beauty, half Collebs and half Galloway. The Calves are beautiful, and their dams all great milkers.

Two imported Saxony Bucks, 2 Yearlings, and 2 Lambs. Inquire of Benjamin Shurtleff, Jr, Chelsea, or at 52 Hanover Street, Boston.

July 9.

Farmer Wanted.

Wanted a Farmer, with a wife, without children, the one perfectly acquainted with the business and capable of taking the management of the Farm, and the other fully competent to take charge of the Dairy; none need apply without the best recommendation. Address the Publisher of the New England Farmer, Mr John B. Russell, post paid.

Also wanted, one or two Milch Cows, extraordinary milkers, handsome, and not exceeding 4 or 5 years old, for which a generous price will be given. Apply as above, post paid. No application need be made except for very superior animals. 6tJan. 28.

Brighton Market-Monday, Jan. 24. [Reported for the Chronicle and Patriot.]

At Market this day, 542 Cattle, (about 20 of which

were stores,) 1632 Sheep, and 595 Swine; -240 Sheep and 415 Swine have been before reported.

Prices.-Beef Cattle-From 3,75 to 4,50; several yoke were taken at 4,75, and one Ox for \$5, one extra yoke for Boylston Market, at \$6.

Barrelling Cattle-Mess, 3,50, a 3,621. No. 1, \$3 a 3 25

Sheep-Nearly all at market were stall-fed. We noticed sales at 2,50, 2,75, 2,88, and \$3. Also 3,50, 4 and 4,50. Several hundred remained unsold.

Swine-No sales effected-rather too many at market for the season.

New York Cattle Market, Jan. 17 .- At market 850 Beef Cattle, and 1200 Sheep. The number of Cattle, notwithstanding the unfavorable state of the weather, considerably exceeded that of the last market day, and the quality was superior, but the price not fully sustain-We quote a few extra at \$7,50; a number of lots good from 6,50 to \$7; several do. fair 5,75 a \$6; ordinary 4,50 a \$5 per ewt. We also noticed a very few extraordinary Cattle, for which the holders were asking \$10 per'cwt, but no sales were effected at that price.

Sheep .- The demand was good, and prices nearly the same as last reported; say for extra \$5, good 3,50 a \$4, fair 2,50 a \$3, ordinary 1,50 a \$2 each.

Pork, in hogs, 5½ to 6½ cents. The Beeves and Sheep were nearly all sold.—Jour. of Com.

MISCELLANY.

HYMN OF THE MORAVIAN NUNS,

AT THE CONSECRATION OF PULASEI'S BANNER.

BY H. W. LONGFELLOW.

The Standard of Count Pulaski, the noble Pole who fell in the attack upon Savannah, during the American revolution, was of crimson silk, embroidered by the Moravi- June was very unloyal in October. an Nuns of Bethlehem in Pennsylvania.

When the dying flame of day Through the chancel shot its ray, Far the glimmering tapers shed Faint light upon the cowled head, And the censer burning swung, Where before the altar hung, That proud banner which, with prayer, Had been consecrated there.

And the nun's sweet hymn was heard the while Sung low in the dim mysterious aisle.

Take thy banner!-may it wave Proudly o'er the good and brave, When the battle's distant wail Breaks the Sabbath of our vale, When the clarion's music thrills To the hearts of these lone hills, When the spear in conflict shakes, And the strong lance shivering breaks.

Take thy banner !- and beneath The war cloud's encircling wreath, Guard it till our homes are free-Guard it-God will prosper thee! In the dark and trying hour, In the breaking forth of power, In the rush of steeds and men. His right hand will shield thee then.

Take thy banner !- but when night Closes round the ghastly fight, If the vanquished warrior bow, Spare him !-by our holy vow, By our prayers and many tears, By the mercy that endears, Spare him-he our love hath shared-Spare him-as thou would'st be spared.

Take thy banner !- and if e'er Thou should'st press the soldier's bier, And the muffled drum should beat To the tread of mournful feet. Then this crimson flag shall be Martial cloak and shroud for thee !

And the warrior took that banner proud, And it was his martial cloak and shroud!

JUDICIAL OPINION.—The other day a man not very learned in the law, was committed to jail, as he said, 'on suspicion of debt.' He didn't like the 'construction' very well, and gave his opinion on imprisonment for debt in the following clear and logical style: 'There's neighbor Hardscrabble, and I; we were boys together. We used to go to the mug o' cider. By some twistification of luck, he's got rich and I poor. He keeps a store where he buys and sells for profit.—(I always got along, to be sure, by hard service—as Tom Tough said; till a while ago.) Says I, one day, neighbor Hardscrabble, I want a few dollars' worth of your comfortables, and, if luck turns right, I'll pay you one of these days. So he let me have 'em. The long an' short gitting trusted, he ought to be put in jail for trusting me !'-Independent Politician.

The U. S. Gazette translates from the Courier Des Etats-Unis, an anecdote, which proves how appointed to negotiate a treaty of peace with the dangerous it is for a man to stand still a few weeks, people of South Carolina, was desired by the govwhile the Spirit of the Age is rushing on like a ernor and council to speak his mind freely, and not steam chariot. A poor fellow in the simplicity of be alraid, for he was among friends:—I will speak ignorance, tried to hurra in a manner that would freely; I will not be afraid, said he; for why should please the Magistrates; and not having read the I be afraid among my friends, who never am afraid newspapers he did not know that what was loyal in among my enemes?

June, 1830.

Judge.-Gen d'armes bring the prisoner into court. −What is your name, sir?

Prisoner.—Peter Thomas, may it please your honor.

Judge - Peter Thomas, you stand accused of having uttered seditions cries against our illustrious hearing you vociferate 'down with Charles the X.!" that noble heir of the most ancient monarchy—the father of his people, whose paternal reign restores France to her ancient splendor. We must guard him against the insults of such a wretch.

Prisoner.—I was, saving your worship's presence, a little in my cups, when that escaped me, as my friend here, the officer, can testify, especially as he Just received and for sale at the Seed Store connected had been drinking with me, and then, instead of with the New England Farmer Office, No. 52 North helping me home, he ran and entered the complaint Market Street, against me.

to pay a fine of 16 francs, to undergo three months imprisonment, and pay costs of court.

October, 1830.

Judge .- Municipal Guards, bring the prisoner into court .- What is your name?

Prisoner.-Peter Thomas, may it please your

Judge.-Peter Thomas, you stand accused of having uttered seditious cries against our illustrious king. The citizens have trembled with horror at of the London Veterinary Medical Society. hearing you vociferate 'hurra for Charles X.!' that imbecile and cruel tyrant—the last of an odious family, which fell in aiming a blow at France: His name is forever proscribed.

Prisoner.-May it please your honor, I had just come out of prison, where I had been confined three months, without the possibility of reading a newspaper: and I was so happy to breathe again in open air, that, without dreaming of offence, I cried 'hurra for Charles X!'

Judge.-The court condemns you, Peter Thomas, to pay a fine of 16 francs, to undergo three months imprisonment, and pay the costs of court.

obstructed the avenues, and insulted those who were of Racing, &c. known to be friendly to the measure. One member on entering the House, exhibited his torn coat to the Speaker, complaining of his want of protection. Another lamented the loss of his hat; another had been hustled in the crowd, and if not really hurt, seriously frightened. Sir Frederick Flood who was a supporter of the bill, and equally entitled to the displeasure of the populace, boasted his superior end of the year-but those who pay within sixty days from the address in the following terms:—Mr Speaker, time of subscribing, are entitled to a deduction of fifty cents, they surrounded me too, and inquired my name;

To paper will be sent to a distance without payment now, Mr Speaker, I hate prevarication, but my name being Flood, I felt myself at liberty to answer "Wasame "school ma'am," when we wa'nt bigger than a ters," and so they let me pass without molestation.' The story excited great laughter.-London New Monthly.

> When the Esquimaux Indians saw Capt. Franklin and his officers with their blue coats, and gold epaulets, they eagerly inquired what animal it was which produced so fine a skin?

They seemed to regard everything which was of it is—I couldn't pay him when he wanted it: and landed in their territory, as their own, and at their now I'm here. Now if I ought to be put in jail for disposal. This custom Capt. F. supposed to be the consequence of the frequent wrecks cast on shore from the Pacific.

An Indian chief of the Creek nation, being once

A shopkeeper the other day in urging a lady to buy a gown of him, said, buy enough for the sleeves, madam, and I'll throw in enough for the skirt.

Durham Short Horns.

For sale, several of the pure breed, descendants of the celebrated animals presented by Admiral Sir Isaac COFFIN, to the Massachusetts Society for the Promotion king. The citizens have trembled with horror at of Agriculture. The pedigree of these animals can be given as far back as *Hubback*, who was calved in 1777, and is reputed the foundation of this much admired stock. Also, several Heifers bred from the same, of various grades, from half up to seven eighths blooded animals. For particulars, inquire of E. Hersey Derby, Salem. Salem, October, 1830.

New Work on Farriery.

The Veterinary Surgeon; or, Farriery taught on a new Judge.—The court condemns you, Peter Thomas, pay a fine of 16 francs, to undergo three months symptoms of each, and the most improved remedies employed for the cure in every case; with instructions to the Shocing-Smith, Farrier, and Groom, how to acquire knowledge in the art of Farriery, and the prevention of Diseases. Preceded by a popular description of the animal functions in health, and showing the principles on which these are to be restored when disordered. By John Hinds, Veterinary Surgeon. With considerable additions and improvements, particularly adapted to this country, by Thomas M. Smith, Veterinary Surgeon, and Member

Wants a Situation.

A BETOULEUEE.

ADDRESS

DELIVERED BLEOKE THE MIDDLESET SOCIETY OF USBANDMEN AND MANUFACTURERS AT THEIR ANNUAL FESTIVAL, OCT. 7, 1830, BY ELIAS PHINNEY.

Concluded from page 218.

Major Wheeler of Framingham, a good practid farmer, has been more successful in his atmpts at paring and burning. He has for three cars obtained great crops of hay from peat meadws, managed in this way, with no other manure ian the ashes produced by the burning; the crop very useful, practical hints, upon this subject. the third year being fully equal to that of either nd was probably not so deep as that done by Mr Theeler, who used an instrument drawn by oxen. he deeper the paring, the greater, of course, will ore durable the effect.

The objections to this practice, however, are, I prehend, well founded. That there must be a ry considerable loss of enriching animal and vetable substances by the fire, cannot be doubted. but when this has subsided, it will be found it the soil has been robbed of some of its esatial ingredients, having nothing left but a lifes crust, covering a dead mass of inert matter neath: and that fertility cannot be kept up, with-: frequent and expensive applications of ma-

vel, is better known, and its merits more genei of any of the valuable animal or vegetable ket, except at a reduced price.

bughly drained, I would never carry on gravel reclaiming these kinds of soil. nd, absolutely barren substances.' Thousands

objections to this practice.

is ploughing and cultivating with fallow crops, for post, was then spread over the whole, the grass one or more years, after draining, according to the seed then sowed, then bushed and rolled a second nature of the soil. This is decidedly preferable time. I have, for the three years past, taken from to either of the two last mentioned methods of this ground, two large crops of excellent hav, each managing wet meadow grounds.

the former years. The different results of and a quarter, is completely drained. It was barren spots, nor stated grass, as were frequently less two experiments may have been occasioned ploughed in the spring and planted, and promises to be met with in past grounds which had been a deeper paring in the latter than in the former to yield a good crop of potatoes. I design to plant ploughed and planted. By this method the soil is ise. My neighbor pared with a hand machine, it one year more, when I think all the sods and not robbed of any of its nourishing properties; hillocks will be completely broken, and then lay it all its valuable qualities are retained, and the loam down to grass, confident of success, from the re- spread upon the surface, filling the pores that might sult of a similar experiment, made upon a piece, of remain open, the fine roots of the cultivated grasses e the quantity of ashes from the burning, and the about one fourth of an acre, which from being im- find means of penetrating the compact sod, and passable and worthless, and filled with skunk cab- derive abundant food from the decomposing vegebage and other noxious weeds, is now the best table matter that was turned under. I have set piece of grass land on the place, and though drainthis acre over with apple trees, placing the roots ed and laid down after one summer's fallow, with upon the surface and covering them with loam, and manure, and sowing only a few turnips, with hec-they are quite as thrifty, and promise as well as 'hile the stimulating power of the salts contain- ings sufficient to break the soils to pieces, and af- my best trees, planted in upland. Upon the whole, in the ashes continues to operate, the produce terwards sowing with grass seed, and carefully I am fully satisfied, that this is the best mode of we give an abundant reward for the labor bestow- rolled, has this year produced two abundant crops reclaiming our wet meadow grounds, and with the of hay!

state the quantity of manure that was used, and economical. we are therefore unable to say how far his plan not been so successful. It may have been owing stantial objections to this practice. In the first the growth of the grasses, the texture of the soil or a new mode of culture absolutely necessary. te, it is very expensive, and in the second place, being too loose, and the cavities consequently too I am aware of your surprise, when I caution

and the necessity of frequent and expensive top being from three to five feet deep,) turned over dressings, are too well known and too generally ac- with a hog hoe; having first been completely knowledged, to require a statement of any farther drained. It was then rolled as hard as it could be, with a heavily loaded roller. A top dressing of The third method, and now the most common, six loads of loam and an equal quantity of comyear, the present year's crop being larger than The Rev. Mr Colman, of Salem and Lynn, a that of any former year. All the natural grass gentleman distinguished for his literary attainments, and coarse herbage, eem thoroughly exterminated, as well as for his agricultural skill, has given some and a firm and compact surface formed, which will admit of cattle and wheels to pass over it, without 'My meadow,' he says, 'consisting of one acre apparent injury. No looseness of surface, no such instrument invented and used by Major Wheeler this experiment, Mr Colman has omitted to for paring, I believe it will be found to be the most

The soil with which we have most to do, and to may with safety be adopted as an example by other which I shall next invite your attention, is a thin, farmers. My own experiments, in this way, have gravelly loam. The severe eropping, to which this has been subjected, for a long series of years, and The effect of covering meadows with sand or to a deficiency of manure, but I have attributed it the neglect of means to enrich it, either by suprather to the loose and puffy condition in which the plying manure, or preserving those nutritive prov tested. As this is not attended by a destructional was left after fullowing and laying down to perties which it may have occasionally acquired grass. My crop of hay was very small, and I be- by a temporary rest from its labors, have so far ditter, it may, for this reason alone, be preferable lieve the same cause, which had operated to pre-vested it of the essential qualities of a good soil, paring and burning. But there are two very vent the growth of my corn, had also prevented as to render, in many places, a total abandonment

oes not entirely exterminate the wild grasses, large to be filled by their small roots. The sward farmers against too great a use of the Plough. ch will be continually springing up, and root- or turf of peat meadows and swamps, is much more That ploughing excites to the immediate fertility out the cultivated grasses, unless there be fre- compact, and the parts much more finely divided, of the soil, will not be questioned; but this excitent and expensive top dressings, and as frequent than the peaty and loose substance which lies un-ment, like stimulating substances, tends to eventual ing of grass seed. Besides, I have always der the sward, and the more it is ploughed the exhaustion, unless adequate supplies of enriching id the produce of these gravelled meadows to more it is likely to become mixed with the coarse matter be made. On duly considering the expoof a coarse, ordinary quality, mixed with much and spongy subsoil. Any more ploughing or stir-sure to waste of the animal and vegetable substanhe rank herbage peculiar to wet grounds, far ring, therefore, than is necessary to destroy the ces, contained in the soil, by frequently stirring nutritious than upland hay, and unsaleable in natural herbage, is, in my opinion, not only unne- and turning it up, you will readily perceive that cessary, but highly injurious. Such a course, then, the plough, in the hands of an unskilful farmer, he late venerable and intelligent Col. Picker- as would be most likely to effect these two objects, may become an instrument of certain and speedy in an address to the Essex Agricultural Soci-viz. to exterminate the wild grasses and noxious destruction. Our hills and our plains were, at no of which he was President from its first es- weeds, and, at the same time, to preserve the na- distant period, covered with a deep, rich, vegetable shment, to near the close of his long and use- tural compactness of the sward, I apprehend, will mould, capable of producing abundant crops, withife, remarked, 'If meadows admit of being be found to to be the most advantageous method of out the aid of manure. What, but the incautious use of the plough, has reduced one to a hungry, These objects, I am confident, are more sure of gravelly knoll, and the other to nearly a barren collars have been expended in this neighbor- being attained by what is called bogging, which waste, approaching fast to absolute sterility. Will in burying the rich soils of our low meadows, consists in turning over the sward, or turf, with a not the same causes, which have changed the these 'absolutely barren substances.' The hoe or instrument made for the purpose, than by limitful fields of some parts of Northern Africa t expense, together with the ordinary quality any other process. In the fall of 1826, I had the and Asia Minor into barren, uninhabitable sands, e produce from meadows covered with gravel, sward of about one acre of peat meadow, (the peat produce the same effects in our own country? Let the same course of husbandry be pursued, for two three years' labor his soil has evidently become part of the soil, which had been turned up, and the fields in vernal beauty, for hungry sterility anxious to apply a remedy? will have rooted up the last blade, and destruction, over the naked land, 'expanded her raven wing.'

farmer, be used to preserve rather than to destroy their volatile properties, there can be no doubt, that by repeating this process for a few years, our poorest lands may become essentially improved. and be made to produce crops, that would richly compensate for the labor bestowed.

The course usually pursued, cannot but be attended with a constant deterioration of the soil. A field of matted and bound out green sward, is broken up, not turned over, in the spring, some days before planting, harrowed, then cross ploughed and harrowed again. By this stirring and throwing about the sods, by the plough and harrow, the roots and tops of the grass, and all the light, vegetable mould, are necessarily brought to the surface, and exposed to waste from the operation of sun and winds, and the poorer part of the soil, which should remain at the top to imbibe the enriching properties of the atmosphere, is, by the same cross ploughing and harrowing, thrown back into its cold and lifeless bed. The next season, it is ploughed. harrowed and cross ploughed again, and, if the first year's crop were potatoes, and the owner happen to be 'book farmer' enough to know the importance of a rotation of crops, he plants the second year with corn, and in order that evaporation and the winds may have their perfect work, in depriving the ground of the small portion of vegetable mould that remains, it is hauled into heaps about the corn, which, in this way, is left to find its nourishment in the naked valleys between the rows. The third year, the field is ploughed, harrowed, cross ploughed and harrowed again, and sowed down with grain and grass seed, and then, instead of the roller, to break down the lumps, loads of compost manure, made by mixing two will be readily seen, are a saving of more the press in the small stones, and set the earth close to the seed, the bush harrow is applied, which finishes the work, by leaving exposed much of the seed, and bringing to the surface many small stones, and the weeds and stubble of the former year's growth. If the field happen to be on a side hill, in addition to the above causes of wasting the hetter parts of the soil, will be its liability to be washed away by the rains, thereby to enrich his neighbor's grounds, or increase the alluvial possessions of some more fortunate proprietor.

After such a course of husbandry, without having applied more than an ordinary quantity of manure, will any farmer pretend that the stock of vegetable nutriment in his field has been increased? Does not the impoverished condition of his fields rather convince him that at the end of his turbing the sod.

hundred years to come, that has been, for the cen-poorer and less productive, than it was at the be-remained upon the surface, was thereby mix tury past, and it will require but a moderate share ginning of his course? If, on examination, such ed with the compost manure.—Corn was the of wisdom, to foresee the event. Spring might, should be his convictions, will not the provident planted in drills upon the furrow, the rows being indeed, return, and the showers of heaven descend, farmer be in some measure alarmed at what he at the usual distance and parallel with the fur but no longer to moisten the tender grass, or deck must see will be the certain eventual result, and be rows. At hoeing time, the surface was stirred by

sion, a course similar to the one above described, disturb the sod. What Mr Lorain calls the 'say Let the plough, then, the most important of all had been pursued, to my knowledge, for more than age practice of hilling up the corn, was cautiously agricultural instruments, in the hands of a judicious forty years. At each successive ploughing, it had avoided. As the season advanced, I carefull been manured, as well as grounds were generally watched the progress of my cornfield. In the the food, which nature has so bountifully provided manured by the neighboring farmers. The soil early part of the season, it did not exhibit a very for the nourishment of plants. Grounds, which was evidently becoming poorer, and the crops disprenising appearance; but as soon as the root are not entirely destitute of vegetable matter, may, minishing. In 1822, when I commenced operation between the enriching matter beneath by proper management, be made highly productive, tions upon it, the soil was thin, and the crops of and began to expand in the decomposing sward without the aid of manure. If the small portion the first three years, it having been cultivated in which had now become mellow, and more minute of animal and vegetable substances, which may be the usual way, hardly paid the expense of labor by divided by the fermentation of the confined ve found upon our thin, gravelly or sandy soils, be and manure, which had been bestowed. Good getable substances beneath, than it possibly coul turned under by the plough, and allowed to remain economy, then, would seem to require, that the have been by plough or hoe, the growth becamthere, secure from the wasting influence of winds field should either be abandoned, or that some vigorous, and the crop, in the opinion of those wh and other causes, which excite the evaporation of mode of culture should be introduced, which examined the field not less than seventy bushel should have the effect, either of increasing the of corn to the acre. As soon as the corn wa erop or lessening the expense.

> to grass, and the crop of hay so light as to be the surface then smoothed with a bush harrow worth not more than the expense of making, with a view of ascertaining the quantity of vegetable matter upon the surface, I took a single foot square of green sward, and after separating the roots and tops of the grasses from the loam and vegetable mould, it was found on weighing to contain nine onnces of clear, vegetable substance, giving, at that rate, over twelve and a quarter tons to the acre. This convinced me of the importance of taking some course, by which this valuable treasure might be turned to good account, That a great part of this mass of vegetable matter is exposed to useless waste, by the usual mode of ploughing, cross ploughing and harrowing, must be obvious to any one. In order, therefore, to secure this, as well as the light vegetable mould at and near the surface, which is liable to waste from the same causes, I had two acres of the green sward of this field turned over with the plough, as smoothly as possible. After removing the outside fur ow slices into the centre of the ploughland, and thereby effecting the double purpose of covering the vacant space in the middle, and preventing ridges at the sides and ends, the field was rolled hard, with a loaded roller, by which the uneven parts of the furrow were pressed down and the whole made smooth. It was then barrowed lengthwise the furrows, with a horse harrow, but so lightly as not to disturb the sod. Twenty eart parts of loam or peat mud, with one of stable dung, were then spread upon each acre. It was

Most of the remarks in the writer's account of his method of ploughing green sward, were published in 1829, in the New England Faroier, in answer to some inquiries on the subject, made through the medium of that paper, over the signature of 'Docchester.'-After making the experiment, and writing the account, a gentleman, to whom he showed the field and described the mode of culture, stated that the same method had been pursued by the late Mr Lorain, of Pennsylvania; and in a few days after, kindly sent him Lorain's excellent trea-tise upon husbandry. He had not before examined this work. Mr Lorain recommends turning over the green sward and planting on the furrow, but the following sea-son he ploughed as usual, and, in no instance does be state, that he tried the method of raising two crops of grain and stocking the ground down to grass, without dis-

running a light plough between the rows, but no Upon a field of eight acres, now in my posses- so deep, at this or the subsequent hocing, as t harvested, the stubble was loosened up by runnin In May, 1829,* the field having laid three years a light horse plough lengthwise, through the row and one bushel of rye, with a sufficient quantit of herd's grass and red top seed, to the acre, wa then sowed, the ground again barrowed and rol ed. The crop of 'rye was harvested in July fo lowing, and the two acres yielded sixtynine and half bushels of excellent grain, and over five tor of straw. The grass seed, sowed with the rye took well, and the present season I moved, whe those who secured the crop, judged to be two ar a half tons of the very best of hay from eac acre.*

Thus, with one ploughing, with the aid of twen ty cart loads of compost manure to the acre, have obtained two crops of grain and stocked the land down to grass.

The soil upon which this experiment was man was a thin loam upon a gravelly subsoil, and aft stating the fact, that it had before, in the usu mode of culture, yielded but about forty bushe of corn to the acre, and less than half that qua tity of rye or barley, and, with the exception the first year after laying down to grass, a crop hay that but little more than paid the labor of m king, the beneficial effects of this mode of ploug ing green sward, would seem to be established b youd a doubt. Other parts of the same field ha been ploughed and managed in the same wa and promise results equally gratifying. The vt nable ends attained by this mode of culture. half the labor, a doubling of the produce, a retai ing of much of the enriching master found up then harrowed again, as before, and the poorer the surface, which by the usual mode of ploug ing and cross ploughing is dissipated and given the winds; and add to these advantages, wh

^{*} The writer's first experiment in this method of ma aging sward land was made upon a piece of worn o pasture land in 1826. In the month of August the swa was turned over as that as the condition of the land wot allow. It was then rolled and harrowed, the same we with the furrows, and Buck Wheat, with herd's grass a red top seed sowed upon the furrow, without the use any manure. The crop of buck wheat was pretty go In the spring following, the grass looked so promising was reserved for mowing, and yielded a very good cr of excellent clean hay, and as pasture land has afford more than double the feed for cattle that it did before ploughing. The field was harrowed and rolled after so f

ad will sufficiently bury the clover seed. In the through the manure. ext August or September, plough again, and sow ressing of compost manuret can be afforded at control, ich ploughing, the increased produce would, no ore of expense, it may be worth trying. The turned up.

pth of the ploughing must depend on circumnces, such as the natural depth of the soil, and quantity of manure to be applied. It would be surd to attempt to prescribe rules on this subt. We might as well give rules for the strength

An important subject of consideration in this tem, is the manner in which manure should be died. If fresh stable dung or long muck, as it sually called, is to be used, it should be spread on the surface and turned under the sward. fears need be entertained that by thus turning nder, the crop will lose the benefit of it. The ching volatile matters that are thrown off by

It may be said that many of our fields are too rough and too full of stones, to admit of their being turned over smooth enough to allow the seythe to follow the plough. A remedy for this difficulty is within the reach of every man of ordinary health. our teams, or the size of our ploughs, which But this, it may be replied, would be attended with st depend on the purposes they are intended to expense; and so the farmer will continue from year to year, to work among stones, which have borne the marks of the plough and harrow for half a century, when they might be removed with much less labor than would be saved by adopting the system that I have suggested.

> The mistaken notion is too prevalent among farmers, that no experimental operations can be made, no change of system introduced, without burdensome expense. It is true, that the wealth stance. Mech. Mag. of the opulent has done much, but mental research and a spirit of inquiry, accompanied by the personal inspection and persevering efforts of the practical farmer have done much more, to increase the produce and improve the condition of our farms.

This is most forcibly illustrated by Pliny the el-

'Furius Cresinus, an emancipated Roman slave, having obtained from his very small estate, much larger crops than his more wealthy neighbors from piece at the end being narrow so as not to retain the their vast domains, they became so envious, that they charged him with employing enchantment, to attract into his grounds, the produce of their fields. Having been summoned by Spurius Albinus, and being fearful of condemnation, he introduced into the forum, as the tribes prepared to vote, his robust and well clad family, and his agricultural implements, his heavy mattocks, his ingeniously constructed ploughs, and his well fed oxen, and privy, the waste water from his sink, and even his hen then exclaimed—Behold! Roman Citizens, my duced by the construction of the rail road.

magic; but I am still anable to show you, or stant vigilance my fatiguing labors .- Scarcely had he concluded, when he was absolved by public acclamation.

It is in enterprise, study, unremiting study, vigilance and industry, more than in money, that the mystery of great crops and successful husbandry

Is it not too common a practice, among our farmers, to consider that when harvesting is over, tho labors of the year have ended? After the six months of seedtime and harvest have passed away, instead of employing himself and his team, in removing the stones from his fields intended for the plough, and clearing the unsightly bogs and bushes from his low meadow grounds, and converting them into verdant lawns and fruitful fields, his carts and other implements of husbandry are laid aside, his oxen tied up to meadow hav, and the owner, whose dread of the expense, sits like an Incubus, upon every effort toward improvement, confining his winter's operations to the wood pile and hav mow.

The wholesome admonition of wisdom, may well be addressed to such farmers, 'He that will not plough, by reason of the cold, shall beg in harvest, and have nothing.'

Copperas .- It having been discovered some time since, that there was a bed of the iron pyrites of uncommon richness, in Hubbardston, in this county, a manufactory of copperas has been established at that place during the present season. We have just examined a barrel of copperas and judging from its appearance, we should think it superior to any we ever before saw. We understand it can be afforded at a very low rate. This is one of the articles, the manufacture of which is protected by the 'odious tarifl,' and the consequence has been to reduce the price from 7 or 8 cents, at which it formerly sold, to 2 to 3 cents per pound.

COMMUNICA CLONS.

FOR THE NEW ENGLAND FARM! R.

OBSERVATIONS ON POST AND RAIL PENCES, STONE WALLS AND LIVING FENCES.

In 1814, I bought white codar rails (Thuja occidentalis vel Arbor vita) at \$8 a 100 and 50 cents a 100 for sharpening. Cost of a rail \$5 cents. and posts of the same kind at \$8 for 60, and 5 cents for mortising 5 holes in each post; cost of a post, 184 cents. 3 lengths of rails, set nearly 2 rods; 15 rails cost \$1,271; 3 posts (omitting the 4th post) cost 55 cents; expense of the materials, exclusive of the setting, \$1,821 for 2 rods.

The posts and rails were of good cedar, of sufficient age and of large size. Nearly all the bottoms of the posts are rotted off, the rails considerably worn, many top rails broken by the heavy bottoms of lazy gunners who get over the middle of a length of fence, instead of getting over near

In 1830, I purchased large sawed white pine rails (Pinus strobus) 2 inches thick, and 8 inches wide, already sharpened, at \$7 a 100, and good chesnut posts (Castanea vesca,) with 4 holes each, and sharpened at \$15 a 100. These made higher, stronger, and closer fence than the cedar, and at only \$1,29 for 3 lengths or 2 rods.

Stone wall can be laid from 33 to 50 cents a rod, provided the trench is dug and filled with small stones, and the large stones are drawn and laid by the trench; but if the builder of the wall has to dig the trench, and fill it with small stones, and then dig and draw the large stones and lay them, it will cost to make a good wall 4½ feet high, from \$2 to \$5 for 2 rods, according to the size, nearness and difficulty of procuring the materials. 42 Virginia thorn plants (Cratagus cordata) are sufficient to set 2 rods of hedge; S spare plants will be suffieient to set in a nursery for repairs. 50 plants at \$5 a 1000, come to 25 cents. The ground can be prepared, and the plants set at less expense a rod than post and rail fence can be set or a trench dug properly for a stone wall.

White Cedar fence a rod (exclusive of setting.) 913 Sawed rails and chesnut post do (exclu-

sive of setting,) Good 41 feet stone wall, a rod, from \$1 to 250 Hedge a rod (exclusive of preparing and setting,) The land for setting a hedge should have been

under culture the previous year, Plants for setting and preparing one rod of

hedge, Preparing land and trench, cutting, sloping, and covering thorns,

1st year, 3 hocings, and 1 clearing away leaves in autumn, 2d and 3d years, 6 hocings and 2 trimmings

of side branches, and 2 clearings, 4th year, 3 hoeings, one trimming of side

branches, cropping the tops down to the height you wish your hedge to remain, and one clearing away of leaves in autumn. Allow for manuring and contingencies.

04

If white beans or flat turnips should be planted, well hood and manured, you will get profit sufficient to pay for the manure and hoeing, and that will manure the plants sufficiently and nearly hoe them.

valuable.

Caleb Kirk, Esq. of Brandywine, Del., who possesses and has communicated more information on hedges, than any man in this or perhaps in any other country, says in a letter, dated Jan. 21,1831. Though I am not any longer a farmer, I feel suits, and more especially in live fearing-which occupied my close attention upwards of twenty years practically-my neighborhood evinces the benefit of it.

'A small district in my neighborhood exhibits the best specimens of hedging in this country or perhaps in any other to be found; they have been visited from a great distance, by many that are on the search of making living fences, and universally admired. Our English farmers are willing to give them credit.

'I had made calculations years past, with practical knowledge of the subject and found they might be completed for 40 cents a rod, and maintained ever after by careful trimming annually, when the shoots are young and tender, say in June, at one cent a rod, though I should go over them twice in the course of the summer, and save labor too.

If the land shall have been under culture and well manured for one or two years, and protected from cattle, horses, sheep and bogs, were I a hedger, with the limited knowledge I possess, I would engage to find the plants, set and train them, till they become a competent fence, for 50 cents a rod, and make a handsome profit by the bargain,

If the above is worthy of a place in a paper, that should be read and preserved by every Farmer in New England, it is at your service.

Yours, respectfully.

BENJAMIN SHURTLEFF.

FOR THE NEW ENGLAND FARMER.

SALT HAY.

I perceive in your valuable journal of the 21st inst, that a correspondent bailing from Duxbury, is inquiring what is the 'efficacy and benefit of using salt hay,' I must confess that I was not a little surprised that such an inquiry should be made at this late day, and more especially that it should emanate from Duxbury. I do not admit that \(many farmers on our seacoast spend half the summer with a strong gang of workmen in mowing the salt marshes, and in curing and making hay-exposed to the wet and cold, and both night and day watching the tides in order to boat and secure what appears'to him to be a 'useless commodity.' The author of the article alluded to must admit, however, if he belongs to the town of Duxbury, that not only more than one half the stock kept in that town subsists through the winter season upon that 'useless commodity'-but also that more than one half the cash, annually pocketed by the farmers of that town, is derived from the sale of that self same commodity.

The scythe is very rarely seen in the salt marshes previous to the middle of August, (when much Loudon says 'Paling fences are only to be con- more than 'half the summer' is past and gone) and

sidered in a secondary light; for, of whatever seldom does it linger in the most backward meawood they are made, however substantially they dows, or in the hands of the most sluggish farmers may be executed, or in whatever situation they until after the first of October. Furthermore, are placed, their decay commences the instant this description of grass requires much less attenthey are crected. Where permanent use there- tion and labor to fit it for the barn, than does either fore is required, palings ought never to be adopt. English or fresh grass. If the meadow be high. ed; but for ornament in pleasure grounds, or for the grass is spread, and is untouched in ordinary the protection of young thorns, they are highly weather, from four to seven days, when it is turned: in which latter position it remains for a few days: when it is thrown into cocks, in which state it stands until housed or stacked, at the pleasure of the owner. The salt grass which is mown on low meadows is generally removed in a green state to the upland, in which it undergoes the same process gratified if I can aid them in their landable pur- as the former, and the land on which it is spread is greatly benefited thereby, more especially should it be washed by showers of rain while thus remaining, (a circumstance which causes but trifling if any injury to the hay). In the vicinity of Duxbury, it is the practice of farmers who are blessed with this article, to stow it away in the barn, or stack it, with a due mixture of barley, oat, or rve straw, each 'commodity' being much improved by the admixture. The value of this description of hav is greatly enhanced by chopping it and mixing it with indian meal. Some of the best teams in the neighborhood of Duxbury are fed almost entirely in this way. Salt hay, chopped and mixed with four quarts of indian meal per day, will keep a horse, or the largest sized ox, while at hard labor. in time heart and flesh, through the winter-an ox of a smaller size requires a proportionably less quantity for the same purpose.

Salt meadows are also in a less degree affected by heat and cold, flood and drought, than are either English or fresh. The crop is more uniform and in case of early drought, salt hav is almost ar indispensable article to the farmer in that vicinity In addition to all this, the annual expense of manure and fences necessary for the protection and curing of English and fresh hay is saved in the production of this species of fodder. With these facts staring him in the face, will your Duxbury correspondent ask for further information upor the subject, or will be waste his time and sense of a subject of which he avows himself ignorant The machine for chopping hay above referred to may be procured for the trifling sum of five dollars and a man may cut and prepare a daily allow ance for eight oxen in twenty minutes.

Plymouth, Jan. 24, 1831. AGRICOLA.

FOR THE NEW ENGLAND FARMER.

THE MIDDLESEX REPORT ON FARMS.

Mr. Epitor-Two communications signed 4 small Farmer,' having appeared in your paper, rela ting to a report which was signed by me as chair man of a committee on farms, you will excuse m in noticing them, at least so far as I am personal; implicated. My absence from home and the state of my health, prevented my asking a place in you last paper.

The first article, having been sufficiently expos ed by Capt. Wheeler, I shall be confined princi pally to the last. That charges me with using the signature of Capt. Wheeler, and with publishing falsehoods, which from their nature must have been intentional, hesides being contradictory to the re

As to Capt. Wheeler's communication, it wa handed you by himself (for so he tells me) and pro bably is to be seen on your files; and I am entire! indifferent, whether it shall be believed that I ha

Il approbation.

either of those facts were mentioned to the commitpported in that pasture, I mentioned the fact. 1 of his term of office? ped however that Mr Buckminster would excuse As the Small Farmer' in his last article does not ted. I also know, as did all the neighbors, that have been employed in the dressing. horses had been often let for journeys; and I em grain plentifully. I did not make this known ters, the committee, nor did it occur to me; and this more easily happened as Mr Buckminster's own tements, connected with the view, did not preit a case which occasioned any difference of nion in the committee as to his claim to a pre-

I have said that the . Small Farmer' charges me h publishing intentional falsehood. I will state ledge.

what the charge consists.

Capt. Wheeler had published the fact that Mr kminster's cows, had enjoyed the principal beit of a vote of the town, restraining cattle from ning at large. The Small Farmer after charging with using Capt. Wheeler's name, adds the foling : ' I have made some inquiry of the field driof that District, who informs me that cattle are allowed to go at large in the town of Framingn, and that if he had found Mr B.'s cattle taking benefit of the art, he should have driven them to pound, and that the last cattle he impounded, bered to the chairman of the Committee.

This was intended to make the impression that B.'s four cows had not been at large the past son at all, notwithstanding my publication to the trary, and that my cattle instead of his had ened the principal benefit of the town's vote!

shall now state a few facts, well known in this age, and leave the public to judge, who it is that

lishes intentional falsehoods.

The Field Driver in this District of this year, is Isaac Stevens. No one has made any inquiry im on this subject; and he has never impoundmy cattle. And who then does the reader supwas intended by 'the field driver of that Dis-,' who has been so very fuithful and vigilant? y the field driver of 1828, to be sure! not Mr ah Stone, who was chosen in 1829. Nothing ld be got of him to make a story of; for he es the same statement as Mr Stevens, -... And that the whole of this small game may be erstood, I will relate what took place in 1828. Gardner Kellogg, who lives half a mile from B.'s was the field driver of that year. He imnded my cattle, at my request, having turned n out, as I stated at the time, to induce the I driver to begin his duty with them. After a days he did so, and I believe it is true, that e were impounded by him afterwards. What acat Mr Kellogg has given to the 'Small Farmer' ny one else I am not informed-the facts are

he had seen Mr B.'s four cows taking the benefit and improvement. One hundredth part of what the Having said this, I choose to relate the circum- of the act the past season, he would have driven ances connected with the two first mentioned by them to the pound, can be best told after the Small | the General Government, appropriated to dissemiapt. Wheeler, and not contained in the report. Farmer' shall have solved the following question.

by Mr Buckminster, though he was very particul county, put upon a farm from 1810 to 1818 inr and full in his statements. That his four cows clusive' would produce hay for the 'four or five d often run at large the past summer was well years last past' in as great abundance, as if put on nown to me, and when one of the committee said the farm for the 'last nine years'-how long will me that the cows looked too well to have been in field driver continue in power after the expiration

for not exposing, in the report, what he had deny that he is Mr Buckminster himself, as had the propriety of authorizing and empowering nitted to mention; especially as 1 submitted to been more than intimated by Capt. Wheeler, I shall the Governor forthwith to take measures to ads inspection the part which related to him, and if not salter my mind, at least, till Mr. B. shall deny had required me to insert that his cattle had run it. The raw material was certainly raised on the large, he should certainly have been accommo- farm and dyed in the wool, though a fuller may

THE QUINCE.

Mr Fessenden-The following interesting items are taken from the Library of Entertaining Know-

In the south of France, particularly on the borders of the Garonne, the Quince is very extensively grown; and the peasants prepare from it a marmalade, which they call cotignac. The term marmalade is derived from the Portuguese name for the guince, marmelo.

Two centuries ago, marmalade seems to have been in general use, principally from a belief that it possessed valuable medicinal properties. The seeds of the quince are still used in medicine, on account of the great quantity of mucilage which they wield to boiling water,

The Chinese, who are said to earry the cultivation of fruit to much greater perfection than the European gardeners, are stated by Marco Polo to have pears, white in the inside, melting, and with frosts. a fragrant smell, of the enormous weight of ten

The fruit catalogue of the London Horticultural Society contains above 600 varieties of the Pear; and it is there observed, that 'the newly introduced Flemish kinds are of much more importance than the greater part of the sorts, which have been hitherto cultivated in Great Britain, and when brought into use will give quite a new feature to

The names of fruits in all countries, oceasionally present some langhable anomalies, such as the 'Bon-Chrêtien Turc,' one of the finest of the French Pears.

FOR THE NEW ENGLAND FARMER,

SILK.

The prosperity and happiness of our people greatly depend upon constant employment and moral improvements. No pursuits seem more favorable to afford both these objects, than the culture and preparation of silk. These may be carried on in each family, and at all seasons of the year. No employment can be more favorable to remembered by many; and I have no reason side of every family. Something should be done the expense.

by agency in it or not, since the article meets my to think that he has misstated them. Whether if by the state to advance this new species of inter-State of Massashusetts is about to receive from nating a knowledge of this business would ultimately yield a vast capital to this Commonwealth. A practical silk grower should be sent to attend the annual Agricultural Exhibitions, in each county in the Commonwealth, and gratuitously distribute the seed of the mulberry, and the eggs of the silk worm, with oral practical instructions on the subject, at the expense of the state.

I would beg leave to suggest to our Legislature vance this new, important and useful business. There seems to be a field of internal improvement here that should not be neglected.

A FRIEND TO INDUSTRY.

THE SEASON.

MR FESSENDEN-1 should like to see the comparative forwardness of the last spring in Illinois and Massachusetts exhibited in your paper. I furnish you below with a statement extracted from the Illinois Monthly Magazine .- The Roxbury Farmer' could give a similar statement for Massachu-

Washington City, Jan. 1831.

Ipril 1. Peach trees in blossom.

2. Asparagus fit for the table. 3. Peas, Beans, and Onions planted,

6. Hearts-ease, and Violets in bloom.

7. Beets, Carrots, Parsnips, and other roots planted.

" 10. Prairies green, Gooseberry and Current bushes in bloom,

15. Cabbage plants transplanted.

" 18. Lilac in bloom, Strawberry vines ditto. " 25, Raspberries in bloom.

" 27. Lettuce, Radishes, and Pepper-grass fit for use.

" 30. Roses and honeysuckles in full bloom. None of the above articles were injured by

India Rubber .- This valuable product, first made known by La Coudamine, in 1736, is the juice of several species of trees growing in South America. It flows from the trees as a milky fluid. which soon hardens upon exposure to the air Various attempts have been made to transport it to Europe in its fluid state, without success. Its application to the arts is various, but until recently, no advantage has been taken of one of its most remarkable properties, its elasticity. Two ingenious chemists of Paris, Messrs Rattier and Guibal, by an entirely new solvent and a very delieate process, have succeeded in spinning it into threads of various sizes. This is subsequently woven into suspenders, garters, surgical bandages for ruptures, fractured or dislocated limbs, &c.

Economy. - Some persons are ashamed of this virtue, for a virtue it is, and the reverse of it, wastefulness, is a sin. Many are penurious, and they call it being economical; but a person may spend or give money liberally, and be withal very economical.—True economy is to spend only what one can afford and that judiciously. Some moral improvement and domestic virtue, than people will sooner spend what they cannot afford that which can be innocently carried on at the fire or use a little deception, than say, I cannot afford

ENGLAND FARMER.

BOSTON, FRIDAY, FEBRUARY 4, 1831.

At the suggestion of many of our subscribers, we contemplate publishing the New England Farmer, after this week on Wednesday evening, so that they can be packed and sent away by the mails of Wednesday night. By this arrangement a large proportion of our subscribers, living out of this State, who do not now receive their papers till the beginning of the ensuing week after they are published, will receive them two, and in many cases three days earlier.

LEGALIZING THE STUDY OF ANATOMY.

We have received a long, elaborate and very able Report of the Committee of the Louse of Representatives on this subject, neatly printed in a pamphlet of 118 pages, 8vo. A cursory perusal convinces us that this doenment contains a large mass of interesting matter-that it is ably written, and displays an extent of research, and ability and judgment in selecting and compiling worthy of the importance of the topic it discusses. We shall advert to this valuable document again as soon as we can find roo n and leisure .- We understand it is from the able pen of Jonn B. Davis, Esq. of this city.

COLD WEATHER.

[Extract of a letter from a gentleman, dated Johnstown, N. Y. Jan. 21, 1831, to the Editor of the N. E. Farmer.]

While writing this, the thermometer stands (exposed on the north side of the building) at twentytwo degrees below zero! Alas for my Altheas-French Tamarisks, Chorchorus Japonica and Magnolias. This is much the greatest degree of cold experienced here for many years past; and heretofore I have not been able to keep any of the above plants from freezing to the ground. Is there no variety of the Althea that will withstand the winter here? If so I should like to know it,

We beg leave to call the attention of our readers in the Western states to the advertisement of Mr. Parkhurst in this week's New England Farmer, believing that he has begun an Establishment that will result in great and permanent advantage to their interests. He is thoroughly acquainted with the business which he has now commenced at Cincinnati; and we happen to know that he has taken out with him one of the most extensive and valuable assortments of Seeds and Agricultural Implements ever shipped from Boston; comprising all the most esteemed and early varieties of vegetables and valuable grasses; and all the improvements in the construction of ploughs, hoes, and other implements of daily use with the farmer, that Yankee ingenuity has yet suggested.

PERFUMING THE ATMOSPHERE.

The conductors of the Gardener's Magazine observe that whoever has walked in the orange orchards at Nervi, knows that the quantity of orange trees distributed in the Garden of the Tuilleries if allowed to retain and expand their blossoms would scent not only the air of the garden but of half Paris. If there are any who deny this, we ask them to account for the orange fragrance of the air for miles around Genoa and Naples, both by sea and land. If all the public gardens in Paris were moderately stocked with orange trees and a less than was expected two weeks ago. Other acfew distributed along the Boulevards (and the counts correspond with this.

Parisian populace are sufficiently cultivated not to touch either the blossoms or the fruit of trees thus confided to their care for their advantage) the entire atmosphere would be that of the Island of the transplantation of a tree of large dimensions St Michael: nor would this perfuming en masse surpass other improvements of the age; lighting by gas for example. By the judicious distribution of orange trees, and of other odoriferous flowers the picturesque domains of Chatsworth, where hi shrubs and plants, or even by mignionette alone, the air of any city might be rendered as odor-ferous as that of a garden. When the many have once conquered from the few what is necessary and convenient, they will then attempt what is agreeable and refined; and with the knowledge of the wonderful resources of nature and art, requisite to give them the sovereignty of society they will succeed.

CHINESE COW.

An English publication states that 'a Chinese cow, now in England gives milk so very rich, that one pint of it gives as much butter, (4 ounces) as 7 pints of a Sussex cow's milk, both churned immediately from the cow without being set for cream. The Chinese cow is small and, says Mr. Young, the beef is superior in fatness, and in butter the superiority is as 1400 lbs, to 200 lbs, from a very good country cow.' This is such a superiority in milk and beef as might make it an object to the owners of American ships to China, to import some of the stock which is native to that country.

GARDENS.

Mankind at the creation were placed in a garden planted 'eastward in Eden,' containing not only what was 'good for food,' but 'every tree that is pleasant to the sight'-a garden therefore seems to be peculiarly adapted for the pure in taste and innocent in life. It has been the favorite task of the highest poets to describe paradise; and even the least poetical of mankind retain so much from the wreck of a better nature as to preserve a love for gardens. The taste is manifested in various ways, and he whose heritage includes no glebe, has his plants in a vase, which are tended with care, that he may have

'A peep at nature, if he can no more.'

With a few exceptions, cities the most distinguished for refinement give the greatest support to the cultivation of gardens; yet there is none open to the public (except the small one at Cambridge) in the vicinity of Beston. If a person would devote a hundred acres or less, within a short distance of the city, to an ornamental garden shaded with our best fruit trees and the hardy foreign plants, with a green house for such exotics as shrink from frost-if the garden were diversified with wood, and lawn, and water, it would be to the proprietor a better estate than ships or spindles. The nursery department alone would give a profit, which however would be the least of the gains were the place made really attractive. The man who will do this will gratify two tastes at once; one founded on the principle that leads men to seek their own interest, and the other on that which gives them pleasure to do a kindness and a service to others.-Tribune.

Λ letter from New Orleans, dated 29th Dec. states-'We have had a frost here which will cut off the crop of sugars one fourth, say 20,000 hhds.

TRANSPLANTING.

An experiment of a novel and extraordinar description was undertaken at Derby last week, i the Weeping Ash, which has so long been the ad miration of the public. This beautiful tree ha been removed without sustaining any damage, t Grace the Duke of Devonshire has selected a mos appropriate situation for it in the north front of his princely mansion. On wresting up the tre with the well-adapted and powerful machine ap plied for the purpose, it is calculated that the re sistance of about fourteen tons of soil, in which it widely spreading roots were embedded, was to he overcome. The weight of the tree in the star in which it has been conveyed, a distance of twen tyeight miles, to its present situation, is understood to be from seven to eight tons. One of the root drawn up had extended itself more than twenty eight feet from the bole of the tree.

THE CHOLERA MORBUS.

This fatal epidemie, having ravaged a large por tion of Asia, is fast spreading into Europe .- Fear are entertained, and not without reason, that it may extend to America, Providence seems to have di recte I that the human race, at stated periods, should be visited with pestilence. The cholera morbu may succeed to the office of the plague and the small pox,-Whether this disease be contagiou or not is disputed, and is of little moment : for cer tain it is that it has been propagated by the move ment of large bodies of men from the infected dis tricts into those whence it had been unknown If Russia should prosecute a war against France the pestilence which she will carry into wester Europe, will be more terrible than her arms; and will, perhaps, greatly facilitate her designs of con quest. The following account of the progress of the cholera morbus is from the late French papers

Cholera Morbus .- At a meeting of the French Institute, communications from various parts o the Russian Empire were made by M. Moreat de Joannes, on the progress which the Cholen Morbus has made in that empire, to which M. dt Humboldt added some very enrious facts, he had obtained during his recent travels in Asiatic Russia his statement began with its first appearance in the Bombay army, in 1818, from whence in 1819. it spread to the Isle of France and Madagascar. In 1821 it appeared at Bussorah, from whence it spread by the Euphrates to Syria ; it diminished in violence for three years, although it spread along nearly the whole of the northern coasts of Africa. In 1823 it appeared on the borders of the Caspian Sea, and made dreadful ravages at Astracan, spreading from thence into Central Asia, whence it was supposed to have been brought by the caravans, which generally consist of three or four thousand men and camels, but this supposition, M. de Humboldt proves by facts, could not have been the case. In 1829 it broke out on the Persian frontiers of the Russian Empire, from whence it spread into Georgia, where in one city of 30,000 inhabitants only 8,000 escaped.

On the 31st July, 1830, it again appeared at As tracan, where 21, 000 persons died, from whence it extended into the country of the Don Cossacks, and arrived at Moscow, having spread over 46,500 square leagues of country. The official bulletin published at Moscow states, that from the 28th September to the 11th October, one in three of

FROM TO

those attacted died. It is also stated, that it s recently appeared in the neighborhood of Conntinople : it was at O.Jessa on the iSth October, m whence it is feared it will gain Greece, Italy, I the southern parts of France, though its effects suspended by the winter. The Institute depated the present conduct of Russia in marchlarge bodies of troops from countries infected th it to countries that are not, and more escially, as it is historically known, that it first apared and was propagated in India by Lord Hasgs' army. - N. E. Palladium.

Elsineur, Nov. 25,—The epidemic which has evailed in different parts of Russia still contins; and a very alarming circumstance is, that ien its course is supposed to have been arrested one point, it sometimes appears at the distance from 30 to 80 German miles, passing over the mediate country without affecting it. A post tich recently arrived from Moscow reported 300 w cases which had appeared in one day; and 00 appeared on the last day of which we have ounts by another post. The thermometer has m at 15 degs, below zero at Gefle in Sweden : I, of course, in Russia also the weather must ebeen very cold; yet the disease is not checked. e Imperial Court at St Petersburgh, were preed to retreat, in case of danger, to Wiburg in land, ..., V. Y. D. Adv.

I further certify the trimfor a suit of curtains now in the house of Hon. I Webster, of Boston, was made of raw silk raised eled by said Jonathan H. Cobb.

EDWARD BROWN.

Agricultural Warehouse and Seed Store,

CINCINNALI, OHIO.

The subscriber respectfully informs the Farmers and Planters of the Western States, that he has just arrived in this city from Boston, with a large and general assortment of AGRICULTURAL IMPLEMENTS of the most approved kinds; with also a general and very extensive assortment of Grass, Garden, Field, Flower and HERB SEEDS, which will be found to comprise a larger variety than has ever before been introduced into the Western country.

The above articles have been recently purchased from the well known Agricultural Establishment of Messrs NEWELL and RUSSELL, in Boston, and were selected by the subscriber himself, (who has been for several years engaged in the business) with great care. Those who may call at his Agricultural Warehouse, No. 23, Lower Market street, between Sycamore and Main streets, will be assured of finding every article wanted in the agricultural line, of a superior quality and at tair prices.
S. C. PARKHURST.

Cincinnati, Jan. 1831.

Situation Wanted.

A man who has served a regular apprenticeship to the farming business in Europe, and is acquainted with all its branches, as breeding stock, &c, transplanting trees, grafting, budding, &c, is desirous of procuring an eligible situation on a farm. He would not object to going to any part of the Umted States, if required. He will show the best recommendations. Address J. B. Russell, post paid. Unless a first rate situation should offer, it will be no object to the advertiser to embrace it.

Silk Coroons Wanted.

I will give eash for Cocoons, from 30 to 50 cents per J. 11. COBB. pound, according to quality. Dedham, Mass. Jan. 25, 1831.

Farm to Let.

To be leased for the term of five years, or less, a small Farm in Andover, and within four miles of Lowell. A good place for the raising of vegetables for the Lowell HOBART CLARK. Market. Inquire of Andover, Jan. 15, 1831. Jan. 21. 6t

Black Current Wine.

For sale at the Agricultural Warehouse, 52 North Market Street-

A few dozen bottles of superior old Black Currant Wine, made by a gentleman in this vicinity; an account of its astringent and detergent properties in various com-plaints, and particularly the Sore Throat, will be found in the New England Farmer, vol. v. page 567, written by Samuel W. Pomeroy, Esq. and the late Dr John G Coffin. Price 75 cts, per bottle-also, a few bottles of old White Dutch Currant Wine, price 50 cts. per bottle. Dec. 31.

.Immunition 3

Of the best quality and lowest prices, for sporting—constantly for sale at COPELAND'S POWDER STORE. 65 Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be refunded. If Jan. 7.

Bolivar Calves and Saxony Bucks.

For sale, 4 Bull Calves, sived by the celebrated imported improved Durham short horned bull Bolivar, which stock have produced 36 quarts of milk a day. No. 1, dam Grey Brown, half Codelis and half Galloway. No. 2, dam Juno, three fourths Fill Pail. No. 3, dam Ceres, her sire Colebs, her dain Mr Gray's imported Cow. No. 4, dam Beauty, half Colebs and half Galloway. The Calves are beautiful, and their dams all great milkers.

Two imported Saxony Bucks, 2 Yearlings, and 2 Lambs, Inquire of Benjamin Shurtleff, Jr, Chelsea, or at 52 Hanover Street, Boston.

July 9.

Farmer Wanted.

Wanted a Farmer, with a wife, without children, the one perfectly acquainted with the business and capable of taking the management of the Farm, and the other fully competent to take charge of the Dairy; none need apply without the best recommendation. Address the Publisher of the New England Farmer, Mr John B. Russell, post paid.

Also wanted, one or two Milch Cows, extraordinary milkers, handsome, and not exceeding 4 or 5 years old, for which a generous price will be given. Apply as above, post paid. No application need be made except I for very superior animals. 6t Jan. 28.

BRIGHTON MARKET-Monday, Jan. 31. [Reported for the Chronicle and Patriot.]

At Market this day, 521 Cattle, (about 60 of which were stores,) 1130 Sheep, and 354 Swine ;-all the Swine and 160 Sheep have been before reported.

Prices.—Beef Cattle—No material variation from last week-we shall quote from \$3,75 to 4,67-as is usual, a tew prime cattle were taken at \$5.

Barrelling Cattle-Mess, \$3,50, a 3,621. No. 1, 3 17

Sheep- We do not recollect having before noticed so many prime Sheep at market in one day—sales quick; we noticed one lot of 45 taken at \$1, a lot of 80 at \$5, a lot of 100 at \$5, and a lot at \$6-quite a number, say 50 or 60, were Cossets, and would have brought 7 or \$8 each, had they been sold separately-we noticed one at \$12, and 3 at 8 33 each. Swine-Sales brisk at retail, at 5 cents for Sows and 6

for Barrows.

New York Cattle Market, Jan. 25 .- At market 400 head of Beel Cattle and a very inconsiderable number of Sheep, say from 2 to 300, owing to the bad state of the roads-market for Beef good, and all sold. A few extra Cattle taken at \$7.50, several lots good at 64 a 65, several do, fur 5½ a 5¾ and ordinary \$1¾ a 5 per cwt.

Sheep—sale quick and prices high, extra, \$6, good 4\frac{1}{2} 5, tair 3 a 3\frac{1}{2}, ordinary 2 a 2.50 each.

Milch Cows, a few sales at 25 to \$30.

Pork, in hogs, prime 54 a 62 cents.

Hay very scarce and now selling at 87% a 1,12%.

MISCELLANY.

MOONLIGHT.

When the fair moon, refulgent lamp of night, O'er heaven's clear azure spreads her sacred light; When not a breath disturbs the deep serene, And not a cloud o'ereasts the solemn scene; Around her throne the vivid planets roll, And stars unnumbered gild the glowing pole, O'er the dark trees a yellower verdure shed, And tip with silver every mountain's head; Then shine the vales, the rocks in prospect rise. A flood of glory bursts from all the skies; The conscious swains, rejoicing in the sight, Eye the blue vault, and bless the sacred light.

FROM THE DESK OF POOR ROBERT THE SCRIBE. Though now so cheap, the thing, I fear, Will prove abommable dear.

There is a wonderful magic in the word CHEAP. The news that a merchant has got some articles very low, sets a whole neighborhood agog. No matter whether the thing is wanted or not, it must be bought. And the worth of many a good plantation is squandered in the purchase of things, useless as the fifth wheel to a coach, merely because they are cheap.

My aunt Eunice, whose wisdom is of the best often to warn us of the folly of buying things because they were cheap. In her younger days it was her province to tend the dairy, and every fifth cheese was her wn perquisite. She had got an measure, on their education and early habits. hundred weight, and to market she went with her cheese, intending with the avails to lay in some little necessary articles against an emergency.

New York from Applebury lies S. S. W. two days' journey when the roads are good. Aunt Eunice had never been to the city before, but had often heard of the amazing cheapness of things there. Her cheese yielded her, in silver money, two offers to teach your children cheap, suspect him. and 20 Combill. pounds ten shillings, to a farthing. Who so happy as she? Methinks I see her now, tripping along Broadway - her cheeks ruddier than a Pearmain-her hair dressed in the fashion of those days, with a high commode, a little on one side, looking so jaunty. Then her stays were laced anusually tight, showing a waist slender as the cream churn -her stockings were of her own knitting and whiter than the hily; and her high-heeled shoes gave her an air of lightness and majesty. As memory rolls back the wheels of time, and opens to my ken the scenes of youth, other objects, in mingled light and shade, rise to my view. I see, all glowing with health and beauty, the smile of one, whose smile was life and love. The song that cheered my boyhood, reverberates on memory's ear. But the form of beauty is lost in darkness, and her voice is hushed in the tomb. There, snow last night, we understand that the Rail Road too, beloved Aunt, and thon, Old Robert, must ere long mingle your dust with hers-and your hearts, to the Mills this morning at 9 o'clock as usual, all descriptions of Printing can be executed to meet t that still beat so cheerily, become still and cold as the clods of the valley. Ye who have loved * * but whither do I wander.

From shop to shop my Aunt roved. A new thimble-bright as silver-cost but sixpence, and limore paper, Jan. 10. she bought it. Fans, ribbons, laces, trinkets and gew-gaws, which her judgment did not approve, she still purchased, because they came so very low, the table, care should be taken that the feet and When a little tired of running, and satiated with being young; the legs of old geese are red. If Portsmooth X. H. J. W. FOSTER, Bookseller, novelties, she returned to been hadring and novelties, she returned to her lodgings and sat recently killed, the legs will be pliable, but if stale down to count her cash. How great was her dis-they will generally be found dry and stiff.

appointment, to find more than three fourths of it squandered on things of no value? Poor girl! she could not purchase half the articles she had deemed indispensable!

She would sometimes tell the story herself, but did not like very well to be told of it. But being half in love, and having of course an itch for scrib-

from which my motto is extracted,

When I see men having their business and crowding to a VENDIE, when there is not a single article to be sold they really want; but wasting their time, in drinking and bidding, because things go cheap-

When I see a young woman changing her tow cloth for a parasol instead of a petticoat, or six dollar bonnet instead of a bed-tick, I would give a pinch of my best Rappee if some kind friend would whisper her-

Though now so cheap the thing, I tear, Will, in the end, prove monstrous dear.

But of all chear things that in the end prove DEAR, Razors and SCHOOL MASTERS are the most aborainable. One will mangle your flesh, the other will mangle the education and morals of your children. In too many neighborhoods, the price, and not the qualifications of a master, is looked at. For the difference of three dollars a kind, for it is the wisdom of experience, used month, a man of sense and learning will be disment struction in that capacity. He is a single man. placed, to make way for a booby.

> Listen to old Robert. The future usefulness and destiny of your children depend, in a great Their education and their morals depend greatly on their tutors. If their master be illiterate and vicious, how can be impart knowledge and virtue to your children? A man of learning will notcannot devote his time and talents for little or different authors. And an Addenda, containing the ann nothing. No man deserves a liberal support better than a school master. When, therefore, a man A child will learn more in one quarter at a good, than in two at a poor school. It is cheaper, therefore, in the end, to have a good school master at twentyfive dollars a month, than a poor one at fifteen dollars, for you save half the time. - Wilkesbarre Gleaner.

The amount of transportation during the last summer on the Blackstone Canal from Providence to Worcester and other places situated on the canal, was 9317 tons, and the transportation to Providence from Worcester and other places described was 5403, making a total of 14720 tons. The amount of tolls received in the year was 12,-006 dollars.

Rail Road.-Notwithstanding the heavy fall of Carriages, proceeded by a snow scraper, went up and also conveyed the passengers for Washington as far as the half way house. This is another proof, Market Street. if any were wanting, that a fall of snow presents no interruption to travelling on Rail Roads.—Bal-

COMMANTON TAOMS'

FOR THE NEW INGLAND FARMER.

FARMING OPERATIONS.

Mr Epiron-1 am a friend to practical, scientifarming, and regard the exertions of the prent day, to raise the tone of agricultural improveent in our country, as ominous of good; and ch men as Lowell, Welles, Dearrorn, Prince d others, who are disinterestedly devoting their ents and wealth to the promotion of an object so much importance, deserve the respect and atitude of the whole community. But notwithinding the happy effect and satisfactory results the efforts and examples of such men, it can rdly be expected that all, or even a majority of r country farmers, can adopt the same system d comse of procedure. There are many who ssess indement, taste and inclination, sufficient render them preeminent, in the profession, but ng destitute of the necessary pecuniary resourcthey are obliged to pursue a course which will ver enable them to distinguish themselves as y would, were they placed in more favorable sumstances. They are obliged to labor all their 's, pursuing their business early and late, pracig the best economy, in order to render themes and their families comfortable, and mainthat state of independence in life, which alst every one has a natural desire and propensio enjoy. They find it impracticable under exig circumstances, to put their farms under that of cultivation, and make those improvements eon, as would be desirable, and which in y instances, characterize those in more opulent

unstances.

it not a fact, that in most cases where we with a farm under extraordinary managet, being in all respects one of the first order as a condition, that its owner is a man of wealth, usive of his farm, always having a surplus ioney at command, which may be appropriate any time, to effect any purpose, or promote

object desirable. a new fence or building of any description is sary, it can be erected immediately, in the finished and perfect manner, without producie least inconvenience. If an extraordinary all is wanted at any time for the purpose of oving the stock on the farm, it can be purchasost what it may, Should any portion of the be literally a barren waste, being proof st all ordinary methods of cultivation, it is red feasible and productive by the applicaof extraordinary means, and perhaps in the becomes the most valuable part of the farm. yord, no labor or expense is spared which be necessary to put everything in the best ion imaginable. All this may be right and endable, as it may and probable will be proe of beneficial and wholesome effects. But ver pleasing it is to see things managed in ay, however desirable it may be to have all rms brought into such a condition, and therendered vastly more productive than they re, it is unwarrantable to expect that that f farmers who earn their bread by the sweat __EDITOR.

of their brow, or in other words, raise themselves entirely by their own efforts, can adopt the same course, or effect that improvement in agriculture, which is the case with that class of men who by their laudable enterprise and unremitting zeal, are showing to the world what valuable results may be produced by an application of those means which the good hand of Providence has so abundantly bestowed upon them.

Although many of our farmers may be unable to attain to the degree of eminence in the profession, to which some others in more favored eircumstances have arrived, it by no means proves that they have made the progress which they might have done, even in the less favored situation in which they are placed. As the present is emphatically an age of improvement, it becomes every farmer, however unfavorable his situation and circumstances may be, to set his aims high, and make every possible advance that may be within his power.

It is undoubtedly the case that many of our farms which are now considered to be under tolerable good management, might be rendered much more productive, without the application of any more labor or expense, were things managed in a different manner.

Much depends on a judicious and proper application of means, and although the less opulent farmer may not be able to accomplish everything at once, yet by pursuing a right course, together with industry and perseverance, he may produce effects, that will claim the notice and attention of every beholder.

A COUNTRYMAN.

FOR THE NEW ENGLAND FARMER.

RECLAIMING LANDS.

Ma Fessenber—In the New England Farmer, vol. vii. page 234, is a communication signed R. and dated at Southington, Conn.; at the close of which, the writer notices the subject of reclaimed lands.

He observes that the 'plans he has been led to adopt, he has never seen mentioned, or adverted to, in the various articles on this subject which have appeared in your columns, and that these plans have uniformly led to the most perfect and gratifying results.'

'At a moment of more leisure' he adds, 'I will endeavor to enter into detail upon this subject.'

Now, Sir, as I reside in a region where the soil in general has been reduced by unskilful cultivation, any new ideas on the subject of restoring ist fertility would to me, be particularly interesting.

If your correspondent will have the goodness to communicate his ideas on this subject through the medium of your paper, he will probably render an important service to the cause of Agricultural improvement, and greatly oblige at least one of your readers.

Granby, Conn. Jan. 31, 1831.

We hope our correspondent 'R.' will comply with this request, and favor us with the details and results of his experiments in 'Reclaiming Land.'—Epitos.

FOR THE NEW ENGLAND FARMER.

SALT HAY.

MR EDITOR-I have read with some interest the inquiry of your Duxbury correspondent, and the reply of 'Vicinus,' on 'Salt Hay,' and must take the liberty to differ from both .- In the first place I think your Duxbury correspondent underrates it; and in the next place, I think 'Vicinus' quits overrates it, and is vastly mistaken in his opinion. notwithstanding his experimental theory; I trust on careful investigation he will acknowledge himself in an error. I will give him full credit for his skilful management of his meadows in ditching. &c, and for his method of curing his hay, and will likewise admit that salt hay (well cured) and put under cover, is good fodder, and that working cattle, young stock and sheep may be kept tolerably well on it through the winter; but to milch cows or horses it should be dealt out sparingly; (unless to heavy or broken winded horses) it is a fact well known, and universally acknowledged, that to keep milch cows altogether on salt hay will nearly ruin them for milk; a handful given occasionally is beneficial-but I give it as my opinion that cows kept constantly on the best of salt hay, will not yield half as much milk as if kept on English. In fact I should prefer good fresh meadow hay for them.

*Vicinus' has a very accomodating set of customers that give him as much for sult hay as for English; in this part of the country there is a considerable staging, and although good salt hay is sold at about half the price of English; yet the proprietors of the stages very seldom purchase any for their Lors.c; and the large owners of salt meadow are quite willing to exchange it pound for pound for fresh meadow hay.

It 'Vicinus' has been a resident in the Old Colony so long, he should not have insinuated the want of method in the farmers in his adopted Colony.—I have resided about as long in the Old Colony and have visited much of this state and several of the states in the Union, and I can bear with set that there are some as good practical farmers in the Old Colony as in any other part I have ever visited.

I think there are many who have a good method of farming, yet I trust but few who prepr Salt Marsh to good English meadow.

January, 31, 1831. SCHOOSETT.

FLAX.

There is no article which is the roduce of our farms, over which foreign interest and ignorance have held such undisputed swy, as in the cultivation and preparation of Fle. During the years of 1821-2-3, there seemed a disposition on the part of our government to neourage the growth and manufacture of this ricele; since that time we hear very little abov. it, and at this time a domestic manufactured hen shirt is as rare 18 a white colt, and the dist f and wheel will soon be reckoned by our youn ladies as instrument belonging only to the $\frac{1}{2}$ of chivalry.

There are several pinions with regard o flax, prevailing among u which are incorrect.

First-That the climate and soil of the Uni-

growth of flax.

Second-That flax which has been allowed to stand until the seed was ripe, is not capable of prepared for the finest of lace; and I would here obbeing manufactured into fine cloth.

Third-That flax is not capable of being spun by machinery.

Fourth-That spreading flax upon the ground and dew rotting it, is the cheapest and best method.

Now we shall attempt, from our own observations, and the authority of others, to show these opinions incorrect.

As regards the quantity of flax produced per acre in Ireland, Marshall, in his report to the Linen and Hempen Board, in 1817, gives the average quantity at 500 lbs. In receiving this estimate, and comparing it with the produce of our own soil, we must make allowance for the difference in acres, the mane, and from the shoulder almost to the car. between the Irish and American; also, that their flax is water-rotted by which it will give about twentyfive per cent more than when dew-rotted, for which see report from the Secretary of the Navy, transmitted to the Senate of the United States, January 5th, 1825, and republished 1830. In addition to this difference, flax does not waste as much in cleaning, by the Irish process, as by ours, as they merely free it from the woody part of the stalk, leaving it to be made fine by what they term dressing, which is the same as we call hatcheling. Now by looking into the records of our agricultural societies, we find that the produce of flax offered for premiums, was considerably above Mr Marshall's estimate for Ireland. In the Ploughboy, vol. 2d, page 188, we find that the first premium was given on 772 lbs. per acre, and at page 179, a premium awarded on 619 lbs. per acre. Now, if we add to these crops fifty per cent for the difference in measure and in rotting and cleaning, we have the produce of 1040 lbs, per acre. Our own opinions are, that we have seen finer flax grown in America, than we ever saw in Ireland; but do not think our land and climate \ are generally as good as theirs.

The second erroneous opinion is, that flax that is allowed to ripen seed, is not fit for fine cloth. This point the Linen and Hempen Board of Ire-

land have put at rest. Haring been convinced of the superiority of the Dutel flax over the Irish, in 1822 they sent Peter Besnald, Esq. Inspector General for Leinster, Munstel and Connaught, into the Netherlands, in order to asertain the reasons for the superiority of of the Dutch flax. In his report he says-

Why so general an opinion as has prevailed in Ireland, for a series of years, that flax which gives seel is not adapted for her fine linens, should have takn place, I cannot conjecture.' Again, speaking of a establishment at Antwerp, he says, · I called at he manufactory and purchased a small quantity of the yarn, for the inspection of the Honorable bord, and which is sold at the rate of £47,786 13s. a. per ton. The yarn which I jurchased, is not " the finest kind, but I have every reason to suppore, from the inquiries I made, that it was spun from flax that had given seed.' We have had some yarifrom Valenciennes, which was much finer than the alluded to above, which was nade from flax whic ripened seed.

As to the generally received opinion, that flax cannot be spun by mach cry, it is ridiculous. The marlinery is not as compleated, nor as costly, as for spinning cotton. But w-rotted flax is not worth manufacturing, when to to which is water-

we propose to give the Dutch method of managing their flax, from the time of pulling, until it is serve, that a female might work one year on one or two lbs, of flax to advantage .- Genesie Farmer,

FOR THE NEW ENGLAND FARMER.

HORSES.

MR EDITOR-About four weeks since, I rode a young horse about seventy miles; the travelling was bad and it rained severely most of the time. The horse was not over-driven. I stopped a week. In returning, after I had ridden about 40 miles, I got off to walk up a hill, and when I was about to remount I discovered a swelling on one side of the borse's neck extending from the windpipe to The swelling was hard and the neck was increased at least one third in size. The horse travelled as well as before, and appeared free from painbreathed well, and when I put up ate well, - Since that time the swelling of the neck has measurably subsided, and a soft swelling has appeared upon the side of the belly, of the size of a man's arm, and has now extended to the hind legs. The animal still cats well, his eyes are bright, and he is evidently free from pain-but what the matter is with him, what occasioned the swelling, or how to cure the animal I know not. I have kept him warm, warmed his drink, physicked him, and bathed the part affected in camphorated spirits, but still he is not cured. Will you or some of your correspondents inform me through the New England Farmer, of the cause, nature and remedy of the animal's disorder? Yours,

Vassalboro', Me. Feb. 5, 1831.

We hope our Portsmouth correspondent will favor us with an answer to the above. - ED.

FOR THE NEW ENGLAND FARMER

IMPORTANCE OF CORRECT NAMES.

MR EDITOR-It would contribute much to the value of the New England Farmer abroad to have the botanical names of the plants spoken of appended to them-the local name answering merely for a neighborhood. Your distant subscribers lose much where no others are given.

In the last number, under the article Salt grass or Salt Hay, I should be pleased to be informed what the Goose grass, there spoken of is - with us the (Polygonum aviculare) bears that name; also the Fox grass; -the English hay or English grass; with us (Agropyron or Triticum repens) bears that name; the Polypod or mount royal, and in joint—the Flat grass.

It would be very interesting to us at a distance to know all your grasses by their local names,-1 would therefore suggest that some of your correspondents should give us through the medium of it may be done, averaging the losses. This me the New England Farmer, the names of all the grasses common to your district, both the common and the botanical. By so doing he will much oblige an INQUIRER.

Philadelphia, Feb. 4, 1831.

N. B. What is the botanical name of what you bandry. call red top?

Red top and White top, the Herd's grass of the Southern States are varieties of Agrostis stricta. -

We hope MR NUTTALL, or some others of our

ted States are not calculated to produce a good rotted can be procured. As the season approaches competent correspondents, will furnish an answer to the inquiries of our friend in Philadelphia.

TOP DRESSING GRASS GROUNDS, &c.

By top dressing, much of the best properties o the putrescent manures are exhaled or wasted in the way that has been described; if to this be add ed the too general loss sustained by decomposition before the manure is applied, it will be found that but little good can be done by a great deal of it when used in this way.

If dung be used for top dressing, it should b applied soon after the first crop of grass has been mown, and before the manure has suffered any ma terial loss by fermentation. The grasses shoulbe suffered to grow until they form a close shade after this, they may be pastured, provided a goo covering of them be preserved. This will pre vent much exhalation; it will also keep the so much more open to receive the juices of the me nure. As water does not pass off so freely throug a close pile of grass, much of the coarser particle of the washings from the manure will be arreste in their progress through it, and much more c the inices from the dung will sink into the soil The close covering also greatly favors the deconposition of the litter, and by keeping it flexible causes it to sink further into the soil, and li much closer to it; therefore but little if any of will be found in the way of mowing the ensuin crop of grass, or of making it into hay, provide the manure be very evenly spread over the ground But as the want of the second crop for hay and othe circumstances, may readily prevent the cultivate from hadling the dung at the proper time, he ma hand and spread it any time before frost sets it but not with the same advantage. Still, if car be taken in raking up the hay of the ensuing crop but little of the litter will appear among it.

Top dressing, however, with putrescent m nures, is, under the most favorable circumstance a very wasteful practice, and should be avoide where population is sufficient to admit the pra tice of convertible husbandry; except by the who prefer the case obtained by grazing excl sively, to a more active and much more profitab

mode of management.

When ashes, gypsum, lime, &c, are applied . the grass grounds, it must be by top dressing But either of these substances is more extensive useful to cultivated crops, when they are proper incorporated with the soil,

It is difficult to calculate the losses arising from the prevailing practices of gathering, preparing and using the manure that might be obtained from the general resources of a farm. Some manag the same No. Article Meadow Lands, the Blue better, and others worse. Neither weight no measure to ascertain these losses, can be referre to. We may, however, form a tolerable estimat

of their amount, by summing up the suppose losses arising from each improper practice, and, a centre between the best and worst practices i general use. I have done this, and believe the loss cannot be less than seven eights of the whole which might be very readily saved by good mer agement and a proper cultivation .- Lorain's Hu

HORTICULTURAL CURIOSITY.

We had the pleasure, a few days since, of n eciving a fine ripe Orange, from the garden of Di Kirtland, accompanied with the following note:

MESSRS HAPGOOD AND PEASE-Accompany

ng this letter is a mature and full grown. Orange, very slow, and they do not require the same quannaturity to the one I have forwarded to you,

Yours, with respect, Poland, Jun. 11, 1831.

LIVE OAK.

The Secretary of the Navy proposes to pandon the attempt made by the Government to tablish plantations of Live Oak. He supposes e Navy can never be in want of this timber, when is indigenous to the coast of the United States om the St Mary's to the Sabine ; and does not receive the necessity of cultivating it from the form. We are not prepared to speak with cernty upon this subject, but it is one of first imrtance, and much caution and investigation ould be exercised before the policy already adoptis abandoned. The Live Oak, if we mistake t, is found to the North of the St Mary's, but think Mr White, of Florida, who is opposed the Secretary's views, is correct, when he says ie Live Oak is found thinly scattered at most note distances, and in small bodies. If artificial lture be not resorted to, and the fires kept out the Reservations there will not be enough in y years, to build a West India squadron. e same authority declares there are 70,000 e oak trees upon the band purchased by the verument; which in a century or even a quarter. I be worth ten times the amount ever expended on them. ' The idea of planting Acorns for benefit of the Navy, has been sometimes ridied by those who do not remember how true it is t ' Large Oaks from little Acorus grow. ' The, nst venerable grove we have ever seen was of e Oak, the Acorus of which had been planted enty years ago. Whoever visits Bonaventure, r Savannah, will see that it is not impracticable sultivate plantations of these noble trees. And the woods of Florida, avenues of Live Oak found, planted, it is supposed, by a race long

e extinct; a race, civilized and industrious—of ose existence no evidences now remain-but scattered and worn implements of husbandry ad in the soil-the traces of roads, and these estic trees .- Georgia paper.

TO CONVEY LIVE FISH.

CURE FOR CONSUMPTION. MR HALSTED OUTDONE.

An English chemist of high fame, Mr John Murray, of Hull, F. S. A. &c, &c, has at length discovered what he firmly believes to be a cure for tubercular phthisis-for far-gone consumption. His work on this subject, which is dedicated to the Duke of Wellington, contains the result of twelve years' inquiry, during which period his thoughts have been exclusively bent to this noble and philanthropic object. In the progress of his investigations, he came to the very rational conclusion, and one which has impressed many other minds, that if any remedy should ever be found out for struetual disease of the hings, it must be some one which may be brought, through the medium of respiration, into immediate contact with the diseased surface; and, when there, have the power of subdning the morbid action, without diminishing the general tone of the system.

At length Mr Murray believes that he has discoved such a remedy in the vapor of nitric acid; and this fact is the more worthy of attention, since it comes from a source where empiricism cannot be suspected. Mr Murray is well known in the sientific world as author of some valuable works in Chemistry, and has, we believe, been himself a sufferer from the scourge he has striven so sedulously to avert,

We shall take some other occasion to afford our readers a more circumstantial account of this work of Mr M .- Bost. Med. & Surg. Jour.

Improvement in the Quality and Quantity of wood .- M. Montbret has presented a memoir to the Paris Academy of Sciences, on this subject. He states, that the nonrishing fluids are naturally distributed between the flesh, the fat, and wool of the sheep. He recommends frequent shearings when the animal is young, whereby these fluids are determined in greter abundance towards the skin. This increases the quantity and improves the quality of the wool.

To remove spots of grease, pitch or oil from woollen cloth .- In a pint of spring water dissolve an onnce of pure pearlash, adding to the solution a lemon eut in small sliees. This being properly mixed and kept in a warm state for two days, the whole must be strained and kept in a bottle for use. A little of this liquid poured on the stained part, is said instantaneously to remove all spots of grease, purpose. Although fish are fond of cold wa- pitch or oils, and the moment they disappear the yet when the temperature is reduced to 32 de-cloth is to be washed in clear water.—Glasgow Kerl daar met de wit kop?' (Yes, that old fellow

Internal Improvement .- By statements from official sources it appears that there have been expended by

the General Government on Works commenced \$3,732,659 56

Works not commenced and for which surveys and estimates have been made

Works projected and partially surveyed 51,200.000 00

\$104,248,740.71

18.311.072 15

The Legislature of New Jersey have passed several acts during their present session, and are about passing others, encouraging internal improvements by rail roads and canals.

The currency of the country, according to Mr Sanford's Report in the Senate of U.S. amounts to about 85 millions, consisting of 77 millions of bank notes, and 8 millions of coins.

53,000 tons of anthracite coal are said to be annually consumed in Philadelphia.

In Philadelphia, there were in 1830, forty fires damage \$111,997. Uninsured, \$65,306.

Iron Chimneys .- If our builders would use cast iron pipes (round or square) instead of making cumbrous, inefficient and insecure brick chimneys, would it not be an improvement in the art of building?-They would take up less room-be more secure against fire-would draw better, and could be so contrived as to be more easily cleansed, (if necessary) than the expensive, unsightly projections which encumber our rooms at present.

The directors of the Camden and Amboy Rail Road, have it in contemplation to lay a railway from Philadelphia to New York in the ensuing summer.

North Carolina Gold .- Of the gold coinage of the United States during the last year, the amount of \$466,000 was from the mines of North Caro-

The whole amount of money for the Pennsylvania Canals and Railroads, appropriated and placed at the disposal of the Canal Commissioners, up to the 10th of Dec. 1830, amounted to \$10,288,309 59.

Petrifuctions.-In the excavations for the railroad along the hills of the Mohawk valley, petrifactions, 30 feet below the surface, have been discovered. among them one of a human jaw bone.

The enormous bones which have lately been dug up at Big Bone Lick, Kentucky, continue to occupy the remarks of the Cincinnati editors. The animal is proved to have been 60 feet in length, 22 in height, and 12 across the hips. The upper bone of the head weighs 600 lbs. The grinders weigh II lbs. each. He was found in black mud 20 feet below the surface. These bones, of which the head and tusks are already in Cincinnati, are to be brought by the proprietor to New York, and thence to Europe.

Ardent Spirits.-The annual consumption of ardent spirits in Great Britain is stated to be 25,000,-000 gallons.

Manufactures in New York .- The annual value of cotton goods manufactured at the several establishments in N. Y. is estimated at more than \$3,000,000; of woollen, at \$3,120,000; of iron at \$4,000.

Challenging at the Cape of Good Hope .-- A Bushman prisoner being asked if he had any objections to any one of the Jury, looked round very gravely for some time, and then staring Mr Justice Menzies full in the face, and pointing to him said, very coolly and with much naiviete, 4a, de oude with the white head.)

REPORT ON LOCUST TREES.

The premiums on Locust Trees were first offered by the Society in 1824, to be awarded in 1830, upon the four best Plantations of one acre each. Three entries only are made,

The first, owned by Joseph G. Cogswell, Esq. of Northampton, contained trees of three years' growth, a part of which were in the nursery, and the remainder had been transplanted into an orchard. Those in the nursery were set very near together, and were generally in a flourishing condition. With the exception of a few on the outside of the nursery they appeared to be perfectly free from the borer. Those trees which had been transplanted were on lands which had subsequently been pastured with horned cattle, and had suffered much from the animals. The land was light and sandy, a poor pasture, the soil of which seemed to be greatly exhausted and worn down. For a more particular description of Mr Cogswell's plantation, manner of cultivation, &c, the Committee would refer to the excellent communication of Mr C, presented them at the time of their examination, not only as a directory for the cultivation of a few trees on the outside would be affected by the vellow Locust, but also as a valuable recom- this troublesome insect. mendation to the farmers of 'Old Hampshire' to cover their light and unproductive soils with a forest of the Locust.

The second plantation reviewed by the committee was owned by Mr William Clark, Jr, of Northampton. His trees were grown from the seed in a nursery and transplanted upon a piece of old and worn out pasture land, the soil of which was also light and sandy-too poor to admit of a regular cultivation with the plough. His trees have now been transplanted two years and are in a very thrifty and flourishing condition .- Much pains has been bestowed upon the orchard by training, prnning, &c, for which the owner is entitled to great credit. With one or two exceptions this erchard has been perfectly free from the rayages of the borer. The committee annex Mr Clark's statement of the history of his labors in the cultivation of the yellow Locust, from which many valuable hints may be gathered by future cultivators of this forest Tree.

The last plantation viewed by the Committee was owned by Daniel Stebbins, Esq. of Northampton. The seeds from which this plantation was

way old pastures which were worn out and ready - See New England Farmer, vol. in. page 147

on a rich soil.

posts made of the Yellow Locust have remained perfectly sound in the ground for forty years .-This being the fact it would evidently be a great acquisition, not only to the farmer for fencing tim-&c. It is also stated that in naval architecture the shipwrights use as much locust wood as they can procure, because it is as durable as the live oak and red cedar, with the advantage of being stronger than the one and lighter than the other.'

The only objection to plantations of the Locust, which has suggested itself to the Committee, is the danger of their being infested by the borer, 'a small winged insect (species of aphides) which attacks the tree while standing, penetrates through the bark into the centre of the trunk, and for the space of a foot, mines it in every direction, so that it is easily broken by the wind.' It is believed however that this insect only attacks the trunks of such trees as are exposed to the sun's rays, and if the trees in the nursery and in transplanting are set so near each other as to shade the ground, only

The Committee have awarded the premiums of the Society as follows:

1st Premium William Clark, Jr. \$30 Daniel Stebbins 25 Joseph G. Cogswell ROSWELL HUBBARD, JOSEPH STRONG, Committee. SAMUEL WELLS, JR. October, 13th, 1830.

Note.-The Essex Agricultural committee in the year 1824 in their report * say, * Barren and gravelly pastures may be covered with a good coat of grass by planting and permitting the growth of Locust trees-that care should be taken that horned cattle do not go upon the ground while the trees are young. The committee say that in addition to the gain of feed, the trees grow most rapidly, and no timber is in more demand or of greater value when arrived at maturity. It is doubted whether an acre of land can be made to yield more in the course of 25 or 30 years, without the application of manure, than by planting it with Locuet Trees.

To Messrs. Joseph Strong, Roswell Hubbard, and Samuel Wells, Jr. Esq'rs.

GENTLEMEN-I have no new or important facts to communicate on the subject of locust plantagrown were sowed in a nursery in May last, and tions, but as I have done something with them by by the careful and assiduous cultivation of the way of experiment, I beg leave to state to you the owner, the plants were sufficiently large to trans-result of the trial. In the spring of 1827, I proplant in October last, and when viewed by the Com- cured half of a lb. of the yellow locust seed, from mittee many of them were ten feet in height. All which I raised from two to three thousand trees: the trees in this plantation appeared healthy, flour-since that time I have twice planted an equal quanishing and perfectly free from the borer. This tity, and from the three plantings I have now nearly plantation is on a dry, sandy knoll-unproductive 10,000 trees. No preparation of the soil is necesand wholly useless for any of the ordinary purposes sary; that which seems hest adapted to them is a of cultivation. Dr Stebbins' statement is annexed, sandy loam. The seed should be soaked from 12 The subject of covering the light, sandy and un- to 24 hours in water poured on when scalding hot. productive soils which may be found on many of The young plant, which commonly show themselves the farms within the limits of this society will pro- within ten days after the seed is put into the bably be new to some of our farmers. It has how-ground, should be kept very clear of weeds, and ever for several years occupied the attention of in dry seasons watered frequently, until they are some of the most distinguished agriculturists in sufficiently large to shade the ground. I have now Massachusetts, not only as producing a wood valu- altogether more than two acres in this cultivation, able for fencing, ship timber and other uses, but partly in seed and nursery beds, and partly plantalso because a forest of the locust invariably coveled out. Although it is not yet time to reap any ers the land with a thick coating of grass. In this benefit from my locust plantations, I am satisfied

Hampshire, Hampden, and Franklin Agricultural to be abandoned have become renovated, and ap- that the light soil of our upland plains can be put pear with all the freshness and verdure of those to no better use than to grow these trees; they increase very rapidly, more so than any other tree It is stated upon good authority that fencing which we can cultivate here, and are not injured by worms when standing in a thick grove. I observe that the outside trees are frequently attacked, when no appearance of the insect is discovered on those in the body of the plantation, and have ber, but for railings for public walks-door yards, thought that the insect in its winged state does not enter where the clear light of the sun does not reach. As to the fact, I have no doubt that large and thick groves of locust suffer very little, but whether there is any truth in the above suggestion. I am not able to assert. To secure a flourishing plantation of this valuable tree, I believe nothing else is necessary but to select healthy trees of good size for planting out; to plant them near together, not exceeding four feet, and to keep cattle from the enclosure. With these precautions, in a few years, even on the lightest soils, my own experience convinces me, a thick forest will be formed, and by means of the shade, a fine grass sward spread upon a surface which would otherwise present scarce any appearance of verdure. The best proof that I can give of my confidence in the success of this cultivation is, that I am daily extending it, and propose to appropriate several acres to it the next season; at the same time, I shall give the white mulberries a fair trial, of which I have now about 10,000 plants raised from the seed this year. Respectfully, your obt. servt,

JOS. G. COGSWELL.

To the Committee appointed to examine and award Premiums on Locust Trees.

Gentlemen-My locust seeds were softened in warm water, and planted (in a sandy loam) about an inch deep, and two or three inches apart, in rows three and a half feet distant. The planting was done at leisure times, in the months of April and May, in 1828. The ground was occasionally hoed, and the plants kept clear of weeds through the season. The height of the trees in the fall would average about four feet, some of them were more than six,

In the spring of 1829, the small trees, (i. e. those which were overtopped by the more vigorous) were taken up and set about one foot apart in rows by themselves, for the purpose of supplying vacancies as they might occur in future. Those which remained in the original rows were pruned by taking off all the branches and heading down to where the wood was firm and well ripened. They were pruned again in July and August; all the young branches (of which there were an abundance) were shortened, excepting one straight leading shoot, which was carefully preserved. The ground was kept clear of weeds through the season, and some of the trees attained a height of more than twelve feet in eighteen months from the seed; the average height was about eight feet.

In November, 1829, eleven hundred trees were taken from the nursery and planted six and a half feet distant each way, on a piece of dry, gravelly, worn out pasture land, which was ploughed and harrowed for the purpose. (At the above distance 1032 trees will cover one acre.) At this planting the trees were divested of all their branches, and headed down as in the spring previous .- In the summer of 1830, the ground was hoed twice, and the trees pruned once. All of which is respectfully submitted to your consideration, by your WM. CLARK, JR. most obedient,

To the Committee appointed to view and award Pre-Barnitz, the intelligent inventor of a new process miums on Locust Trees.

f which vegetited. I then supposed the seed required. vas not good; but having stated my failure to gentter mode in my subsequent sowings in my places. ursery, and through fear of injuring the seed the hot water, did not steep long enough soften the seed, and of course lost many. In y first trial, without steeping, should think nine nths of the seed failed. In after trials, by parally steeping, about one third failed; but the prent year, by pouring over the seed boiling water, d steeping 48 hours in a warm place, I have suceded in saving perhaps nine tenths of the seeds. Last autumn (1829.) I transplanted about 1100 ints of one, two and three years' growth, and set er about three acres of land; some have failed; size was ordinary for the age, having been hoed, y occasionally just to subdue the weeds. But ise transplanted in 1830, on about one acre, re frequently been hoed, perhaps about once each ek, and the earth kept loose, and always when dew was on the ground. The soil was light not manured, but the plants are from one to feet each in height. They are set at a disce of about 4 to 5 feet each way. I have set on I parcel of land over 1200 trees, and contemplate ering several acres, say five to six, composed of and gravelly knolls.

All which is humbly submitted, by Tampshire Gaz. D. STERRINS

unflower Oil .- The American Farmer recomids the culture of the Sunflower for the sake soil, and states that the cultivation of the Suner differs in no respect from that of corn, the soil adapted to the latter is proper for ormer. The souflower thrives in all our vas climates. Under proper cultivation, and a medium soil it yields from 60 to 70 bushels to icre. The machinery for crushing and expresswill costabout \$300. One bushel of the seed yield about 3 quarts of cold, and one of pressed oil

The uses to which this oil is adapted are va-. It is equal to olive oil for table use, and rior in many important respects to sperm for s, while for paints and machinery it is well ted to supersede the oils now used in them. burning in lamps, the sunflower oil possesses Ivantage which has been an object of deep tude ever since sperm oil came into use-it to perceptible smell, hence sick persons and s, to whom the smell of sperm oil in lamps is fensive can use the sunflower oil with perreedom. Its advantages in this respect have fully tested in Philadelphia, where it is remended by some eminent physicians, and is in ant use by their patients. It has another rtant advantage over sperm oil—it affords tone third more light, that is sunflower will ne third longer than sperm, both while burnfording the same quantity of light.

Barnitz, of arden at the usual time of making it -only a few | York, Pa. will give any information that may be

The mass which remains after pressing out the emen residing in different parts of the U. States, oil is useful as feed for hogs and poning. This bund that before sowing some baked the seed, plant gives out great quantities of oxygen or vital thers steeped it in boiling water. I adopted the air, and it has been cultivated in unwholesome they have the ability to take several sleigh rides in

> To destroy Weevils among Corn,-Lay fleeces of wool, which have not been scoured, on the grain; the oily matter attracts the insects among the wool where they soon die, from what cause is not exactly known, M. B. C. Payrandeau related to the Philomathic Society of Paris, that his father had made the discovery in 1811, and had practised it on a large scale since .- Bull. des Sciences.

Butter.—The Journal des Connaissances Usuelles gives an account of the means used in the canton d'Isigny to procure excellent butter in Winter. The cows are warmly clothed, so as to cause them to calve in the autumn, as it is found that the milk after this process of nature at that time, becomes more abundant and richer quality; and during the severest weather in the winter, they were constantly kept clothed, and fed in the open air as the taste of the butter is said to be much injured by confinement in the stable. The butter of this district is superior to any other on the continent.

Dandelion Coffee .- ' Dr Harrison, of Edinburg, prefers dandelion coffee to that of Mecca; and many persons all over the Continent prefer a mixture of succery and coffee to coffee alone. Dig up the roots of dandelion, wash them well, but do not scrape them, dry them, cut them into the size of peas, and then roast them in an earthen pot, or coffee roaster of any kind. The great secret of good coffee is, to have it fresh burnt and fresh ground.

Honey Locust Beer-Recipe, - Take one bushel of honey locust seed and pods, when about ripe. break them, put them into a barrel, and fill it with boiling water; let it stand until milk warm, then add a pint of good yeast. Put in the hung lightly until fermentation is nearly over, then rack off, as with eider; when clear bottle it and wire the corks. When kept a few months it is equal to sparkling Champaigne. It can be used in two days after it is made. - Western Tiller.

The cultivation of trees .- 'Jock, when ye hae nothing else to do, ye should be aye sticking in a tree; it will be growing, Jock, when yere sleeping. My father told me sae, forty years since, but I ne'er found time to mind him.'-Heart of Mid Lothian ; the Laird of Dumbedike's dying address

Sir Walter has added the following note to the new edition of his novels. 'The author has been flattered by the assurance, that this naivee mode of recomending arboriculture (which was actually delivered in these very words, by a Highland Laird, while on his death hed, to his son,) had so much weight with a Scottish Earl, as to lead nt there is none of either. At present Mr to his planting a large tract of country.

A THRIVING TOWN

On this point we have some statistics of our own. We know a town, in size about the third rate in dollars and a half a month, and the elergyman is dismissed because the people are too poor to support him. This generation of paupers, gives an ample support to two dancing schools, each of which costs them, directly and incidentally, a thousand dollars. These thrifty people are of course too poor to paint their houses, or replace a glass broken in the windows, or a hinge on the doors; yet a winter, at the expense of two dollars each, and to call three times a day at the tavern, at the expense of six cents a time. It may be said that this is but one town, and an extreme case; but perhaps the reader may know many such towns, though it is hoped that he lives in a better.

How many towns in New England pay, collectively, one thousand dollars to support a tavern, that would not give fifty, to found a Lyceum. Yet where would be got the most instruction and rational amusement? Young men will pay five dollars at an assembly-a sum that would, for a year, pay more than their proportion to an institution, that would not only advance themselves in knowledge, but have an increasing hearing on the improvement of all the young in the community.

Has not the reader himself, honest man as he is, sometimes paid two dollars to ride on the sabbath, though he now feels too noor to give one to a Lyceum, for a course of intellectual pleasure and instruction,

This principle of ours is uniform and invariable. Economy never stands in the way of improvement, which is itself the best and most lasting thrift. There is no saving to be made in vice and ignorance. It will save money, and character, and crime, and punishment and remorse, to advance the moral and intellectual culture of our nature. This is the way to make us, indeed, lords of the lower creation, rising in intellectual dominion and perfection towards the Being who ordained it .-Jour, of Education.

Winter in Halifar .- Merchandise of all descriptions begins to arrive, and not the least singular in appearance are the wagon-loads of frozen pigs. These are exposed for sale, quite hard and stiff and in a fit state to keep till the spring. They had an unusually uncouth appearance; for their mouths were generally open, and the last services seemed never to have been properly paid to the defunct. Their limbs were not arranged with decent regularity and they appeared to have given up the ghost in the act of squalling and at full gallop. Some were placed standing at the doors in the streets like rocking-horses before toy-shops, upon their four legs, as if they had been alive. This mode of keeping a pig for a winter without giving him a grain of anything to eat, or being subject to his noisy, unmannerly conduct—nay, to be enabled to eat him piece-meal is indisputably one advantage of a cold climate. But frozen meat on the other hand, disappoints the epicure, being always tasteless

A. Moderate Salary .- We find by a document published in the Montreal Gazette that the salary of the Marquis De Vandreuil, Governor and Lieutenant General of Canada in 1758, under the French government was 3000 livres per annum, equal to £125 currency.

MEW EMBLAND PARMER.

BOSTON, WEDNESDAY EVENING, FEB. 9, 1831.

GARDENER'S WORK FOR FEBRUARY. If the weather should be sufficiently mild, you may carry manure into those places where it is needed, leave it in heaps without spreading. Wherever and whenever the snow is sufficiently off the ground, rake together and burn, or what is better, eart into your barn-yard, the haulm, withered stems of plants, or whatever may remain of last year's crop. Fences may now be inspected and repaired, and seeds rubbed out, cleaned, done healthy lambs, you will take good care of the ewes. man can saw as much and probably more wood in up in papers and labelled. Straw mats for hotbeds, poles, rails, lattices or trellises for espatier trees * should now be made ready for use. See that your garden tools are in good repair, and procure such new ones as may be necessary. Set about procuring and preparing materials for, and forming hot-beds. Clean trees from moss, and protect them against mice and rabbits by white washing with lime, or smearing with some composition which is offensive to those vermin. Enter in earnest into the business of forwarding various kinds of seedling plants, by artificial means, so that they may have strong roots and arrive at some size by the time they would naturally make their first appearance above ground. This may be done by sowing the seeds in small pots, and placing them in a hot bed. Attend to your fruit in your fruit-room or cellar, on shelves or in boxes, and if necessary pick it over, and cull out whatever is defective; wipe the remainder dry and pack it away anew. But if it is put down in some sort of grain, dry sand, flax-seed, chaff, or what probably is best of all, pulverized plaster of Paris, it may, perhaps, not require picking over. You may perhaps, towards the last of the month begin to force asparagus in hot beds, sow under glass cases for transplanting, or otherwise, radishes, carrots, small salads, peas, beans, &c. Protect small plants, which may show a disposition to vegetate, by matting, litter, cases of wicker, old bark, and other suitable means.

* Espalier rails are substitutes for walls, which they so far resemble that the trees are regularly spread and trained along them, are fully exposed to the light, and, having their branches fixed are less liable to be injured by high winds. They may be made of wood, cast iron, or wire and wood.

An espatier has this advantage over a wall tree, that, being wholly detached, the branches have liberty to form fruit spurs on both sides, which, in the wall trees cannot be effected but on one; in fact, common fruit walls are unnecessary in the United States, except in the Eastern, and some of the Middle States, where they are useful in forwarding to due perfection and flavor some late kinds of superior peaches, grapes and other late fruits; but when walls are built for other purposes, and are conveniently situated, advantage ought to be taken of them for raising fruit; observing to suit the various kinds to the various aspects, -M Mahon.

FARMER'S WORK FOR FEBRUARY.

Take this leisure time to select an I purchase such neat cattle, sheep, pigs, seed corn, seed wheat, potatoes for planting, &c, as will be likely to prove most valuable on your farm, having in mind the following maxim, viz. Choose those animals or vegetables to propagate from, that possess the qualities you wish might be possessed by their offspring in the greatest perfection. Our farmers are too apt to sell off their best stock to the butchers and keep the poorest to breed from and to gather their seeds from vegetables, which

were reserved for that purpose because they were of eight and twelve inches in length, as it is too worthless for the harvest.

ning wheels come somewhat nearer to perpetual which is dry, as a more steady and lasting fire will motion than some machines, which have been in- be produced than would be the case were the dry vented for that purpose. For every cent-saved in | wood used entirely by itself. A very consideradomestic manufactures you gain at least three ble saving may be realized by using the saw in cents. One cent you gain by the greater durability of the home spun article; one cent you save of cash not paid for the purchase, and one cent, are aware of the fact, baying never tried the exor perhaps, countless cents by bringing up your periment. A saw suitable for this business costs family to habits of thrift and industry.

For a few days or weeks before yearing time as turnips, potatoes, &r, that they may have more milk for their lambs : for it is the opinion of careful observers that want of milk is the cause of the dving of so many lambs in the first stages of their existence," * It has been recommended to give ewes about 3 a gill of Indian com a day each, till they have produced their young, in order to give them strength; and while suckling, good roots or some other juicy food. The Farmer's Manual says 'If you have stored more turnips than are sufficient for the use of the table, give them to any stock that will eat them, except your sheep; give to them notatoes, but not turnips at this season : they will injure the lambs. Weak lambs should be treated in all respects as if they had been drowned, and you would restore them to life. Apply gentle and regular warmth; give warm milk frequently in small quantities, (the milk of the sheep is best,) and if the ewe has sufficient for its support you may generally raise them, but if not they generally die. It is more work to murse one such lamb for 24 hours than to feed regularly 100 sheen for the same time. If your flock be large the wethers should be kept by themselves. They do not require so good keeping as ewes and young sheep.' The Farmer's Guide says 'If lambs are weak it is necessary to give them, the first day or two, a small quantity of cow's milk warm, three or four times in the day; if it is cold weather, the cup containing the milk should stand in another oats or white beans are given to sheep, during the winter, in small quantity, the lambs will be strong and the trouble of nursing saved,

ECONOMY IN THE USE OF FIRE-WOOD.

The following, from a respectable correspondent in Worcester County, has already been published in the New England Farmer, vol. v. page 223, and is here given for the benefit of those who have subscribed for our paper since that period,

Much depends on preparing wood for the fire, and much on the manner of using it after it is prepared .- to say nothing about the construction of fire places, and the advantages of using stoves. The method which from experience appears to me the best and most economical, is, during the winter to cut and haul a suitable quantity of wood, two 141 inch cables, one of them made of Riga which I saw into billets of two feet in length, hemp, and tarred in the common manner; the splitting it fine assorting it, and laving aside that other made of New Zealand flax saturated with a which is of inferior quality for use during the solution of gum, the invention of Capt, Geo. Harsummer, and piling the better part in my wood- ris, R. N. The hemp cable was broken, while

needed for the fire. I find it advantageous to use Dress out hemp and flax, and see that your spin- a considerable portion of green wood with tha s ead of the axe, in preparing wood for the fire although very few of our common country people no more than an axe, is as easily kept in order. Look well to your sheep. If you wish for fine and with careful usage will last many years, A the same time than he can cut with an axe, scarcely they should be generously fed. Some juicy food any litter is made, the wood is all cut of an exact which they are fond of should be given them, such length, and on the whole the annual saving to every householder by using the saw instead of the axe would in the course of several years amount to something of consequence.

COAV CABBAGE.

Mr Thomas Stockbridge of Weymouth, Mass. has raised this season, about 700 plants of this singular variety of cabbage which grew from two to five feet in height. He considers it superior to anything he ever raised as fodder for cows. They will eat it in preference to English hay, good pasture grass, or any fodder he could give them; and sensibly increased the quantity of their milk Horses eat it freely : but it seems to be peculiarly well fitted for milch cows. He kept a cow through the fall almost exclusively on between two and three hundred plants, although the first year of their growth, and he is satisfied that no plant or grass, will afford an equal amount of fodder from the same space of ground, as they yield a constant succession of thick new succulent leaves as fast as the old ones are placked. They should be sowed as early as possible in the spring, on the richest soil, and raised about two feet apart.

Sore Throat from Cold .- At this season of the year, when common colds are prevalent, a better remedy cannot be prescribed for a soreness or inflammation of the inside of the throat, which often attends a severe catarrh than the following

Mix a wine-glass full of good calcined Magnesis vessel that is partly filled with warm water. Should and Honey to the consistence of paste or jelly, and the lamb be chilled, rub his legs with tow, and let take a spoonful once an hour through the day for a warm cloth be put round it. But if corn, barley, a day or two. It is cooling, healing, and a very gentle cathartic.—Bermuda paper.

> A writer in the New York Journal of Commerce, states that fresh snow from the surface, used in making a pudding, will render it equally light as eggs: two table spoonfuls are to be substituted for each egg; if this proportion is exceeded, the pudding will fall to pieces in boiling,

We ask attention to the following extract of a letter, dated Liverpool, 16th Nov. 1830 :- Our rail road from this to Manchester, continues doing well; the receipts from passengers alone exceed two thousand pounds (sterling) per week, and people are no longer afraid to travel at the rate of twenty miles an hour.'-U. S. Gaz.

At the Portsmouth Dock Yard, Eng., an experiment was lately tried, of the relative strength of house for winter service, which I saw into pieces not a yarn in Capt. Harris' cable was strained.

^{*} Dean's New England Farmer,

Capt, John Sanborn, of East-Kingston, Rockgham County, N. H. raised the past season, 7 bushels of winter Rye, from 7 bushels sowing, 94 acres of ground; being 51 bushels to the shel sown, and about 374 bushels per acre.ewburyport Herald.

American Silk .- If the anticipations entertained some of the friends of the Silk Manufacture the United States are as well founded as we pe they may prove to be, a shipment made by e packet ship De Rham, for Havre, on the 15th, Il no doubt make an interesting event in the story of American Silk. A case was put on ard, as we learn from the American, containing nerican raw Silk, of the filature established in illadelphia by Mr. D'Homergue, at the request the venerable Mr Du Ponceau. Similar shipents, it is added, have been made to England d Mexico.

Six thousand two bundred and eightythree head beef cattle have been slaughtered at the estabhment of Mr Winchester, at Lechmere Point, ambridge) in the short space of thirteen weeks,

Trade,-Which is of the greatest benefit to a y, in a commercial point of view, the importan of merchandize from abroad, or manufacturat home? Watson's Annals inform us that iladelphia contains 104 warping mills, 45t0 avers, 3000 spoolers, 2000 bobbin winders, 1 200 dyers; whose wages amount to \$1,470,-) per annum. That they manufacture \$1,yards per day, or 24,300,000 yards per year. the above may be added various other departnts of domestic industry, from which it may ly be inferred, that Philadelphia supports at t 20,000 manufacturers, besides such as are med mechanics or day laborers. Is not this evidence of her increase and prosperity?

RDENT SPIRITS .- The Journal of Humanity es, that it is supposed to be about 90 years e distilled spirits began to be a common drink n lew England. A pint of rum procured just ere having, lasted then for the whole season. practice was, to put a small quantity into a cle of sweetened water, from which the laborers accustomed to drink. What a fearful adare have succeeding generations made upon the uom of their ancestors!

rinters have probably much more enthusiasm any other set of men employed in mechaniabor. Their implements are the means by th the mighty stream of knowledge is purified enlarged, and rolled onwards towards the nown wastes of futurity.—They multiply the eptions of genius, and enable them to speak igh new symbols to ten thousand eyes at . They are agents to an unknown process, although in part ignorant of its multiform and te tendencies, they have a strong consciousthat they are the conductors of the fire of is to distant regions and times.

e Great Eclipse .- This memorable phenomenon ake place on Saturday next. The following are the s of the eclipse as computed for Boston and its vi-

Dr Hull's Patent Truss. CASE OF MR FISHBURN.

DR HULL, Sir-Under the advice and direction of DR KNAPP, I have been cured within the year past of a had rupture of 9 years' standing, by the use of one of your patent trusses. Thad worn various kinds of trusses before I got one of yours, but they were very buildensome to me. Your truss, on the contrary, is comfortable to wear, and as convenient to put off and on as a pair of spectacles. I wore it not to exceed five months, and found myself cure l. I have not had it on for six months past, and have exerted myself violently at wrestling, jumping, riding, and other hard exercises without any return of the complaint, not even a feeling of weakness in the part. In fine, your truss has made me as sound and well as ever I was; it is one of the most valuable inventions in the world. H. N. FISHBURN.

BALFIMORE, Jan. 1831.

BT Dr Hull's Trusses are sold by Eben. Wight, (sole gent for this city,) Milk-st. opposite Federal-st.

Yellow Locust Seed.

Just received and for sale at the Seed Store connected with the New England Farmer Office, No. 52 North Market Street.

A few lbs. genuine Yellow Locust Seed, (Robinia pseudoacacia) saved near Harrisburg, Pa. expressly for this Establishment. The excellence of this tree for ship timber and fences, its rapid growth, and its beneficial effects on sandy, barren plains, where it thrives well, are too well known to require comment.

Seeds for Hol Beds.

Just received and for sale at the Seed Store connected with the New England Farmer Office, No. 52 North Market Street.

The greatest variety of Early Vegetable Seeds, among which are the following, that will soon be wanted for Hot Beds, viz. Early and Late Cauliflower. (from Europe.) Large Cape Broccoli, (from Europe.) Early Dutch Cabbage; Early York, do; and several other varieties of Cabbage seed, both of American and European growth. London Scarlet Short Top Radish; and Cherry and White Turnip Radish. Early Curled Silesia Let-tuce; Temisball do.; and Royal Cape Head do.; Double Curled Parsley; true Early Hom Carrot, &c.

Also-New Early Dwarf Frame Pea, an extra early, productive and fine variety, that grows from 12 to 18 inches in height only, (according to the richness of the soil) and of course requires no sticks; price 33 ets. per quart. Also, Early Washington Peas; Early Hotspur, do.; Knight's Dwarf Marrow do., and several other

Bees.

Gentlemen in want of swarms of young thriving bees can be supplied by J. B. Russell, at his Seed Store, No. 52 North Market Street, at 17 cents per lb. were raised by Mr Ebenezer Beard, inventor of the new patent hive.

Ammunition 3

Of the best quality and lowest prices, for sporting—constantly for sale at COPELAND'S POWDER STORE, 65 Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be refunded. It Jan. 7.

Farmer Wanled.

Wanted a Farmer, with a wife, without children, the one perfectly acquainted with the business and capable of taking the management of the Farm, and the other fully competent to take charge of the Darry; none need apply without the best recommendation. Address the Publisher of the New England Farmer, Mr John B. Russell, post paid.

Also wanted, one or two Milch Cows, extraordinary milkers, handsome, and not exceeding 4 or 5 years old, for which a generous price will be given. Apply as above, post paid. No application need be made except for very superior animals. 61 Jan. 28.

Farm to Let

To be leased, for the term of five years, or less, a small Farm in Andover, and within four miles of Lowell. A good place for the raising of vegetables for the Lowell Market. Inquire of HOBART CLARK. Andover, Jan. 15, 1831.

Silk Cocoons Wanted.

1 will give cash for Cocoons, from 30 to 50 cents per pound, according to quality. J. H. CŌBB. Dedham, Mass. Jan. 25, 1831.

BRIGHTON MARKET-Monday, Feb. 6. [Reported for the Chronicle and Patriot.]

At market this day 328 Cattle (45 of which were Stores) 384 Sheep and 383 Swine. 30 Stores and all the Swine have been before reported.

Prices—Beef Cattle—In consequence probably of the limited number of Beef Cattle an advance of fron. 17 to 25c. was effected on former prices. We shall quote from 4 to 484-quite a number were taken at 5, and several for 5 17 a 5 25.

Sheep-Sales not so quick-we noticed the sale of one lot prime Cossets at 517.

Swine-One lot of 25 Barrows, selected, were taken at 5c; one lot of 12 Sows, selected, at 4½; one lot of 50 Sows, and Barrows, not selected, at 4c; also, one lot of 167, to close, price not known.

New York Cattle Market, Jan. 31 .- At market this day, from 6 to 700 head Beef Cattle, and about 2000 Sheep. The market for Beef was very lively; prices a little in advance, and nearly all sold. A few very superior at \$8; several small lots extra at 7 a 72; several large do, good, at 6 a 61; several do, fair, 51 a 51; and ordinary 41 a 41 per cwt.-Sheep-demand good, and ordinary 4½ a 43 per cwt.—Sneep—demand good, and sales readily effected; a number of lots extra at \$6; several do good at 5 a 5½; several do fair from 3 a 3½ a \$4; a number lots ordinary \$2 to 250 each. Milch Cows with their Calves—a few sales ordinary noticed at from \$30 to 35 each. Pork in Hogs—scarce, and selling for 62 a 64c. Hay-continues scarce, and is bringing from \$1.6\frac{1}{4}\$ a 1 12\frac{1}{2}\$ per cwt. In this market only the quarters of Beef are weighed, the hide and rough tallow being included without weighing. At Brighton the hide and tallow are weighed as well as the quarters.—Journat of Commerce.

MISCELLANY.

FRIENDLY MONITIONS FOR AMERICA. Prote the Abbe Raynal.

People of America! let the example of all the nations which have preceded you, and especially that of the mother country instruct you! Be afraid of the influence of gold, which brings with luxury the corruption of manners, and contempt of laws! Be afraid of too unequal a distribution of riches, which shows a small number of citizens in wealth, and a great number in misery-whence arises the indolence of the one, and scrydlity of the other. Guard against the spirit of conquest. The tranquillity of empire decreases as it is extended. Have arms for your defence, but have none for offence. Seek case and health in labors, prosperity in agriculture and manufactures; strength in knowledge and virtue. Make the sciences and arts prosper, which distinguish the civilized man from the savage. Especially watch over the education of your children.

It is from public schools, be assured, that skilful magistrates, disciplined and courageous soldiers, good fathers, good hasbands, good brothers, good friends, and honest men come forth. Wherever we see the youth deprayed, the nation is on the decline. Let Liberty have an immovable foundation in the wisdom of your constitution: and let it be the cement which unites your states, which cannot be destroyed. Establish no legal preference in your different modes of worship. Superstition is everywhere innocent, where it is neither protected nor persecuted. And may your duration be, if possible, equal to that of the world.

How to Shake off Trouble .- Set about doing good to somebody-put on your hat, and go and visit the sick, or the poor-inquire into their wants, and minister to them-seek out the desolate and the oppressed, and tell them of the consolations of religion. I have often tried this method, and have always found it the best medicine for a heavy heart .- Howard.

An Eel in New South Wales,-It may not be generally known that there is a gigantic species of eel peculiar to this island, found in most of our rivers particularly where they form ponds or still water. A gentleman who was lately bathing in the South Esk, in one of those beautiful ponds formed by that river, after swimming about some time, sat down to rest himself, as he thought, on round trunk of a tree, lying about a foot under water. Presently the log seemed to glide from beneath him, and he saw it turn its head and eyes towards him, and swim round him several times, moving its body in a zigzag serpentine direction, It was about a foot or fifteen inches in diameter, and about twelve or fifteen feet long, of a dark greenish color .- Hobart Town paper.

Moss Mattresses - made with fine moss are now getting into general use in Russia and Sweden. They are filled to a depth of twelve inches, are very elastic and wholesome, and the cost of renewing them is of course trifling,

Laconic Order of the Day .- Frederic II, wrote, one day to Gen. Salmon, commander at Cleves ... My dear Salmon, if the Austrians come into my territories, tell them they have mistaken their way; if they begin to argue, make them prisoners; and if they make any resistance, cut them in pieces.'

Artificial Pearls .- Lake Williams, in his history of Inventions and Discoveries, says the Chinese obtain false pearls from a kind of muscle, in the folthe time when the muscles rise to the surface of water and occasionally open their shells, they watch the moment and place in each shell five or six small beads strung upon a thread. At the end of the year, when they fish for these, they draw them up; and upon opening them, they discover the bead encrusted with a pearly substance and having a perfect resemblance to real pearls. It is said there is now in the possession of the British Royal Society, large muscle, in which there are several bits of iron wire encrusted with pearl. Those bits of wire it appears were originally rough, and it is judged probable the animal emitted this substance as a means to procure ease from the irritation it must unavoidably occa-

Mr Dandridge, an English naturalist who lived about a century ago, was a renowned butterflyunter, and pursued his sport with such eagerness, as to give rise to some amusing incidents. On one occasion, a countryman at work in the fields, having for some time contemplated him, with his arms extended, hotly pursuing over hedges and ditches nothing, that he could see, at length took pity on the poor lunatic (as the man supposed him to be,) overtook him in his mad career, and pinned him down viet armis, that he might not run himself to death; the consequence of which was a bitter exclamation, that only served to confirm the countrymen in his opinion,- 'The purple Emperor's gone! The purple Emperor 's gone !'

You Forget Yourself .- A disappointed author, indulging in a vem of abuse against a successful rival, exclaimed, 'lle is, without exception, the most superficial, self-sufficient, ignorant, shallow creature, that ever made any pretensions to literature.' 'Gently, my dear Sir,' interrupted a gentleman present, 'you quite forget yourself.

When the famous Prince Lee Boo, from the Pelew Islands, saw a miniature for the first time, he expressed the idea it gave him in a very striking manner : Being asked if he knew the meaning of it, he replied 'Yes, Lee Boo understand very well-that Mr Keate (pointing to the original of the picture) die ; this Mr Keste (touching the miniature) always

An Indian chief of the Creek nation, being once appointed to negotiate a treaty of peace with the people of South Carolina, was desired by the governor and council to speak his mind freely, and not be afraid, for he was among friends :- 'I will speak freely; I will not be afraid,' said he; 'for why should I be afraid among my friends, who never am afraid among my enemies?

A shopkeeper the other day in urging a lady to buy a gown of him, said, buy enough for the sleeves, madam, and I'll throw in enough for the skirt.

Interesting Dispute .- Mr Grattan, in his history of Holland and the Netherlands says, that few factions have, excited such violent commotions in the world, as that which was excited in Holland on the ridiculous question of- whether the hook caught the fish, or the fish caught the hook,

a wise man can answer in seven years,

wise men can't mend.

get it; he who does one should never remember Augusta, Me. Wai, Mann.
Halifac, N. S.—P. J. Holland, Esq. Recorder Office. it .- Churron.

For Sale.

The well known FARM in Dover, occupied for the last fourteen years by the subscriber, containing about 200 lowing manner: 'In the beginning of summer, at acres, well located in a square, bounded on the south by Cochecho river, and on the east by Fresh creek, on which is a tide mill, with an apparatus for pounding and grinding plaster. The Buildings consist of a large two story Brick House, of 46 fect by 38, with a wing of 20 by 16, all well finished, adjoined to which is a shed 34 feet by I-I, connecting the cider house 27 by 37, two stories, with one plastered room, where all the spinning and weaving is done for the family; two Barns, one of which is 100 fee by 42, with two wings of about 40 feet each, one employed as a stable, the other for a sheepfold, with a good vary chame brought from China, which are a species of well walled in; the other is a Store Barn of 45 feet square. of 16 feet post, and will contain 60 tons of hay; a pig gery of 50 feet by 30, with a cellar of 18 feet square up der it, with boilers set to make soap, brew, and cook for swine. The fields are divided by permanent stone walls and consist of one of 40 acres in front of the house, one of 17 on the East, one of 10 acres on the North, (principully orchard,) one of 15 Northeast, and one of 30 acre. West of the house, with three pastures of 20 to 25 acre.

> The Farm has been gradually improving for the las ten years, and the two last has cut each year one hun-dred tons of hay, and 20 to 25 tons of thatch. It is om and a half miles from the village of Dover, which afford a good market. There has been planted some hundred of Fruit Trees, principally Apple, many of which an grafted—with Pears, Cherry, Plum, Peach and Quino trees, and many in bearing, with a small nursery. The terms of sale may be known by applying to Maja

ANDREW PIERCE, of Dover, Mr Samuel Lord, o Portsmouth, or the subscriber on the premises. June 11.

WILLIAM FLAGG.

New Work on Farriery.

Just received and for sale at the Seed Store connected with the New England Farmer Office, No. 52 North

Market Street, The Veterinary Surgeon; or, Farriery taught on a new

and easy plan : being a treatise on all the diseases and accidents to which the Horse is liable; the causes and symptoms of each, and the most improved remedies em ployed for the cure in every case; with instructions to the Shoeing-Smith, Farrier, and Groom, how to acquin knowledge in the art of Farriery, and the prevention of Diseases. Preceded by a popular description of the ani mal functions in health, and showing the principles or which these are to be restored when disordered. By Joh. Hinds, Veterinary Surgeon. With considerable addition and improvements, particularly adapted to this country by Thomas M. Smith, Veterinary Surgeon, and Membe of the London Veterinary Medical Society.

Durham Short Horns.

For sale, several of the pure breed, descendants of the celebrated animals presented by Admiral Sir Isaac COFFIN, to the Massachusetts Society for the Promotin of Agriculture. The pedigice of these animals can be given as far back as Hubback, who was calved in 1777 and is reputed the foundation of this much admired stock Also, several Heifers bred from the same, of various grades, from half up to seven eighths blooded animals For particulars, inquire of E. Hersey Derby, Salem. Sulem, October, 1830.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year-but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

[No paper will be sent to a distance without payment being made in advance.

EO LICETT LEONOUT.

Mr Pussender -- I take the liberty to respectfully quest of you the republication of Mr Niles' acconnying Essay on Political Economy; although your per is not devoted to either side of the momentons estion that is now before the country, I think no one n complain of your impartiality, as you have herefore republished Mr Pemerov's Essay on the other ve upon their int rests,

Yours respectfully, February, 1831.

POLITICS FOR FARMERS!

VERMONT.

We have for some time contemplated a general say, in which certain of the leading principles 1 practical operations, of what is denominated 15 American System,' might be rendered more ailiar to the farmers, and other working classwho have not time to read, nor lessure to instigate, the important subject-though more ply interesting to themselves that any other sons in the United States. It has been delayed, wever, from various causes, and the few facts lected are more examples of the many that tht be obtained, were time and opportunity alred for the gathering of them. We nowprod to the task-so far desirous of brevity, as co apprehensive that we may not always be fully business of our people! lerstood, unless by them, who, while they read, h also think upon what shall be presented to

The primary interest in the United States is tainly that of the farmers :- the next, that of manufacturers :- the third, that of narigand commerce : - the fourth, that of the planters, per. The last, furnishes the largest amount of ie in aticles for export; but, in its general sum production, is at a vast distance behind the first second, and much in the rear of the third. It y be well to say a few words in regard to

Dr Cooper calculated the subsistence, only, of people of the United States, at 640 millions of ars, in 1813-and exclaimed, 'How do the sted panegyries on FOREIGN trade dwindle in gnificance when set in competition with this rated the support of each individual, for food ik and fuel, \$55 a year. We have materiall ered from the doctor-thinking then, as now the was extravagant in his 'calculation!'-bu esupposed that the average cost of subsistence millions of dollars, as the cost of subsistence product of our farmers-but when to this i ported articles, ed the value of fuel used, the food of horse ransportations, &c, of wool, flax, hemp, & , we think that the whole value of the commi

millions of dollars a year,

the United States, including all the cloths required wages of a respectable journeyman mechanic, for bousehold or other purposes, at 20 dollars per which is below the average value consumed. What head. This embraces all manufactures of cotton is the sum of the rents of all the houses in our wool, flax, leather, fur and silk, &c, and is surely cities and towns? And the product of these, it below the real value. The aggregate is 240 mil- must be observed, are as well added to a general e of the subject. I think it important that FARMERS lions of dollars-of which many thousands con-amount of subsistence, as bread or clothing, buld understand the metits of the American System, Isume more than their proportion in boots and shoes w groundless are the complaints made against it-and only, for it includes shoemakers' bills as well as products of the farmers, by which we mean the at an important beneficial effect the protective duties trillors and hatters, &c. And if to this we add growers of grain, grass, roots, meats, wool, &c. the manufactures of iron, and other metals, of in distinction to those of cotton, sugar, tobacco and wood, in houses and ships, and furniture, of min- rice. erals and earths, such as brick, glass and wares, the aggregate cannot be put down at less than 450

fishing and foreign, including passengers and goods transported in steam boats and canal boats, with ble food. The unual supply, for 12 millions, is, the profits on exchanging commodities, cannot be then, 4,380,000,000 lbs, -or 22 millions bbls, of less than 100 millions a year, all which is put into flour. It is no matter of what this food consists. subsistence, fuel, &c, consumed.

In addition to these, we verily believe, that the Dr Cooper and Mr McDuffie must adnat it! disbursements of the people of the United States for travelling on land, with stage hire, horse-feed, turnpike rates, &c, is of larger amount than what in Europe-but in 1819 only 750,660; showing a we have regarded as the 4th great branch of the decrease if one half, in two years, and the des-

If the whole cotton crop be a million of bales. r 300 hundred millions of pounds, or 30,000,000 tated at 12 millions more; but, say, 45 millions potation, a large amount to be deducted from the paid for British food. general sum. Fortyfive millions of dollars are more than the worth of all the cotton, tobacco, sugar and rice, annually supplied in the United States. Well may we exclaim in the words of Dr. Cooper, 'how do the boasted panegyries,' on the planting interests, 'dwindle into insignificance when compared with, the farming or manufacturing! And though, as before observed, the planters supply a large proportion of our articles for export, the whole proceeds would go but a short way towards feeding the people of the planting states if the land- the quarter, or 13 cents on a barrel of flour. There holders were not also furmers. Their crops of is a grade of duty for every shilling of the value grain and grass, &c, are worth a much mightier of a quarter of wheat, (or other grain) - from 72s,

We invite a careful consideration of these things. Mathematical accuracy is not aimed at for them In the \$25 per annum,* for the whole United and cannot be attained. It is sufficient that our riculture,—There has been another little bubble tes, considering the cheapness of food in many calculations are reasonable. The aggregate for about short crops in England; but, at the last is of the interior, and that we have two mile subsistence and clothing of all sorts, all kinds of advices, the duty on a barrel of our flour was 3 dol-

*From this some 30 millions may be deducted, for im-

† This view of the planting interest will strike many of other working animals, the value of timber an our readers with considerable force. It seems to be a new view of the subject. Admitting that it requires 90 and held up for our imitation! Britain excludes dollars a head to feed, clothe, and provide the people of the United States with all the rest of the things that less price than her own costs her people, even they need, their comforts require, or luxuries demand,-The average cost of paupers, in many establishment the whole product of the planting interest would supply when she has a tair and tull crop; but we ought we wish to err, if err we must 'on the 'safe side only 500,000 people. The people of the United States consume, each I lb. of flour a day, or it- equivalent in other vegetable food-this is less than the amount given to The amount carned in freights, coasting, inland decently-fed slaves, a peck of corn (10 lbs.) a week being allowed per head, with other vegetathe domestic circulation, and invigorates every If of wheat flour, the average cost will not exceed brench of business, especially the agricultural, for two cents for each person per day; which we think is a pretty moderate rate of living, and suppose that

The greatest export of flour was in 1817-1,479,198 barrels, because of the very short crops tractive uncertainty of the foreign market. In 1828, the export was 860,809 bbls.-in 1829, 837,385; of which latter, 210,384 went to Engollars, the tobacco, sugar and rice may be esti- land, on a speculation of short crops, but was nearly all reshipped to the British West Indies or a the whole product of the planting interest, at elsewhere, or retained until it became sour, befar and average prices, including the costs of trans- cause that the duty required upon it could not be

We shall here explain what this duty is. It falls as the price of grain rises. Thus-when British wheat is at 50s, the quarter of 8 bushels, of 70 lbs, each, (or about 130 cents for the American bushel of 60 lbs.) the duty is 44s. Sd. per quarter, equal to 5 dollars 98 cents on a barrel of flour !- when at 60s, the quarter, (equal to inore than a dollar and a half the American bushel,) the duty is 24s. Sd. the quarter, or \$3,30 on a barrel of flour; when at 72s., (the starvation point, it is only 1s. sum than those of cotton, sugar, tobacco and rice, † to 50s. At the first, the duty is nominal, but as the price declines, it becomes beavy, and soon runs into prohibition. It is thus that England watches her ags of slaves. This moderate sum will give ut farming or family utensils, the building and repair lars-so none had been sold for consumution! But there had been a few days of sunshine; and as the price of wheat was declining, the duty was about to advance. This is a chief part of the British 'free trade system' so much spoken of, our flour, though we might furnish it at a much when she has a fair and full crop; but we ought

them ourselves, and as cheaply as she will; as shall be seen below.

The American consumption requires the equivalent of 22 millions of barrels of flour; the for- naturally moist, cold, half peaty lands of New eign demand takes less than 900,000. The dois, unsteady. In 1817, the value of all the vegeonly 9,079,762. like this. The foreign flour trade cannot, at any time, be depended on. We have exported more things at home, we are indebted for three-fourths of the perplexities, or embarrassments, which the farmers of the United States have suffered, as must appear manifest to every reflecting mind .-As it regards foreign trade, we are

Pleas'd with a rattle—tickl ed with a straw. [To be continued.]

GRAFTING,

Mr Fessenden-In your paper of Dec. 31, a new mode of grafting is described, which is said to be an improvement. I desire also to show you another new mode of performing this operation, which may prove equally valuable.

When trees begin to show their fruit, (no matter what kind) and it is made evident that grafting must be resorted to, or we must patiently put up with an inferior kind; instead of cutting off the top, uncover the roots and choosing the most thrifty one, make a slit in the bark, cut your scion off with a slope, and thrust it in and cover the roots with earth. It will take well, and grow some the first year, much more the next, and the third year the old stock may be cut away, and the growth from that time on will be very rapid, and soon form a good bearing tree. CALVIN.

Preston, Ohio, Jan. 23, 1831.

GRASSES.

Letter from Hon. John Lowell, to the Trustees of the Massichusetts Society for the Promotion of Agriculture.

Will you permit an associate, who has for 25 years been connected with you, but who from ill health has been compelled to withdraw. himself from your society, and labors, to make must be admitted to be of very small value. As lavor of this great mixture of seeds; I can only a few remarks on a subject of great interest to the cause of agriculture? The topic which I propose to discuss, is the cultivation of the various kinds of vegetable productions which we comprise under the name of grasses. I understand by this term, all those vegetables, which are consumed by domestic animals, as food in pastures, or as hay.

There certainly is no subject more important to those parts of our country which depend on raising, and fatting domestic animals of the useful ever reaches its third year. classes, the ox, the horse, and the sheep.

I know very well, that I shall be met at the outset, by the reply of practical farmers, that we are not to be instructed on this subject. We know tionably the best gift of Providence, to pasturing ice briefly of the experiments of others, which better than any theoretical farmer can know, what is best suited to our soils—we have herdsgrass, creeping roots. It will come in spite of all your The orchard grass, dartylis glomerata, is one of and clover, (white and red,) and red top, and we efforts, and if it were not for its natural enemy, he grasses frequently sown in Great Britain, though want no more. They are better for us than any the couch grass, it would in ten years overcome all cannot find that it is used on the continent of of your outlandish grasses. Wait, gentlemen, I other grasses. It makes admirable hay-the very Europe. It has been growing into favor in this reply; there is one Yankee grass unknown to best of hay for all sorts of cattle. adapted for this purpose. I laid it down with harley, but it grew so fast that I was obliged to cutthe barley stalks very short, or else I should not have been able to thresh it, so thick and succulent was the incerne. I cut over this field once, and then depastured it.

I mention this fact as a remarkable one, because the French writers speak of it as a very rare occurrence, even in their climate, that it will bear the scythe the first year.

At the South and in New York, the lucerne has done as well as with me. Yet many persons have not succeeded with it here. It will not endure wet or black soils. The land in which I have raised it, is a warm soil-the surface good, but leaves are apt to turn brown or perish before thin on a gravelly bottom. It has stood drought flower stafk is fit to cut. From this cause the better than any other grass. I have always used or of the hay is not only not aromatic, but it gypsum, and perhaps owe my success in part to o my senses positively disagreeable. In drying, that valuable stimulant. I have employed two oses more in weight than any hay with which I bushels to the acre. If my repeated experiments shall result in its successful culture, I shall be happy; and if not, I shall have the consolation of well meant endeavors in a good cause.

Respectfully yours.

GRAFTING THE GRAPE.

J. LOWELL.

Much has been said in the Southern Journals about a recent discovery as to grafting the vine. it has been announced in such terms, as would lead ignorant persons to suppose, that to that persen alone was the merit due,

I am induced to make great allowance for the nabitual grandiloquence of our southern friends, They are very prene to use high sounding words. But, in fact, horticulture was an advanced art ter, to such an extent as to render its culture in the North when it was unknown in the South, racticable. I have not heard of its success in and but imperfectly so in the Middle States. It is equally true now. Massachusetts is far before the lucerne grass I have now cultivated for New York and Pennsylvania in Horticulture, if you take into view the improved state of private gardens, the number of its green and grape houses, and the beauty of its country seats. There do not exist in the whole range of the United States more finely cultivated or highly ornamented coun-

But to the point of the grafting the grape, My and success, far exceeded those of any former excellent friend, the late Ebenezer Preble, 20 years since grafted the vine with as much case as he ly first piece, (four years from the seed,) I regrafted other plants, without grafting into the root, ed for soiling. It was cut down four times, I have done it often, but with not so entire success. a pastured the fifth. The first cutting was on No doubt the grafting the root is more sure, but it does not apply to the grafting in vineries. There he second piece was sown with red top, and you need the skill which Mr Preble and the French eut and made into hay three times, and de-gardeners possessed of grafting in the limbs.

The March of Science bids fair to put to flight the whole race of conjurors, fire-eaters, and sleightof-hand gentlemen. The mode of eating burning charcoal and swallowing melted brimstone with impunity, has lately been published to the world. The manner of performing many other wondrous feats has not escaped the eye of philosophic inquiry. We propose to amuse our young readers by teaching them a trick or two, for the knowledge of which we are indebted to a foreign paper,

By steeping an egg for some time in sharp vinegar, the shell will be so far softened, that it may be extended lengthways and put into a phial without breaking. By pouring cold water into a phial, the egg will regain its original shape.

To make an egg dance, boil it hard, take off a small piece of shell at one end and then thrust into it a quill filled with quicksilver, sealed at each end. So long as the egg contains any heat it will dance about on the table.

By holding a faded red rose over a chafing dish of hot coals on which some sulphur has been placed, it will become quite white. In this state, dip it into water, and then place it in a drawer for a few hours; when taken out it will be quite red

If the surface of a bowl of water be sprinkled well with lycopodium, the hand may be thrust into the water without wetting it,

When withdrawn a slight shake will rid the hand of the powder,

Interesting to the Ladies .- The Journal of Health strongly recommends simple soap and water, as the best wash for preserving the complexion, instead of the thousand varieties of cosmetic lotions, which are so much used. There are five beautifiers of the skin, viz :- personal cleanliness, regular exercise, temperance, pure air, and cheerful temper. Let all pouting beauties ponder on this. The Journal puts its veto on the use of distilled liquor, Cologne water, &c, and insists that, to use them for a wash, is to destroy the suppleness, transparency and smothness of the skin, and cover it with unseemly blotches.

Death of Gen. Bolivar .- From our correspondent of the Newport Mercury, we learn that the Brilliant, arrived there 10th inst. from Carthagena, Jan. 5, brings information that Gen. Bolivar, died at Santa Martha, on the 19th Dec. Minute guns were fired, and flags displayed at half-mast for three days at Carthagena .- Bost, Pat.

Franklin used to say, that when he saw ashes thrown on the ice before a door, he knew where good natured people resided. - 1b.

The number killed and wounded in the late revolution at Paris on the side of the people alone was by a late return, 1162 killed and more than 3000 wounded.

EXTRACTS FROM MR. SEDGWICK'S ADDRESS.

Theodore Sedgwick, Esq. has lately delivered an Address before the Berkshire Agricultural Society, of which he is President. It is replete with good sense, and the soundest maxims of Political Economy. We make the following extracts :- Mass. Jour.

'It is observed by foreigners, that we are a profuse people. They are most familiar with our cities, the mechanic gets better fruits and vegetables, and and there observe our extravagance in equipage, for a less price. It is the natural advantage of the dress, and at our tables. They are astomshed by division of labor. In living so much as our laboring this profusion, and do not understand it. In Europe, people of the same relative fortunes, would be fright sult neither health or economy. They do not seem ened at the thought of living as we live. And that to understand that animal food is by far the dearest? we live like a wise people nobody can contend .-Take city and country together, was ever so much bankruptcy heard of in any country? and for what? Elsewhere men fail, because they have lost a house, or a ship, or been unfortunate in some other way .-Here, four out of five "fail for their expenses." may be thought that a public speaker, in a plain, economical state of society, is pushed hard for a topic, when he thinks fit to warn his neighbors against extravagance. Simple and economical as we have been allowed to be, it is certain that New England can never prosper when our people have ceased to possess this character.
use in mincing the matter.

Besides, there is no
Things are out of proportion through the whole country. Our children begin with a degree of expense, with which we with large families end. Their dress, houses and furniture must be the same with ours; and this too in a country, in which the partibility of estate requires a constant struggle to enable families to maintain their ground. We all strive in the most scrvile (and may I not say vulgar?) manner to be alike, and to appear one as well as another. The exterior, what is visible, indicates little or nothing as to the wealth of people. The middle classes follow hard upon the heels of the rich, and are as much held in slavery by the fashion, as if there were a chain about their necks. The young men and women who are just entering life, the day laborers, and the poor, following, of course, so high an example, catch the contagion and the latter, especially, become sensual, vain, and expensive, run into crime, and end in the State Prison. Our villages which should glory in pure manners, ape the very silliest fashions of the cities .-What is worst of all, we have been taught, and multitudes do actually believe, that this folly is necesary to the prosperity of society. That is, "all trades must live," and to make them live, they begin by destruction. They do most conscientiously believe, that in this way, merchants, mechanics, and shopkeepers prosper, and grow rich.'

* * *

'Massachusetts has a larger population, for its territory, than any other State. Our population, especially, makes our riches. We must retain this population, or grow poor. It cannot be retained without a constantly growing enterprize, skill, in-dustry and frugality. We have not the same advantages of soil and climate that many other States have. Availing ourselves of other circumstances, we must hold out to our people the solid advantages, and real charms, of an older, but still progressive society. Those improvements, therefore, which are for the good of a majority; which naturally belong to the public to take care of; which demand public encouragement in order to be successfully commenced, must be fostered by the State, in some way or other. This is the true policy; and a selfish, local and private interest must not, and will not. be suffered to stand in its way. Everything possible must be done to bring our resources to light. -This Society should look through the remotest parts of the County, to see if there be not some new occupation, or trade, just springing up, which demands encouragement, and this for the purpose, too, of exof the County.

converted into cloth-paper is made from the straw not even excepting the servants: but, on takin of rice—the cup of the acorn dyes black—the leaves leave, this order is completely reversed; the salut of a certain description of ash, answer, in part, the tion is first tendered to the servants, then to the chi purposes of the mulberry, for the silk worm. In this way, the occupations of people are infinitely diversified. For instance, in every village as large as Pittsfield, and perhaps smaller, there ought to be regular gardening, as an occupation. In this way, people do upon beef, pork, and potatoes, they con-

ICELAND.

A short time ago we noticed among our literary items, an abridgment of a very interesting book about Iceland, lately published by Perkins & Marvin, of this city. We now offer a few extracts from it .- Mass. Journal.

'Their predominant character is that of unsuspecting frankness, pious contentment, and a steady liveliness of temperament, combined with a strength of intellect and acuteness of mind seldom to be met with in other parts of the world. They have also been noted for the almost unconquerable attachment broke forth from the same pool, a little to the east which they feel to their native island. With all their the great one, and was evidently connected with privations, and exposed, as they are, to numerous dangers from the operation of physical causes, they live under the practical influence of one of their common proverbs: "Iceland is the best land on which the sun shines."

'The Icelandic is justly regarded as the standar! of the grand northern dialect of the Gothic language. The remoteness of the island, and the little intercourse which its inhabitants have maintained with the rest of the world, have effectually secured the purity and originality of this ancient language; and it is a curious fact, that while our ablest antiquaries are often puzzled, in endeavoring to decipher certain was a gentle declivity, where the water ran out, as words and phrases in writings which date the origin only a few centuries back, there is not a peasant, nor indeed scarcely a servant girl in Iceland, who is rot capable of reading with ease the most ancient documents extant on the island.

'The early and successful application of the Icelanders to the study of the sciences, forms a period anomaly in the history of literature. At a period when the darkest glosm was spread over the European horizon, the inhabitants of this comparatively barren island, near the north pole, were cultivating the arts of poetry and history; and laying up stores of knowledge, which were not merely to supply posterity with data respecting the domestic and politic erable, and very ambiguous. A small reddish spc cal affairs of their native country, but were also des- scarcely larger than the point of a needle, breakso tined to furnish very ample and satisfactory informa at first about the forehead, nose, corner of the eye tion on a great multiplicity of important points counected with the history of other nations."

'The form and ceremonies of the Icelandic church are strictly Lutheran. The total number of parishes in Iceland amounts to 181. The clergy are all natives of the island, and are maintained partly by cultivating small glebes attached to the churches, and partly from certain tithes raised among the peasants The provision made for their support is exceedingly scanty. The richest living on the island does not produce 200 rix-dollars; twenty and thirty rix-doars are the whole of the stipend annexed to many d the parishes; and there are some in which it is ever as low as five.

on the mouth, without distinction of rank, age, o is wild and haggard; the pallid red color of the bod sex, is the only mode of saiutation known in Iceland is only reheved by the most disgusting ulcer except someomes in the immediate vicinity of the which becoming deeper, putrid, and virolent, m factories, where the common leclander salutes a for only affect the bones and joints, but, as they sprea eigner whom he regards as his superior, by placing over the skin, deep ravines are formed, which gi his right hand on his mouth or left breast, and ther it an elephantine appearance, whence the name ek citing an interest in the Society, through every part | making a deep bow. When you visit a family in phantiasis. The fingers get quite stiff and crooker Travellers say, that there is not a useless vegeta- and rank, beginning with the highest, and descend degrees. During the hight, the patient is harasse

> The following is a description of the Great Geyser, Jetting Pool, near Mount Krabla:

' Nearly about the centre of the pool, is the ape ture whence the vast body of water, sulphur, ar bluish black bolus is thrown up, and which is equ in diameter to the column of water ejected by the Great Geyser at its strongest eruptions. The heigh of the jets varied greatly; rising, on the first propu sions of the liquid, to about twelve feet, and contin ming to ascend, as it were, by leaps, till they gaine the highest point of elevation, which was upwards thirty feet, when they again abated much more r pully than they rose, and after the sponting ha cased, the situation of the aperture was rendere visible only by a gentle ebullition, which distinguis ed it from the general surface of the pool. Durir my stay, which was upwards of an hour, the eru tions took place every five minutes, and lasted abo two minutes and a half. I was always apprised the approach of an eruption by a small jetter th as there was a continual bubbling in a direct lin between them. None of its jets exceeded twelver feet, and generally they were about five. Anothhubbling channel ran a little way to the northwe of the principal opening, but did not terminate in jetter like the former. While the eruption continues ued, a number of fine silver waves were throw round to the sides of the pool, which was lined wit a dark blue bolus, left there on the subsidence of the waves. At the foot of the bank on which we stoo were numerous small holes, whence a quantity steam was unremittingly making its escape with loud hissing noise; and on the west side of the po was conveyed through a long winding gulley to the foot of the mountain. The soil around the marg was so extremely soft, that it was not without impr nent danger I endeavored to thrust my thermomet into the liquid, in order to ascertain the degree its heat; an attempt which proved fruitless, as the glass got obscured by the sulphureous exhalation

The leprosy prevails in Iceland: owing to racid food, want of cleanliness, and clothes kept w by the universal employment of fishing. It is the most horrible distemper incident to man.

'In its primary stages, its symptoms are inconsiand the hps; and, in proportion as it increases, other pustules make their appearance on the breast, arm arm-pits, &c, which generally dry up in one place and break out in another without pain, till the die ease has considerably advanced, when they cover a most the whole body, give the skin a scabrous a pearance, stiffen it, and terminate sometimes i shining scales, which fall off like dust, sometimes i maliguant tumors and swellings. The patient, in the mean time, labors under lassitude of body, anesthe sia, and lowness of spirits. When the malady be comes invoterate, the breath, which before was diagreeable, now gets intolerably fætid; a strong und tious matter is perspired; the hair, already change in color, falls off; the voice grows hourse and nas Both at meeting and parting, an affectionate kis and the face becomes terribly deformed. The loo Iceland, you must salute them according to their age and the nails and other parts of the body fall off b with terrible dreams, and he is oppressed by day, with a tedious melancholy, in which he is often tempted to make away with himself. He gradually surrenders one part of his body after another to the insatiate maledy; and at length death, the long wished-for deliverer, comes suddenly and puts an end to his misery.

'As the leprosy is infectious, almost every person shuns the company of the sufferer, which must greatly add to the misery of his situation; nor can he flatter himself, after the distemper has advanced to a certain degree, with any hopes of relief from medical assistance. It is considered to be irreguarly hereditary; yet the symptoms do not become risible before the person has reached the years of naturity. In cases of infection, too, it generally happens that three or four years clapse before any eruption breaks out in the skin. It then proceeds with slow but steady progress, and it is possible for he person who is afflicted with it, to drag out a vretched existence to the protracted term of fifty or ixty years. Very emphatically have the inhabiants of the East given this disease, among other ignificatory designations, the name of "The Firstrefying corpse, than which there is nothing a peron inveterately affected with the leprosy more perectly resembles.'

BLACKSTONE CANAL.

We have been favored, by one of the Comissioners of this Canal, with the following abract of the detailed report, submitted by the reasurer to the corporation, at their late annual eeting.

The business of 1828 commenced late in Oct. id continued but little more than one month. uring which time the tolls amounted to about even hundred dollars; and the business of 1829 as much affected by the general pressure felt

every portion of New England, but more urticularly by the various manufacturers, on the osperity and success of whose concerns, this ompany will at all times be much dependent. In dition to the general pressure before mentioned, e navigation of that year was considrably inrrupted, by frequent breaches in the Canal and pendages, as might reasonably have been expect. in this, like all other works newly constructed. ne gross receipts for tolls, that year amounted to ght thousand six hundred and three dollars; the pense of repairs on the Canal, the expenses of k tenders and all other charges, except the Colctor's compensation, were paid by the commisoners, and included in their general account of sbursements for constructing and building the mal. The operations on the canal for 1830, are w closed and the result known. The gross nount of tolls for this year, is twelve thousand and is transported, is 14,842, viz: 7312 carried up, d 5330 brought down, being an increase of more in 50 per cent, on the number of tons transportin 1829. In that year the whole number of the last described? is was 9448, viz: 6292 carried up, 3155 brought WD.

Rail Roads.—The first anniversary of the conneement of the South Carolina Rail Road was ld at Charleston on the 15th inst. 'Charleston's st Friend' made two trips on the part of the ad that is finished, having several pleasure cars ached, in which were more than 100 passene eaten, &c, &c.

MILCH COWS.

sideration of the character and condition of our milked with great care and very thoroughly to get

How much milk ought a cow to yield to be that our cows are in milk? Is there much, if any, first calf will be fed well and with some additional yield little or no return of profit? Questions like them hold out. these, and there are many such, ought to be put and answered in the New England Farmer. may turn out that our dairy stock is extremely low in character and its management wasteful.

It something like an average quality of milch cows could be settled-to afford a standard-and it should be understood that no good farmer would keep an animal for milk that fell below it; all the cows in the country would soon come up to that standard and go beyond it.

A milch cow, of medium quality, in this State, will give, it is supposed, 12 quarts of milk per day orn of Death." The Icelandic "Likthra" is scarce- for 2 months after calving, and about 7 quarts per It properly signifies a rancid, pu- | day on grass feed for the next four months, and 4 quarts per day for the next following 2 months, and perhaps 2 quarts one month longer. Altogether 1500 quarts in a year.

> butter, and 4 quarts to yield a pound of cheese. The skim milk and dairy whey may be valued at \$3 a cow per annum.

> Now, a cow that gives 1500 quarts of milk in a year will produce 166 lbs. of butter, worth at 16 cents per lb. \$26 56 Skim milk, say

Or 1500 quarts of milk will give, at 4 quarts to per lb. will be Whey, say

Nothing is said of the worth of the calf, as all the milk the cow gives is credited. A milch cow's keeping one year cannot be short of 25 dollars in the interior

Suppose a farmer to resolve that he would keep no cow that did not hold out as a good milker 9 months in the year - and that did not give sixteen quarts of milk per day for 2 months after calving, and 12 quarts per day the next four months-and six quarts per day the next 3 months, and 2 quarts per day the month following. - Such a cow would yield per annum 3000 quarts of milk,

Here it may be remarked, that with the addition of 5 dollars per annum to the cost of food as estidollars and one cent, and the whole number of mated for a common cow, the neat profit would probably be four fold.

Is it not practicable to have throughout the country, as common dairy stock animals as good as

This question is submitted to farmers for consideration. The probability is, that in taking some pains to get stock as good, they would get even

If the various modes of obtaining this object one. were resorted to at once and with zeal throughout the country, there would be a prodigious improve- all his descriptions. The manure brought in new ment, in a very short time. - No young animal of grasses. It encouraged and invigorated the old. promising appearance for milk would go to the s, including a detachment of U. S. troops, with butcher. - More care would be taken of young but it is no triffing thing to render useful an artiield piece. A Federal salute was fired, a dip-stock.—More young stock would be retained to cle formerly thrown away. We know so little of

would think more of the advantages of employing The attention of farmers is invited to the con-bolls of the improved breeds .- Heifers would be them into the habit of holding out long as milkers. If they once dry early, no care and keeping afterworth her keeping? What is the average time wards will correct this fault .-- Heifers with the waste of fodder among us by keeping animals that care the last 3 months they are in milk, to make

The profit of a milch cow is not generally un-It derstood. Milk is not only the most nutritious but the cheapest article of food. The food necessary for a cow in full milk, does not exceed in price, one third of what is necessary in feeding for the

These few remarks are hastily made to draw out farmers, and particularly scientific farmers, on this subject. There is a great deal to be said upon it, and a great many facts to the purpose, which should come to light .- Mass. Agric. Report.

BONE MANURE FOR WET MEADOWS. To the Hon. Thomas L. Winthrop, President of the Massachusetts Society for the Promotion of Agriculture.

SIR-It is well known to all readers of agricultural works that a vast variety of substances are used It takes 9 quarts of milk to give a pound of in older countries than ours (for the purpose of increasing the fertility of lands) which have been unknown to us. It is no reflection on our country, because we have not wanted them. The time has now arrived in Massachusetts at least, in which these treasures should not be lost I beg leave to mention one, not of my own discovery, but to which I have been indebted to the sagacity, and liberal intelligence of my neighbor. A few years since, 30 00 the Hon. William Ellis of Dedham, recommended to me the use of the head and feet bones of the pound of cheese, 375 lbs. which at 8 cents oxen as a highly valuable manure on meadow \$30 00 lands. He said that he had observed in passing, 3 00 that I had grounds remarkably well adapted for this manure. I however neglected his hint. 33 00 though I constantly kept it in mind, until the last year, when seeing an immense load of the heads of oxen passing by, I inquired of the owner, for what purpose he was carting those materials, and he answered me to the following facts, viz. That he came down a distance of eight miles with an empty team, and was carrying back a load, which cost him two dollars, to put on his meadow land. I found that it was no new experiment with him. and that he came often for this purpose,

Here then I had facts. I knew the habitual economy of our citizens, that they were not remarkably prone to idle experiments, or to wanton expenditure,

I entered with my very intelligent informer into many particulars as to the process and effects, but I own that I was more impressed with the simple fact, that he would devote his team and labor for a day and pay two dollars for his materials besides, than with all his other assertions.

If this man can afford to come 16 miles, and carry back a manure which costs him as much as a load of dung, surely it must be more valuable to me, who can eart eight loads at the expense of his

I made the experiment. Its success surpassed

I am aware that it is only of limited application, linsure a better selection for milch cows. Farmers the philosophy of manures that I shall not speak on this subject. All I shall say is, that there is much animal matter still adhering to the bones, and animal matter has been found by experience to promote the growth of vegetables.

The mode of application is to break them up with a sledge, or with the back of an axe, and then to press them below the surface by a rammer or beetle. The only point to which I offer my testimony is, that the effects are much greater than an equal quantity of horse and cow-dung. This may be relied upon.

Very respectfully yours,

J. LOWELL.

NEW ENGLAND PARMER.

BOSTON, WEDNESDAY EVENING, FEB. 16, 1831.

FARMERS' WORK FOR FEBRUARY.

Neat cattle, pigs, and poultry should be kept in good heart at this season of the year, otherwise they will lose much of their value before warm weather, and half the summer will clapse before they will recover from the effects of the winter's short keeping. If you intend that your cattle shall derive much nouriskment from their food, you will see that they are well sheltered and lodged, besides being well fed. Cattle which are shivering with cold, drenched with rain, or covered with snow, will pine on the richest and most expensive provender.

Too much fodder should never be laid before cattle at once. It is better to give them but little at a time, and give that little often. By constantly breathing for some time on their food it becomes in a degree filled with effluvia and moisture, which causes the cattle to reject it. They will, however, generally eat food of that kind in the open air, which they have refused, when offered to them under cover; especially if it is laid on dry straw long enough for the moisture to evaporate. Care, however, should be taken that your cattle should not be put on short allowance, and it you give them but little at a time let them be fed often.

By experiments which have been repeatedly made in America and in Great Britain it has been ascertained that grain and roots for fattening cattle, swine, &e, will go one third farther if steamed or boiled than if used raw. Every farmer, ought, therefore, to have conveniences for steaming food for his stock as well as his swine. A steam boiler may be made by setting a kertle holding about 10 or 12 gallons, in a furnace of brick or stone, and over this a hogshead with one head taken out, and the other bored full of holes, which is set so close that the steam of the kettle, when boiling can only rise through the holes and thence ascend among the articles to be steamed in the hogshead, and pass off at the top. In this way, a hogshead fiall of potatoes will be nearly as soon boiled as a small part of them only would have been if placed in the kettle underneath. As the kettle must be so closed as to prevent any steam from passing of acting in future. off, but through the bottom of the hogshead or vat, a pipe or tube must be set on one side, through to be lodged at night in some convenient place which, with the aid of a funnel, the water may be poured into the kettle as often as occasion may require. After the water is poured in, the tube should be stopped with a plug. Grain of all kinds may be advantageously steamed for feeding or fatting swine. But in that case, it is necessary that the bottom of the hogshead should be covered the dampness of the night; cows should at all with a cloth, to prevent the grain from running times be kept in high health and good condition: down through the holes.

the most useful of which are particularly described in the New England Farmer, vol vi. p. 22. When it is wished to cook food for cattle in small quantities, it may, (as has been well observed by old, and will continue in a good milking state till Judge Buel) be done at little or no expense over a she is ten years old or upwards. The times of kitchen fire, on the evenings preceding the days milking should be as regular and equi-distant as in which the food is made use of.

On the proper selection of cattle, horses, sheep and swine, and their management, the profits of a farm must at all times materially depend. If we have those of an unproductive kind; if too many or too few-if fed without judgment, or fatened that recompense which a farmer ought to obtain.'

calving is not agreed on, some contending that they may be milked almost to the time of their dropping the calf without injury; while others maintain that it is absolutely necessary that they should be dry from one to two months for the advantage of both the cows and their calves. It is probable that much, as regards this question, must depend on the way in which the cows are kept; where they are well fed they may be continued in milk till within a week or two of their calving, without their suffering any inconvenience from the continuance of the milking. But as our cows are usually fed at this time in the year, they had better go dry for a month, six weeks or even two months, to give them a chance to recruit. It is said that the longer cows are milked the more free their udders will be from any soreness or tumors. Where only one or two cows are kept for the supply of a family it may be well, by extra feeding with roots and other juicy food, to prolong the period of milking to a week or ten days before the time they are expected to produce their young.

In order that you may know the proper time to have your cows go dry, an account should be kept of the time when each cow takes the bull, that she may be dried off at a reasonable period. The following prescription for drying off cows is given in Monk's Agricultural Dictionary.

'Take an ounce of powdered alom; boil it in two quarts of milk till it turns to whey; then take a large handful of sage, and boil it in the whey till you reduce it to one quart; rub her udder with a little of it, and give her the rest by way of drink; milk her clean before you give it to her; and as you see need requires repeat it. Draw a little milk from her every second or third day; lest her udder he over charged.'

Cows become dry too soon if they are not kept well, or not milked clean. It is said in Bath Papers, vol. ii. p. 294, if at any time a good milch cow should go dry before her milk is gone, get a young calf and put it to her, in order to preserve ber milk another year; for it is well known if a cow goes dry one year nature will lose its power

Cows which are shortly expected to calve ought under cover for a week or two before calving, as it may be the means of saving the life of the calf, and perhaps of its dam likewise. The day and night after a cow has calved, she should be kept under cover, and her drink should be luke warm. Let her not be exposed for some time to Several other kinds of apparatus have been used they will not recover their flesh, nor be in good Society for promoting Agriculture, for 1831' that

in steaming food for domestic animals, some of milking condition till summer is half spent. A cow well wintered is half summered, and a cow well kept through the summer is half wintered.

The cow is commonly in her prime at five years possible. Dr Deane observed that 'six in the morning and six at night is a good general rule. But if they are milked three times a day as a modern writer on husbandry recommends, it may be done at five, one, and eight. He believes that if they are well fed they will give half as much again at too great an expense, they will deprive us of milk by milking thrice as if only twice; at the same time it would prevent too great a distention of The time cows should become dry before their their bags to which our best cows are liable.

The keeping of cows in such manner as to make them give the greatest quantity of milk and with the greatest clear profit is an essential point of economy. Give a cow half a bushel of turnips, carrots, or other good roots a day during the winter months besides her hay, and if her summer food he such as it should be, she will give nearly double the quantity of milk she would afford if kept through the winter in the usual manner and the milk will be richer and of better quality.

On the means of improving both the quality and the quantity of wood .- A memoir on this subject has been presented to the Academy of Sciences, and reported upon by M. Coquebert Montbret. In the sheep, says M. Petri, the nourishing fluids are natually distributed between the flesh, the fat, and the wool. By frequent shearings, made when the animal is young these fluids may be determined in great abundance towards the skin and will then nourish the woollen fibre. This theory he says he has applied with great success, and he finds that besides increasing the quantity of wool, its quality is very much improved and the staple rendered finer. This improvement may be transmitted from one generation to another so that whole flocks may in this way be converted into fine wool animals, only by taking care to reserve those animals for reproduction which yield the most improved produce and paying attention at the same time, to the choice of food and to the other circounstances and eares which are necessary. It appears that M. Petri has not yet had time to prove the result of prolonged trials conducted upon these principals .- Revue Encyclopédique, xlvi.

MASSACHUSETTS AGRICULTURAL RE-POSITORY.

A number of that valuable work, (which had been for some time suspended) has just issued from the press, in a very handsome style.

It is published by John B. Russell, Proprietor of the New England Farmer, from the Press of I. R. BUTTS. It contains the Address by JOHN C. GRAY Esq. delivered before the Massachusetts Agricultural Society, Reports of the Committees of the last Brighton Cattle Show, and a number of other valuable articles, most or all of which we have or intend to transfer to our columns. We think this an excellent number, and one which cannot fail to greatly enhance the agricultural interests of those Farmers who will give it a careful perusal, and apply to use the information with

which it abounds. It appears by a notice which precedes and infor if they are suffered to become lean in winter, toduces the 'Premium List of the Massachusetts e Committee who direct the concerns of the ociety, have determined to 'intermit the Brighon Cattle Show for one year? and of course iere will be no Agricultural Exinbition under e auspices of the Massachusetts Agricultural Prince, Jamaica Plains. ociety next autumn. The Committee state iat the general management of farms-the opations of the dairy-and a thorough field culare for vegetables and grain crops will engage eir attention as leading objects; and their largest remiums will be appropriated the ensuing season encourage and reward distinguished merit in ese particulars."

Butter and choese are among the staples of New ngland, and it is obvious, that a small improveent in their quality will add a large sum of oney to the income of this district of country. nd there is every reason to hope, that a indicious neouragement by premiums will, in a few years, ve a character to our dairies, not surpassed by w part of the world. To accomplish this more rely, it may be of use to admit, for a time, a impetition for our premiums, for butter and ieese, from beyond the limits of the state, and ithout any restriction as to their origin; that, practicable, we may have specimens to compare th our own, even from other countries. We ry thus have an opportunity of attaining to a eater certainty the degree of excellence of nich these important articles of food are susotible, and, by the comparison, learn the impertion of our own processes of manufacture -and thaps we may have the satisfaction to find that, some extent at least, both butter and cheese

Some premiums offered in past years for the ouragement of plantations of forest trees, live iges, and apple orchards, and for useful experints, and valuable inventions, will be continued. n conformity with the views above expressed, Trustees of the Massachusetts Society for moting Agriculture propose to have an Exhion of Butter and Cheese, in Quincy Hall, in new Market House, Boston, on Wednesday, seventh day of December, 1831.

and they offer the following premiums, to be arded by a committee of competent judges, ected by the Board, to the proprietors of the lots of Butter and Cheese exhibited, without rd to the place of manufacture.

or the best lot, in tubs, pots, or firkins,

cless than 300 lbs. \$100 00 or the next best, not less than 300 lbs 50 00 or the best, less than 300 lbs. and not than 100 lbs. 30 00

or the next best, less than 300 lbs. nuot less than 50 lbs.

or the best, less than 100 lbs. and not than 50 lbs. or the next best, less than 100 lbs. and

ess than 50 lbs. or the best lot of Cheese, not less than

year old, and not less in quantity than

ir the next best, not less than one year and not less in quantity than 300 ths. or the best Cheese, less than one year

and not less in quantity than 300 lbs. 50 00 or the next best, of not less quantity

**CORRESPONDENT'S, - We are obliged this week to an interesting article from Portsmonth, N. H., and dom Cambridge, Mass. We should be glad to hear pound, according to quality. r from either of the writers.

Gardener Wanted.

A single man, who is a thorough Gardener, well acmainted with the raising of Grapes under glass, and Plants, and all the branches of his business, will meet with the best encouragement on application to John Feb. 16

Grass Seeds, &c.

For sale at the Seed Store connected with the New England Farmer, 52 North Market street-

A few bushels of genuine Fewl Meadow Grass Seed, raised in New Hampshire expressly for this establishment: also, Lucerne, Red and White Clover, Tall Meadow Oats Grass, (raised for us by Mr PHINNEY,) Herds Grass, Red Top, Orchard Grass, (raised for us by Mr Noves.) Hemp Seed, Flax Seed, Broom Corp, &c; all of the very first quality. Feb. 16.

Cocoons, and Silk Weaver Wanted.

Cash and a fair price will be given for Cocoons. Also, employment for a Silk Weaver, on application to Warren, R. I. Jan. 15, 1831. PAUL WARE. Il'arren, R. I. Jan. t5, 1831. White Mulberry Seed.

For sale at the Seed Store connected with the New England Farmer, 52 North Market street-

A small quantity of fresh White Mulberry Seed, of the growth of 1830. Gentlemen in want of this Seed that can be depended upon, are advised to apply soon, as the supply here, and throughout the country, is uncommonly small .- Short directions for its culture furnished gratis with the seed.

Two-rowed Barley Wanted.

Cash will be paid for a few hushels of Two-ROWED BARLEY, of the first quality, plump, and free from any other seeds-for sowing-at the Agricultural Warehouse, No. 52 North Market street, Boston.

Cow Cubbage.

Just received, at the Seed Store, No. 52 North Market street, from London a small quantity of Seed of the Cow Cabbage; it is thought that no plant cultivated in this country will give so much todder from the same space of now made in Massachusetts, not inferior to ground, for Milch Cows, as this. It has been successfully best in other countries cultivated to a large extent in New England and the Middle States the past year, and promises to be a great acqui-

Silk Reel.

These useful machines may be had of the subscriber for the low price of \$25 each. By the help of this reel, the silk threads may be extracted from the cocoon with evenness and rapidity. It is the same for which I received the premium of the Massachusetts Agricultural Society. and has been a considerable time in use.

Dedham, Mass. Jan. 25, 1831.

[CERTIFICATE.]

I. Edward Brown, of Ashford, Con. late of London, England, silk manufacturer, do hereby certify, that I have used a considerable quantity of raw silk reeled in the filature of Jonathan H. Cobb, of Dedbam, Mass.; that I find the silk reeled by him equal to the Italian or China silk, and is capable of being used in the manufacture of any description of silk goods. I further certify the trientmings for a suit of curtains now in the house of rion.

Daniel Webster, of Boston, was made of raw silk raised and reeled by said Jonathan II. Cobb. EDWAR D BROWN.

Ashford, Ct. Jan. 15, 1831.

20.00

Gentlemen in want of sweens of young thriving bees can be supplied by J. B. rausell, at his Seed Store, No. 52 North Market Stree', at 17 cents per lb. were raised by Mr benezer Beard, inventor of the new 15 00 patent hive.

Ammunition 3

Of the best quality and lowest prices, for sporting— 65 Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be refunded. If Jan. 7. Farm to Let,

To be leased, for the term of five years, or less, a small Farm in Andover, and within four miles of Lowell. A good place for the raising of vegetables for the Lowell HOBART CLARK. Market. Inquire of Andover, Jan. 15, 1831. Jan. 21.

Silk Cocoons Wanted.

I will give eash for Cocoons, from 30 to 50 cents per J. H. COBB. Dedham, Mass. Jan. 25, 1831.

BRIGHT ON MARKET-Monday, Feb. 14. [Reported for the Chronicle and Patriot.]

At hasket, this day, 546 Cattle, nearly all of which were Beet; 734 Sheep, and 340 Swine—95 Swine have neen before reported; about 75 Beef Cattle and nearly all the Swine remain unsold.

Prices .- BEEF CATTLE-Last week's prices were not supported, particularly on thin Cattle; we shall quote from \$3 84 to 4 75. We noticed several yoke of prime Cattle taken at \$5, and one or two yoke at \$5 25.

BARRELLING CATTLE-Mess \$3 75 a 3 84, No. 1, \$3 25 a 3 33.

SHEEP-We noticed one lot taken at \$5, one at 4 50 one at 3 84, one at 3 50, and one at 3.

SWINE-Rather dull, no sales of consequence effected.

Wool .- Arrived coastwise since our last, about 50,000 lbs, various kinds. The following comprise the principal sales of the week: 15 a 16,000 lbs. American fleeced and pulled, various qualities, price and terms unknown.— 23,000 lbs. \(\frac{1}{2} \) and \(\frac{3}{4} \) blood fleece which arrived from the state of Maine, 58c per lh.; 15,000 lbs. 3 blood, 58c; 10,000 lbs. Saxony and Merino fleece, 70 a 75 per lb. 6 mo.; 10,000 lbs. Lambs, 50c per lb. cash; 20,000 Saxony have also been sold, precise price and terms we are unable to give, supposed a shade over 90c per lb. on a credit .-Limited sales also of Russia, at 30c per lb. cash .- Patriot.

Hemp .- The Portland Advertiser states that three or four loads of Hemp, of excellent quality, have been brought to that market from Vermont, Several loads have been brought to Boston from St Johnsbury, Vt. and sold for \$225 per ton; it is of superior quality, and may be seen at the store of Messrs Lincoln, Fearing & Co No. 110 State street.

MISCELLANY.

FOR THE NEW ENGLAND FARMER.

THE SHAKERS, OR UNITED SOCIETY.

There are sixteen Societies of this peculiar denomination in the United States; in Maine, New Hampshire, Massachusetts, Connecticut, New York, Kentucky and Ohio. There are in all of these Societies the population of about 5000. Each society consists of 3 and some 4 families (so called:) the largest and most central Family is called the Church. These church families coutain 60 and so on to 100 members. Two societies generally constitute what is called a Bishopric; each Bishopric is under the administration of 4 Elders (2 males and 2 females) whom they greet with the title of Ministry. The Ministry reside alternately at each Society. They have the appointment and dictation of all the other elders and others of the societies in their Bishopric. Each of the churches and families have 4 elders (2 males and 2 females) who have the immediate care of the spiritual concerns of their respective families. Each church has 2 trustees who are the keepers of the money, &c, belonging to the church. They have an office for the transaction of business with those who are not of the society; in their name are written all the deeds, notes, &c, they also do all the tradings, and make all stipulations with (what they call) the world's people. Distinct from them are also two deacons who have the management of the domestic concerns and to whom the members make application for whatever they are in want of, and their resources are supplied by the trustees. No individual keeps any money -or can call any property his own, but all is ceded to the general common stock, so that, according to the answer a young lady among them made to an inquiry, if she possessed any property there, 'Nothing is mine, but all ours.'

They have a covenant which is signed by all the members of twentyone years of age and upwards, the purport of which is-they resign all claim as individuals to any property which is there or that they may bring into the Society-all claim to any remuneration for their services - and they will devote and employ themselves to their best abilities for the support and promotion of the Society, having secured to them a good living and equality so long as they remain members and no longer. Parents in general give their children a small portion of their property, but the main part to the society.

left to judge and act for himself, though an idle, soon finds no comfort or enjoyment and therefore such ones generally expel themselves. Each one has his or her allotted employment so that every branch has its necessary attention paid to it.

They have a numerous list of Orders or Gifts, as they are called, with them, which they are very fearful likewise of losing his place, slipped the piece strict and attentive in observing; besides the many relating to their religious life, they have those of a temporal nature, which are of equal importance

It is against order for any one man and woman to converse or be together without a third. For any one to blame or censure another on any account before any one except their elders, or expose their ewn trials except to them; it is also against order to leave any gates open, bars retorted his companion.

down or to permit any broken windows to remain so, which they are very strict in observing. They are also very strict in having cleanliness and decency observed in their houses and door. Planters of the Western States, that he has just arrived yards; it is against order even to shut the doors hard, or to spit upon the floor, or to be anywise hoisterous in their dwellinghouses. They always have a place for every tool, and keep every tool in its place, consequently have nothing lost; many of these rules trifling as they may appear, it would be well to have adopted by every household or the well known Agricultural Establishment of Messrs community. They generally have two dwellinghouses in each church and one in each family; those in each church or family all sit down at one table, and meet three evenings in a week together for their evening devotions, which are generally singing, dancing and a reminding of their orders and gifts; they always before these meetings retire. to their respective rooms in their dwelling houses and observe the strictest silence for the space of half an hour. They retire at 9 o'clock (all at one perfectly acquaint d with the business and capable one time) and arise about 4 or 5 in the morning, of taking the management of the Farm, and the other They are very regular and temperate in their diet, having no extravagances, and moderate in their habits having no superfluities.

Their farms and orchards are in the highest state of cultivation, they have been long noted as manufacturing the best of articles, such as brooms, pails, tubs, sieves, &c, and also for raising garden for very superior animals. seeds, but it is not to be wondered at that the recent great advancement in Horticulture has left them behind in this respect.

They are very attentive to company of which they have much in the summer season; and truly it is time pleasantly spent to visit their beautiful, neat villages. There is one in Shirley, Massachusetts, which the traveller would pronounce the most pleasantly situated and neat viliage this State | affords; it has a beautiful white church about 6 or S dwelling hooses, and 20 or 25 other buildings in which are carried on the various branches of mechanism, &c.

One good turn deserves another.—Santenil, a poet of the 17th century, returning one night to the Abbey of St Victor, at eleven o'clock, was refused admittance by the porter, on the plea that the prior had absolutely forbidden the doors to be opened at so late an hour. A good deal of alternation ensued; of Agriculture. The pedigree of these animals can I at last the poct slipped a piece of gold under the door, which was quickly opened. When fairly in, he pretended he had left a book on the stone, where he had been suting during the dispute, and begged the porter to go for it. Encouraged by the generosity of the poet, the man readily complied. In the As to their requirements of duty, each one is meanwhile, Santeuil fastened the door; and the porter half naked, was obliged to stand knocking in indolent person, with this industrious community his turn. 'I cannot let you in,' said the poet; 'I am very sorry for it: but the prior has given positive orders not to have the doors opened at so late an hour.' 'I let you in,' said the perter, in a very humble tone,
'So you did,' replied Santeuil; 'and I will do you the same good turn for the same price.'

> The porter not liking to sleep in the street, and of gold under the door again; saying 'I thought a poet's money would not stay long with me;' and so gained admittance.

> A lawyer in the District of Columbia having wearied the Court by a very long and dull argument, his colleague respectfully suggested to him the expediency of bringing it to a close. The lawyer angrily replied 'I will speak as long as I please, sir!' You have spoken longer than you please, already,'

Agricultural Warehouse and Seed Store.

CINCINNATI, OHIO.

The subscriber respectfully informs the Farmers and in this city from Boston, with a large and general assortment of AGRICULTURAL IMPLEMENTS of the most approved kinds; with also a general and very extensive assortment of Grass, Garden, Field, Flower and HERB SEEDS, which will be found to comprise a larger variety than has ever before been introduced into the We tern country.

The above articles have been recently purchased from NEWELL and RUSSELL, in Boston, and were selected by the subscriber limiselt, (who has been for several years engaged in the business) with great care. Those who may call at his Agricultural Warehouse, No. 23, Lower Market street, between Sycamore and Main streets, will be assured of finding every article wanted in the agricultural line, of a superior quality and at fair prices. S. C. PARKHURST.

Cincinnati, Jan. 1831.

Farmer Wanted.

Wanted a Farmer, with a wife, without children, the fully competent to take charge of the Dairy; none need apply without the best recommendation. Address the Publisher of the New England Farmer, Mr John B Russell, post paid.

Also wanted one or two Milch Cows, extraordinary milkers, bandsome, and not exceeding 4 or 5 years old for which a generous price will be given. above, post paid. No application need be made excep

New Work on Farriery.

Just received and for sale at the Seed Store connecte with the New England Farmer Office, No. 52 Nort Market Street,

The Veterinary Surgeon; or, Farriery taught on a new and easy plan; being a treatise on all the diseases an accidents to which the Horse is liable; the causes an ymptoms of each, and the most improved remedies en ployed for the cure in every case; with instructions to the Shoeing-Smith, Farrier, and Groom, how to acquire knowledge in the art of Farriery, and, the prevention Diseases. Preceded by a popular description of the an mal functions in health, and showing the principles (which these are to be restored when disordered. By Joh Hinds, Veterinary Surgeon. With considerable addition and improvements, particularly adapted to this countr by Thomas M. Smith, Veterinary Surgeon, and Membe of the London Veterinary Medical Society.

Durham Short Horns.

For sale, several of the pure breed, descendants of it celebrated animals presented by ADMIRAL SIR ISAA COFFIN, to the Massachusetts Society for the Promotic given as far back as Hubback, who was calved in 177 and is reputed the foundation of this much admired stoc Also, several Heifers bred from the same, of various grades, from half up to seven eighths blooded animal For particulars, inquire of E. Hersey Derby, Salem.

Salem, October, 1830.

Published every Wednesday Livening, at \$3 per annur ayable at the end of the year-but those who pay with axty days from thet one of subscribing, are entitled to ad arction of fifty cents

We might multiply facts like these without num-

Such is the connexion between agriculture and A more special application of the benefits derived manufactures. We shall now notice the folly, or Massachusetts, Rhode Island and Connecticut, protection of domestic manufactures are 'taxes' 204 millions of pounds of cotton and \$57,000 bbls.

Taxes, of some kind, must be paid. A revenue goods, home-made, for eight cents, or 3 of a cent cents per lib.-if the duty is a tax, the shot is worth only one per cent lb., and so on. The duty on wheat is 15 per cent-or ' 15 cents on every s; about three fourths of the whole export ten? This could not have happened, but because dollar of its cost,' as the 'free trade' folks saybut is any farmer foolish enough to believe that a tax of the United States is collected on the wheat the basin!' He might almost as well breat as they now do, were that system' destroyed, that he grows and consumes? It is a popular cry, ished that the mills which prepared his So i may be said that we should require as many that duties are taxes? so was the halloo, Great were destroyed. The people of the cities shoes, were all the shoe-makers guillotined! But is the Diana of the Ephesians.' A falsehood, on an on, New York, Philadelphia and Baltimore, everybody knows that it would not be advanta-idol, placed in opposition to truth, and the eternal twice as many men as farmers, graziers, goots for the farmer to stop his plough and let his principle of truth ! There is a duty of 3 cents ers, &c, as Asia, Africa, Europe and Amer-horses remain idle to make a pair of shoes. If per pound on cotton—is cotton advanced in that amount, because of that duty? Pshaw! We en of that division of labor just above al- sylvania, Maryland and Virginia, can anake wheat cannot dwell longer on such subjects—and must

MANUFACTURES OF IRON. - This is a leading interest in the United States, and a great supporter of the home market, as every farmer, in the neighborhood of iron works, well knows. The following shows that decreased prices have invariably followed increased duties. As to iron manugreatest cities in the world, Nankin, in that the general amount of our trade with the factures, no patriot will contend that we should be nd Jeddo, in Japan, are thus mantained; a West Indies has not been materially effected by dependent on any foreign nation for them—they ount of home trade is transacted at them, an opening or closing of the British ports.* But are essential to the independence of our own-and

> The first encouragement was given to rolling iron by the tariff of 1816, when the duty was

^{*} Much the largest amount that we ever had exported, in one year. The average of 1816 to 1822, inclusive, was less than 110 millions of pounds a year.

[†] But in the last year we exported 265 millions of pounds of cotton, valued at \$26,575,300. Has the demand and value been reduced by the tariff? It is difficult to resolve what is meant by the 'oppressions of the south,' and what it has to complain of, because of the progress of manufactures. A duty of nearly 10 millions is levied in *We have exported 100,000 bbls, of flour more to the England on so much of our tobacco as costs about one ginia submit to this, has always excited our curiosity.

fixed at \$30 per ton, and so it remained until 1828, when it was raised to \$37 per ton. In consequence of the act of 1816, fifteen new rolling mills were immediately crected, without including the new establishments west of the mountains-and land, if any there is, is in the difference of the cost Sheet iron and boiler plates, (better than the English), which sold for \$180 the ton, eight or nine years ago, may now be had for 130 or \$140 the ton. We speak always of wholesale prices. Rolled round iron has had the same reduction in ties; but the duties on very course and very fine

by a duty of 3 cents per lb, by the tariff of 1828, these materials. The farmers have had a large and which sold for \$150 a ton a few years ago, is now selling for \$120 a ton.

Braziers' rods, which had never been made in this country until protected by the tariff of 1828, with a duty of 31 cents per lb., and were sold at \$150 aton, or 62 cents a pound, now sell for \$135 a ton, or 5 cents per lb., though 'taxed' $3\frac{1}{2}$ [1823, will hardly bring that sum even now. Last cents per lb.

had an average value of 7 ets, until 1828, and now sell for $5\frac{1}{2}$ cents per lb. The duty on nails is 5 and so are flannels. Such wool as sold for 18cents per lb. If the duty is a tax, value of the cents last year is worth 30. nails, is only half a cent per lb.

These, and such as these, are the articles of iron best protected-and they show a general decline of about 25 per cent or one fourth, in price, as compared with their value previous to such protection. On hammered bar iron, the duty was 45 cents the cwt. in 1816, raised to 90 in 1824, at which it remains. It was worth (the superior qualities), \$100 the ton, a few years since, and now sells for above the surface of the ground, under the sion. only \$85-a reduction of 15 per cent, because of It occurred to me this day to examine my trees, the domestic competition, excited by the 'tariff.

MANUFACTURES OF WOOL .- The duties laid upon foreign wool, for the protection of American around the trees, I am in hopes to prevent further farmers, (and which we heartily approve of, exceed trouble. I offer these limis that all may not be, as to the coarsest and finest qualities, because we do not produce any of the former, and very little to the latter), has prevented a large general decline in the price of woollen goods, except in what we call the medium qualities, which were about 25 per cent less last year than previous to the increased duties upon them. The price of wool has advanced, and so have such cloths-but they are still cheaper, of American manufacture, than ever they were, of English product, under a mere revenue duty. The very fine cloths retain pretty nearly their old prices, though rather less. All mixtures of cotton and wool are much cheaper. The 'Welsh plains' which averaged at least 65 cents a vard, previous to the tariff of 1824, fell to 60 cents, on the increased duty, as soon as certain of our factories were put into operation. And the article known as ' Canton cloths,' a much more valuable one than the 'Welsh plains,' sold last year at from 56 to 60 cts, Their price has since advanced, because that the stock of foreign coarse wool is exhausted, and there is no domestic supply. Negro cloths, such as in 1825, 6, 7 and 8, sold for 27 cents-and because a glut, last year, for 22 cents—now sell for 42 cents—for the reason assigned. The south im- 388 lbs. Fees, deducting expenses, \$80,39. Of posed the duty on coarse wool, and will pay it!

quality of cloths, and not so easy to make out a clear comparison of prices but it is manifest, that Otsego, Chantauque, Cattaraugus, Tompkins, Chetheir cost has generally declined with the increase nango, and Herkimer. The hop market opened of duties on them. The fact is-that the manufac- the last season at 121 cents a pound, and mainture of a yard of cloth, in the United States now can- tained that price till near the close of the season, not cost less than in England, because of new and when they gradually advanced to 16 cents.—Daily the expectation that it will be repealed, nexts improved machinery, not used in the latter country, Advertiser.

and which, perhaps, should not be used, because of the great number of persons that it would throw out of employment. The difference in the cost of county, to one of the northern counties of the s a yard of cloth, made in the U. States and in Eng. of Ohio; his remove was in the winter, and of the wool and dye-stuffs used -for the protection of farmers and planters. As before observed, we heartily approve of these duties, so far as they af- his swarm of bees into the garret, where t feet articles produced by us in reasonable quanti- (remained till spring. wools and indigo, have a direct tendency to tax wilderness, he forgot his bees, and neglecte Small hoop iron, (a new manufacture), protected consumers of the cloths made out of or dyed with place them out of doors, as is the custom; advance in the price of their wool, and we are glad of it; we as much wish an advance in the value of cotton.

A great rise in the price of flannel was predicted-but, with two tariffs heaped upon them to increase the price, such as was sold for 23 cents in year these goods were 17 cents only .- This shows Cut nails were eight cents per lb, in 1821, and that the taiff has no effect on their price. Wool was cheap in 1828, 9, and is now more valuable

1To be continued 1

A SEASONABLE HINT.

Mr Russell-I would recommend to your readers who have young peach trees under their charge to look well to them at this season; as the snow has remained so long upon the ground, the field mice are making great depredations by grawing the bark completely around the tree, a little and I found several entirely destroyed and others slightly touched, 'By shovelling the snow from like myself, A SUFFEREL.

Brookline, Feb. 21.

HORSE MANURE, &c-Query.

Mr Fes-engen-1 should like to be informed by some of your intelligent correspondents, the best way to insure the greatest, efficacy in the use of horse manure taken from the stable in Warch or April and intended to be used on land that is to be at that time (March or April) turned over and planted with corn; and also how many cart loads to the acre would be considered necessary. Can you inform me or will Mr PHINNEY take the trouble through your paper how he made his drills when he planted his corn 'on the furrows' after the sward was turned up? Did be mean to say that his land was not farrowed with a plough after the first ploughing previous and preparatory to. ploughing the corn, and that it was not planted in hills in the usual way? A Young Farmer.

Newburyport, Feb., 1831.

HOPS IN ALBANY.

John C. Donnelly, inspector of hops in Albany, has during the last year, inspected 606 bales, 140,this 116,430 lbs, first sort, 18,621 second do, 2,544 It is difficult to fix a determinately descriptive third do, 2,793 refuse; 372 bales were from Madison co.; 141 from Oneida; the rest from BEES.

A few years since, a farmer removed from took with his other moveables a hive of bees, at the end of his journey be located in an old house, and for the want of a better place he

Among the many cares of a remove into with the return of spring, and the opening of wild flowers of the wilderness, they did not get their duty, but 'gathered honey every day f every opening flower,' until the live was fu overflowing. They found abundant passage tween the logs of the house. When the was full, instead of swarming and going off, merely removed a few feet from the old hive tached themselves to a log in the same room. went to work; others attached themselves to ontside of the hive, and continued their or tions in open view, in this manner for set years. When the family wanted honey, they t into the room, and broke off what comb they reed, without molestation. Having abundant roo the garret, they never left it in swarms. It is pr ble that the room was nearly dark, but of this not informed. From this circumstance, the in itants when they build their houses, finish (small tight room, in the garret, or other converpart of the house, exclusively for the bees, timbers or braces to which they can attach comb, having a tight door to the room, to exmice, &c, and I understand they are not mol by the bec-moth or miller. I could much ex upen this subject, but time does not permit, I is quite sufficient for a practical man to im the hint .- Genesee Farmer.

MINCHESTER AND LIVERPOOL RAIL ROAD, tract of a letter to a gentleman in Windsor, Vt. Liverpool, 25th Dec. 1830.

Our Rail road is continuing to surprise mor more every day. The mail is now transported Between the 16th Sept. and the 7th inst. 6 passengers have been conveyed along it, d which period there have been only eleven inst of the journey (32 miles) exceeding by ha hour the time fixed for its performance (2 he Indeed as to speed there is no limit. ginger Mr Stephenson went the whole distar try a new Engine in fiftyeight minutes. Locomotives are much improved in their com tion; and they have now adopted the plan of their cylinders horizontally .- Windsor, Vt. 0

AXATOMY.

Not only is this knowledge of anatomy necessary the surgeon, but it is of so fleeting a nature as to uire constant practice to keep it fresh and ght. The oldest, most practised and adroitest geon will never essay an ordinary operation on a ng subject, before he first has traced out his track, h the certainty, and all the solemn sanction of or death, on the dead subject. It is dissection, cated and reperated dissection alone, that can ch him, where he may cut the living body with edom and despatch; where he may venture, only h great circumspection and delicacy; and where must not on any consideration attempt what man's anization would render fatal.'

In the disease of the liver, pain is generally felt he top of the right shoulder. The right phrenic ve sends a branch to the liver. The third ceral nerve from which the phrenic arises, sends nerous branches to the neighborhood of the ulder : thus is established a nervous communican between the shoulder and the liver. This is a , which nothing but anatomy could teach, and rds the explanation of a symptom, which nothing anatomy could give. The knowledge of it ald infallably correct a mistake, into which a per-, who is ignorant of it, would be sure to fall; in persons ignorant of it do constantly commit the

Disease of the liver has been known to be errously treated as rhenmatism in the shoulder, and erior may have been fatal to the patient, by ing to a fatal and insidious disease an opportunity aking root in the system. Disease of the liver ot unfrequently taken for disease of the lungs. too, persons treated for disease of the liver, have n found to have had no disease of the liver, but sense of the brain.

Persons are often attacked with convulsions, ecially children :-convulsions are spasms ;sms of course are to be treated by anti-spasmo-But these spasms are only symptoms, denotan important disease of the brain, where only remedy is to be applied; and the ignorant praconer who prescribes and administers anti-spasmos, not only loses the time in which the remedies ave life can be successfully employed, but actuexacerbates the disease and accelerates its fatal nination. In the hip complaint, so terrible and aful a disease, the first pain is felt in the e, not in the hip. Of the numerous painful ctions of the abdominal region, the lungs, the rt, the head and the extremnies, some are traceto a nervous origin and are known as Neural-Diseases. Dissection has enabled the anatomist ollow the perves from these portions of the hua frame into and through the spinal marrow, and er large but remote masses of nervous matter: nd this has suggested to the physician the truly osophical remedy for the painful affections of se regions, produced by disordered nerves; viz. pply remedies to the back,-the less obvious but seat of the disease, instead of to the immedilocality of the pain. Remedies thus applied e had the happiest effects, and afford new and king illustrations of the necessity of anatomy to successful practice of medicine.

Error in all these cases is inevitable without a owledge of anatomy; and experience so far from ling to its detection, would rather serve to conit. Ignorance of the mode of properly applyhis experience deprives the unskilled in anatomy

the ability of profiting by it.'

Richerand has recorded of Ferrand, chief surgeon | der. Hotel Dieu, that he killed a patient by mistaking aneurism in the arm pit for an abscess. De en mentions a person who died in consequence the opening, against the advice of Boerhaave, of a ilar tumor near the knee. Vesalius pronounced amor on the back to be an aneurism, but an ignor-

death. Such mistakes are easy, except to those of Barnstable, has been engaged for twenty years extracts from Davie's Report on Legalizing the Sondy thoroughly skilled in anatomy, which in all such cases in the cultivation of cranh cries, that his grounds is therefore necessary to prevent the most deadly have averaged for the last ten years, seventy hush-

> be stopped by external pressure, applied to the wounded yessel, or if this be not feasible, by boldly cutting down to it and applying a ligature. Pare, in a moment of enthusiasm, supposed he had been led to this discovery by the immediate influence of emigrating to Michigan, or to the Rocky Moun-

> 'It has enabled the surgeon to attempt operations, which without it would have been impossible and desperate; but more, it has taught him that where a hemorrhage is apparently so violent as to threaten instant death, the mere pressure of a finger directed by uncrring science may check the living torrent, till there be time to tie the vessel up and give a market? This is a very natural question, but is nature time and opportunity to repair the loss that reasily answered; go where Mr Hayden went, if you has been sustained.

'But without that perfect knowledge of the whole human frame, of every vem and artery, muscle, nerve and bone,-that anatomy only can give-the surgeon with the aid of the best apparatus, with the most perfect self possession, would find his efforts defeated, and valuable lives would be lost to society.'

'In the present practice in England, where amoutation is performed at the proper time and in a proper manner, it is computed, that ninetyfive persons out of one hundred recover from it. Among the ancients, the operation killed ninetyfive out of one hundred. Among the moderns it cures ninetyfive out of one hundred; such are the results of dissection and the study of anatomy,'

AGRICULTURE.

The Charlotte county, New Brunswick, Agricultural and Emigrant Society held its annual meeting some days since. Dr Fryre in the chair. The eleventh annual report states, that general improvement in amount of production, and mode of cultivation has taken place. We copy the commencing and concluding paragraphs of the report, as they are interesting generally, and most of the sentiments expressed in them apply to Nova Scotia as well as New Brunswick:

' In the usual perception of events perhaps no undertaking can be more philanthropic and truly patriotic than that of fostering the productions of the soil, in a new country, where science had only begun to lighten the gloom of its forests, and where the laborious avocations of man are mainly circumscribed within a few removes of primeval rudeness. When thus engaged we are preparing the surest foundation by which to provide subsistence for ourselves and fellow creatures, and at the same time will secure the future welfare, prosperity and independence of our country. And while the silent hand of time in its advancing course reminds us to be up and doing, the retrospect of past labors becomes doubly dear from the consciousness that under divine favor they have not been altogether in vain, ** The President and Directors appeal to the patriotism of the Members, to persevere in passenger on the Boston Neck. the most laudable temporal pursuit in which man can embark-the support of his kind and country,-and they confidently trust, that if the meed of praise, that most powerful incentive to perseverance. be due to honest exertions, it will not be withheld from those devoted to Agriculture.'-Halifax Recor-

CRANBERRIES.

A new field is open for speculation to those who have low lands, and it is hoped that some of our Monroe farmers will be wise enough to profit by it. The practitioner opened it and the patient bled to New England Farmer states that Capt. Henry Hall, Ohio, 4 weeks, a case not known for over 32 years.

els per acre, and that some seasons he has had 100 'Anatomy has taught that the flow of blood can bushels. 'Mr F. A. Hayden, of Lincoln, has gathered from his farm, this season, 400 bushels of cranberries, which he sold in this city (Boston) for \$600.' Now, where is the propriety of farmers tains, when they can be compensated for their labor in this manner, in the immediate vicinity of our large cities, where the comforts of life and the blessings of civilization are so easily obtained. Now let us look a little further into this business. If we go to raising cranberries, where shall we find are not suited with the New York market. Cranberries, unlike most other kinds of small fruits, are capable of being transported to Europe, without suffering by the voyage, and we have seen American cranberries selling in London at eight dollars per bushel, as fresh as when first gathered from the marshes. Now let us compare this kind of farming, with raising wheat in the northern part of Ohio and Michigan, where we believe the price the last season has been about forty cents per bushel and the produce twentyfive bushels per acre. We will suppose the cultivation of one acre of land in either crop to be the same, but this is for the sake of brevity, and is in favor of the wheat: we will allow the wheat to be threshed for every tenth bushel, and that the cranberries cost twenty cents per bushel, for harvesting.

The produce of one acre of wheat, 25 bushels at 40 cents, is Cultivating same \$5, threshing same \$1,

Net profit,

The produce of one acre of cranberries, 70 bushels, at \$1 50, is \$105 Cultivating same \$6, packing same \$14,

Net profit,

Thus it would appear that the net profit of one acre of cranberries in New England, would be equal to twentyone acres and a quarter of wheat in the northern part of Ohio and Michigan : now this is all well; there are some people who seem to require care to make them happy, and thus by emigration, they can increase their cares twenty fold, on the same amount of business .- Genesce Farmer.

LABILITY OF STAGE PROPRIETORS .- A verdict of fifteen hundred dollars was obtained, in the S. J. C on Monday in an action for damages brought against the proprietors of the Boston and Providence Citizens line of stages by an individual whose leg was severely fractured and who was other wise injured by the overturning of the Carriage in which he was a

Wook.—Something new.—For a short time past, agents for unknown persons have been employed in some towns in this vicinity, in buying up all the wool on the backs of the sheep, to be delivered after shearing. They advance the cash for it, at from 48 to 55 cents per pound. One town, it is thought, has received, and will receive, in the course of the season about \$25,000 for wool.-Windsor, Vt. Chron,

COMMUNICARIONS.

To the Eddor of the New England Farmer-

MR FESSENDEN-I observe your request in your last paper, that I should make some answer to an inquiry concerning a swelling originating in the neck of a horse of a gentleman in Maine. I do not recognise any disease with which I am acquainted; it may be a form, possibly, of the farcy; but I profess to know nothing of that disorder; neither do I believe it to be common among us. I wish, however, to make a few observations concerning other communications in your paper,

As to an important point in agricultural publications, I have before given my opinion. I have often myself regretted my ignorance of botany, without a knowledge of which science, it is, of course, impossible to identify or describe plants with complete correctness. I could wish, for the benefit of your readers out of the old commonwealth of Massachusetts, that your correspondents would sometimes recollect that the language of Massachusetts is not spoken all the world over. It must excite some surprise, however, that the universal term in New England for grass sowed to be mowed, is not understood in Philadelphia; it is however, an indefinite and unmeaning expression, none of the grasses, I believe, commonly sowed in New England, being natives of England. The term is here applied to the grasses we sow to be moved, and to natural upland grass suffered to grow for that purpose, to distinguish them from 'meadow' or 'fresh grass,' and 'salt grass' and what grows where the vicinity of salt water is felt, 'Meadow' hay and 'fresh' hay are both corrupt and indefinite terms. What is meant by 'blue joint' and 'flat grass,' I do not know. 'Blue grass' here is also called 'wild rye;' and grows sometimes in moister land, but is a common accompaniment of dry soils; and is called a certain sign of a soil suitable for growing Indian corn. Whether it is native or not, I do not know; but it is said to be of English origin. It is very general indeed. The 'herds grass' of the Southern States I have always understood to be what we call 'fowl meadow:' and that this last is not the same grass with 'red top' (though it resembles it; but is a grass which grows in very moist land: 'red top' being clearly an upland grass, and making the only superior hay we have, though it is never sowed for that purpose; and the superstition has been that it would kill horses, which is very far from being received as orthodox doctrine by me.) Whether they are the same grass, however, and whether they are native or not, I know not. 'The 'timothy' of the middle States, here called 'herds grass,' I believe is said to be native. The terms of 'English grass, English hay, &e,' sound unpleasantly to my ears. (N. B. Everything in this state better than common, except politics, is called English. In Virginia, their celebrated mocking-bird I have heard called the English mocking-bird, to distinguish it from an inferior bird, called the French mocking-bird: neither bird being known in France or Great Britain.) All kinds of cattle, horses, oxen and sheep; and reserve their dung for top dressing in the will live on salt hay; but it must be said in jest, that is worth as much as this English hay; stagecoach-horses, whose chief dependence is on their corn, the object of giving them long food being chiefly to keep their food from being too concentrated, will live on it very well, no doubt; and on ways from the barn yard in the autumn and used tention to natural history. It would neither be time barley straw, a good deal better. It seems there is as top dressing on their grass land; not on the lost, nor uselessly employed. The objections to it a difference between the 'red clover' of the South- whole a had method, as their land is wet and rocky, are of little weight or real value. The industrious ern and the Eastern States. In what do they dif- and they must top dress it all they can, from the and enterprising farmer has often to bear severe

and soil, or distinct grasses? I last year saw (1 of sea weed; it being frequently strewed at th state it, as doubts are entertained of its success,) rate of twenty tons to the acre, when it is first hau a quarter of an acre of wet, cold land (where it ed. Sea weed is a most exciting and penetrating does not belong,) covered with a good crop of 'lu-manure, injures the flavor of vegetables, and give cerne,' belonging to a respectable mechanic of a bright green burnish to grass. It is of no per this town. He told me that he had sowed five manent benefit to the soil. pounds of it, with his barley, the year before (it is As to grain's going through animals unbroke stated that 'lucerne' takes some time to get its full and uninjured; it has been recommended, time strength,) in the ordinary way; that his cattle and again, not to give horses grain unbroken o showed an extreme relish for it, in preference to this account. the 'timothy' and 'red clover' in the same field. | Quarc .- which is most in fault, the horse's jaw Lucerne' is, I believe, the oldest grass in history, or his stomach? This does not apply to old horses and was grown by the Romans, Carthagenians, who cannot masticate comfortably from a cause pe Egyptians, &c. If it will succeed in New England, culiar to the horse. it will certainly be an era in our agriculture, barring one objection. A grass that will not care for honor to address you, in which I alluded to th our drought, that will require less labor in successi Durham cattle. The want of a correct agricultur sive renewings, and will unite the advantages of all vocabulary I take to be agreed to upon all hands a full crop to the nutritionsness of an upland grass, The printer amongst other typographical errors is to be desired; but I am told that lucerne does attributable to my bad handwriting, has convert not grow to advantage except on rich land. Now, ed the term 'blood horses' into 'long horned' oxen upland in the Eastern parts of New England, is I intended to say that the term 'blood stock apt to be barren: as to which point, I do not could not be applied to the Durham cattle: in the agree with the opinion expressed in the able address first place, because they do not deserve it; they of Mr Phinney, that all of our upland was once not being decidedly the best breed, for which covered with a rich soil; or something to that of will refer you to the accounts of English cattle feet. There is great foundation, no doubt, for say- shows for the last ten years; in which it will be ing so. I think it exceedingly probable that much seen, that the Herefords have equalled or excelled of such soils, probably the first tilled, was worked them. In the second place, because their attri till it was exhausted; and from our process of butes are the exact opposite of those of 'blood growing Indian corn, and desert it without cov- horses.' The thorough-bred horse has been bree cring it with anything but weeds, much of its ori- for his muscular strength and his speed; he come ginal goodness has been lost; and that what was to his growth late; is originally of small size once an effect, is now a cause. I have also no possesses extreme delicacy and concentratedness doubt that by his method of treating it, it could be of organization; and all the other peculiarities of rendered productive, with the addition of one op- an animal indigenous to a burning climate and an eration: that is, planting belts of firs; spruces are wrid soil: and is supposed, with some degree of the handsomest, if they will grow on such land; reason, to be wholly unmixed and original. The larches appear to grow here, in poor cold ground, Durham ox (though traceable to Holland, a wet very naturally, (but would be of no use a great cold climate, with a rank vegetation,) is chiefly a part of the year,) of considerable depth of column, artificial animal. The English short horn of 1831 on the Northwestern and Northern sides. I have is not that of 1821; he has been bred chiefly to known the white pine to make an almost impene- be euten; to come to his growth quick; fatten ex trable wood, of considerable height in twentyfive uberautly; to dislike motion; and to be the larg years, on land originally covered with white oak, est ox in the world. While on this subject, I From what I see immediately before me, it does will mention that there is a Durham steer in this not want to come in on maple and beech land: the vicinity, originally bred by the breeder of the yellow pine grows unmixed with the white pine ; but the pitch pine, the larch and white pine will to reach the same size. Columbus is not a shortgrow up together: where it is wet, the hemlock; horn; but chiefly of our English imported breed; and all this on tolerably good land, if it be pas- not known what, in particular. I observe in the

It is impossible (in allusion to the quotation concerning top dressing,) yet awhile, to persuade the laborers of this district, that dung cannot be ploughed in too soon: it is consequently intentionally left to be thoroughly dried by the sun, and the Scythian devastations of our northwesterly winds, as it is made, as much as possible; with the additional advantage of the process being insured by the assistance of the poultry of the farm. It is also a practice with some to break up their land in the autumn, spring, for fear the juices should run through the soil. In my immediate vicinity, however, that is, in the town of Rye, a most productive and well-farmed town, the soil is almost wholly manured with kelp and rock weed; and the dung is taken al-

fer? are they the same grass, altered by climate labor of working it. They have also abundance

Now as to a communication I did myself the great ox Columbus, who is considered to bid fair late tour of an English agriculturist in the North of Germany, that he states that he had seen no such specimens of the Durham cattle in his own country, as he was shown there; the bulls of vast size; being six feet high and ten feet long,

FOR THE NEW ENGLAND FARMER.

IMPORTANCE OF BOTANICAL KNOW-LEDGE.

Mr Fessenden-Struck with the remarks on the 'Importance of Correct Names,' in regard to plants mentioned in the New England Farmer, (and these remarks hold good in respect to many of our books and periodicals on agriculture and the like,) I would through your paper recommend a general atwrong causes the failure of his crops. The gar- juiceless, dener, imbibling erroneous notions, with his profesparterres. A knowledge of plants, and of the inthe grasses, no wonder that so many mistakes exist and these, too, may be of a very serious characer. Wordless weeds bear the tonorable names before? of valuable grasses; and valuable grasses are liable obe dishonored and debased by their wretched ocal appellations. As an illustration of this posiion, the communication of your Philadelphia 'Inmirer' in your last No, may be cited. In answer o his inquiry concerning 'red top,' the botanical name is 'Agrostis vulgaris' and that of white cript.

Mr Gilbert White in his 'Natural History of Selorne,' has the following excellent remarks, which re much to the present purpose,-The standing bjection to Botany has always been, that it is a ursuit that annies the fancy and exercises the emory, without improving the mind or advancing al knowledge, and where the science is carried o farther than a more systematic classification, the targe is but too true. But the botanist that is esirous of wiping off this assersion should be by means content with a list of names; he should udy plants philosophically, investigate the laws of getation: should examine the powers and virtues efficacious plants; should promote their cultivaon, and graft the gardener, the planter, and the isbandman on the phytologist. Not that system by any meens to be thrown aside; without system e field of nature would be a pathless wilderess-but system should be subservient to, not the ain object of pursuit,

Vegetation is highly worthy of our attention, d in itself is of the utmost consequence to manad, and productive of many of the greatest comts and elegances of life. To plants, we owe aber, bread, beer, honey, wine, oil, linen, cotton, e, what not only strengthens our hearts, and exirates our spirits, but what secures us from the elemencies of weather, and adorns our persons. in in his true state of nature, seems to be subted by spontaneous vegetation; in middle climes tere grasses prevail, he mixes some animal food th the produce of the field and garden; and it is vards the polar system only that like his kindred ars and wolves, he gorges bimself with flesh one, and is driven to what hunger has never own to compel the very beast-to prevupon own species. The productions of vegetation ve had a vast influence on the commerce of nans, and have been the great promoters of naviion, as may be seen in the articles of sugar, tea. aceo, opium, ginseng, betel, pepper, &c. As ery climate has its peculiar produce, our natural ints bring on a mutual intercourse, so that by the ans of trade, each distant part is supplied with the with of every latitude. But without the knowge of plants and their culture, we must have en content with our hips and haws, without en-

losses through ignorance, and as often attributes to mor the succulent and mutritive from the dry and to a current of air on the neck, which would have

The study of grasses would be of great consesion, oftentimes in his zeal to improve, unsparingly quence to a northerly and grazing kingdom, peded the circulation and cause the swelling on the destroys the very guardians of his borders and The Boranist that could improve the sward at the side, -or the borse might have been in a high stincts of animals, birds and insects, however slight, ber of society: to raise a thick turf on a naked action by his labor, and during his week's rest, from s by no means useless. Owing to the miserable soil, would be worth volumes of systematic some extraneous cause, in its return to its uniform local nomenclature of plants, and especially of knowledge; and he would be the best common-state, different parts would be differently affected, R-1.

Cambridge, Feb. 14, 1831.

FOR THE NEW ENGLAND PARMER.

TUMORS IN HORSES.

Mr Fessenben-Indolent tumors of much the same kind as those referred to by your correspondent 'B.' page 234 of your valuable paper have been of so frequent occurrence in this county, the past season, as to lead to the reasonable supposition that the disorder might be an epidemic.

The swelling usually commences on the glands of the neck, just back of the jaw bone, extending in many cases from the wind pipe to the mane. and from six to twelve inches down the neck towards the body.

Perhaps over an hundred cases have occurred under my own observation, since the first of May last. All of them, when recent, have readily yielded to copious bleeding either in the nose or neck, and thorough hand rubbing of the part affected,-and here I may be permitted to suggest that in this operation the hand should be slowly moved, with considerable pressure, in the direction that the hair lies, and for a distance above and below the diseased point. A light and rapid motion of the hand is of no benefit, and a rapid motion with pressure is liable to burst the delicate blood vessels already to greatly distended.

By the course above suggested the humors are gradually passed from the extended vessels, without injury, and forced into the general circulation of the system and are thus entirely removed from the diseased part. In a few instances I have directed a saturated solution of opium in alcohol to be used as an external application, and in one obstinate case of long standing an alcoholic tineture of cantharides

It is a difficult matter to prescribe from a description of the disease, but I have no doubt that the swelling referred to by 'B'-upon the side of his horse, might have been at once reduced if taken in season, by bleeding from the nearest vein or even by copious bleeding from the neck.

Your correspondent says he has kept his horse warm, warmed his drink, physicked him, &c. Would not it have been better for the horse had he kept him as before, given him his usual feed and required of him his ordinary work. A more regular and vigorous circulation throughout his system would in that case have been kept up, and the chance that the tumor should pass off would have been greater, (especially if the part had been judicionsly rubbed) precisely in the same way that horses subject to grease are in many cases entirely cured by regular service,

The cause of the disorder it is difficult precisely ing the delicate fruits of India, and the saluti- to point out. I once had an elegant horse ruined ous drugs of Peru. Of all sorts of vegetation by being placed, when warm, by an hostler in a grasses seem to be most neglected; neither the stable where was a window through which there mer nor the grazer seem to distinguish the annual was a strong draught of air—as he said, to cook m the perennial, the hardy from the tender, 'B.'s' horse might have been exposed when warm

a tendency to cause a swelling of the glands. The girths might have been too tight and thus imdistrict where he lived, would be an useful mem- condition; his system would be called into great wealth's man that could occasion the growth of -at any rate every person who has ever taken a two blades of grass where one alone was seen horse little accustomed to service and put him to severe work, has found him extremely subject to be annoyed by swellings and light tumors on various parts, especially when touched by the harness. In such cases the application of either cold or warm water, with hand rubbing, if the horse is kent at work, will readily effect a cure.

Southington, Con. Feb. 14, 1831.

P. S. In the bleeding of horses, no ligature should be applied to the neek, at least until after the incision is made; as much injury is frequently done by the great pressure of the blood in the veins of the head, and the neck is liable to swell. The incision should be large, and the flow of blood accelerated by giving the horse ears of Indian corn to eat as soon as the blood begins to run.

PRESERVED RHUBARB.

Mr Fessenden-Knowing that you are an admirer of the 'Tart Rhubarb' or Pie Plant I take the liberty to send you a small quantity of it which I preserved, by way of experiment, in sugar. It may be a new thing, and it may have been done by many others before; but however that may be, I will endeavor to communicate to you my mode of proceeding.

A quantity of leaf stalks were gathered and dressed in the usual manner, which (by way of hint to those who are unacquainted with the management of this valuable plant,) is to take hold of the stalk just below the leaf, and with a sudden jerk of the hand separate it from the crown of the root-this is apparently a very rash mode of proceeding; but it is much better then to use a knife. Cut off the leaf, strip off the bark, and cut the stalks transversely into pieces of about three fourths of an inch long-this having been done, I spread it in the sun to dry-when it was diminished about one half in bulk, I took half its weight in sugar, of which I made a syrup, into which I put the Rhubarb, half dried, as it was, and let it remain some time over a slow fire-after which I put it into a china pot which was filled almost to the top. When cold I poured a little brandy over it, to prevent it from moulding; stopped it tight and set it in a cool cellar, where it kept perfectly well.

You will perceive that it is a little bitter, which is owing to its having been done a little too late in the season; and here I would offer another hint .- The 'Pie plant' is always best when in the most vigorous growth, and the person who gathers it should take particular care to pick the leaves last grown-for a few days' standing, after they have completed their growth, renders them tough and bitter,-The want of this precaution is probably one of the greatest reasons why new beginners are not so likely to relish it.

I have been induced to be thus particular, from the circumstance of my own experience on the subject-for I have cultivated and used the Rheum Undulatum at least seven years, and during that period I have been gaining by degrees the very

small amount of information I now possess on the subject. Yours, truly,

Newton, Feb. 17, 1831.

The article referred to above is very palatable, and we doubt not wholesome, as it probably partakes in some degree of the medical qualities of all the plants of that species. Mr Pettee will accept of our thanks for the donation, and his description of the mode in which it was manufactured. It will prove a valuable acquisition to our dietetic articles. - Editor.

MEN BAGGAMD FARMER.

BOSTON, WEDNESDAY EVENING, FCB. 23, 1831.

POULTRY .- BY THE EDITOR.

Under this head we shall include hens, geese, ducks, and turkeys, and give a few practical observations with regard to each,

The duughill cock and hen (Phasianus gallus) is a native of the warm countries of the east, is orly in great repute, but is now nearly lost. It is found wild in many parts of Asia, and is domesticaand rural economy have made any progress.

The varieties of this bird, which, according to

Loudon, are known in Great Britain are-The common dunghill cock and hen—middle size,

of every color, and hardy. The game cock and hen-rather small in size, delicate in limb, color generally red or brown; flesh white, and superior to that of any other variety for richness and delicacy of flavor; eggs small, fine shaped and extremely delicate; the chickens are difficult to rear from their pugnacity of disposition. The game cock has long been in use to gratify a depraved taste for a barbarous amusement. London says, however, that this sort of sport is not so much in vogue, as it has been in Great Britain; and we do not know that it has ever been much practised in New England.

The Dorking cock and hen .- This is named from a town in Surry, (Eng.) It is the largest variety; shape handsome, body long and capacions, legs short, five claws on each foot; eggs large, and lays abundantly; color of the flesh inclining to yellowish or ivory. Both hens and cocks often made into capons.

The Poland coek and hen were originally imported from Holland. The color shining black, with white tops on the head of both cock and hen; head flat, surmounted by a fleshy protuberance, out of which spring the crown feathers. Their form plump and deep, legs short with five claws, lay abundantly, are less inclined to set than any other breed; they fatten quickly and are more juicy and rich than the Dorking. This is one of the most useful varieties. There is an ornamental subvariety, known as the golden Poland, with yellow and black plumage.

the above, of Dutch origin; they are of smaller which were upon an equality with the rest of the ed with warm water, and quickly replaced, less size, and said to be great layers. Their tops are stock. Yellow legged towls are fren of a tender they adhere to the hen and be drawn out of large and should be periodically clipped near the constitution, and always interior in the quality of the nest; if necessary the hen's feathers may also eyes, otherwise, according to Mowbray, they will their flesh, which is of a loose flabby texture and be washed, but always with warm water. grow into the eyes of the fewls and render them ordinary flavor, very subject to alarm.

for chickens, when small ones are not otherwise to hons, and even to his offspring. Hens above the be had. They are also particularly useful for set- common size of their respective varieties are by ting upon the eggs of partridges and pheasants, be- no means preferable either as layers or sitters. ing good nurses as well as good layers. There are The indications of old age are paleness of the two varieties of this breed, of which the more combs and gdis, dulness of color, and a sort of common is remarkable for having the legs and downy stiffness of the feathers, and length and feet furnished with feathers. The other and more size of talons, the scales upon the legs becoming scarce variety is even smaller; and is most elegant- large and prominent, ly formed, as well as most delicately limbed. bright stands pre-eminent.

The Shackbag or Duke of Leeds' breed was form- January. for the turkey,

tween the Dorking and Spanish breed, also to be adapted for capons.

The foregoing, according to English authors, we have observed considerable differences in their pany of the cock; of course such eggs are barren. forms, as well as in their habits. Some kinds have be glad to obtain and communicate information relative to the best breeds of fowls, as we have no doubt there is as marked a difference in the on the kind selected for rearing.

"The health of fowls is observable in the fresh valued chiefly for its grotesque figure and delicate and dryness of the eyes; the nostrils being free small, and as smooth legged as a game fewl, plumage, The most useful cock is generally a believe Mr Toohey has produced the first Asparavenient, as they may always be used as substitutes in his fits of passion, if not well watched, to his past.

The number of hers to one cock should be There is a society of funciers of this breed, who from four to six, the latter being the extreme numrear them, for prizes, among whom Sir John Se-ther with a view to make the utmost advantage. Ten and even twelve have formerly been allowed to one The Chitagong or Malay hen is an Indian breed, leock, but the produce of eggs and chickens, unand the largest variety of the species. They are der such an arrangement will seldom equal that in color, stricted yellow and dark brown, long to be obtained from the smaller number of hens. necked, serpent headed, and high upon the leg; Every one is aware that the spring is the best their flesh dark, coarse, and chiefly adapted to season to commence breeding with poultry, and soup. They are good layers, and being well fed in truth it scarcely matters how early, presupposproduce large, substantial and untritive eggs; but ing the best food, accommodation and attendance, these birds are too long legged to be steady sitters, under which the hens may be suffered to sit in

The conduct of the cock towards his hens is sometimes to be met with at Wokingham, in generally of the kindest description and sometimes ted in every country, where the arts of agriculture Berkshire, and is so large and the flesh so white, as in the Polish breed so much so as to be quite firm and fine as to afford a convenient substitute incredible to those who have not witnessed it. It is not an uncommon occurrence, however, for The improved Spanish cock and hen is a cross be-the cock to take an antipathy to some individual hen; when it continues for any length of time it found in and about Wokingham. It is a large is best to remove her, and supply her place by bird with black plumage, white and delicate flesh, another, taking care that the stranger be not worthe largest eggs of any British variety, and well ried by the hens. Spare coops or houses will be found useful on such occasions.

In making the nests, short and soft straw is to are the principal breeds of the gallus, or cock and be preferred, because the straw being long, the hen species which are known in Great Britain, hen on leaving her nest, will be liable to draw it We are not able to say what varieties of this useful out with her claws, and with it the eggs. The bird have been introduced into this country, but here it is ascertained will lay eggs without the com-

Eggs for setting should never exceed the age of a greater propensity to ramble, and to dig up a month, newer to be preferred, as nearly of a size seeds, and injure vegetables in gardens, &c, than as possible, and of the full middle size; void of other varieties of the same species. We should the circular flaw, which indicates the double yolk, generally improductive, nor should there be any roughness or cracks in the shells. The number of eggs according to the size of the hen from breeds of hens, as in those of swine or neat cat- nine to fifteen, an odd number being preferable, tle, and the profits of poultry must depend much in the supposition of their lying more close. The eggs to be marked with a pen and ink and exam-BREEDING .- Loudon says 'It should be a general | incd when the hen leaves her nest, in order to derule to breed from young stock; a two year old teet any fresh ones which she may have laid, and cock and pullets in their second year. Pullets in which should be immediately taken from her, as their first year, if early birds, will, indeed, probably they, if hatched at all, would be hatched too late bay as many eggs as ever after; but the eggs are for the brood. It is taken for granted that the small, and such young hens are unsteady sitters, hox and nest have been made perfectly clean for Hens are in their prime at three years of age, and the reception of the hen, and that a new nest decline after five, whence, generally it is not pro- has not been sluggishly or sluttishly thrown upon fitable to keep them after that period, with the ex- the old one, from the filth of which vermin are ception of those of capital qualifications. To be continued.

Early Asparagus .- Mr Roderick Tooliey, gar-The buntan cock and hen is a small Indian breed, and florid color of the comb, and the brightness dener at Gov. Gore's place, has sent to the office of the New England Farmer, several bunches of flesh. Mowbray mentions a subvariety extremely from any discharge, and the healthy gloss of the Asparagus of good size and fine appearance.—We From their size and delicacy they are very con-bold, active and savage bird, cruel and destructive gus that has appeared in Boston, for several years

TO HYPOCHONDRIACS.

To be always considering + what we should cut, and what we should drink, and wherewithal we should be elathed,' in order to avoid the approach of disease, is the most likely means to provoke its attack. A man who is continually feeling his pulse is never likely to have a good one. If he swallow his food from the same motive as he does his physic, it will neither be enjoyed nor digested so well, as if he are it in obedience to the dictates of an uncalculating appetite,

The hypochondriac who is in the habit of weighing his meals, will generally find that they lie heavy on his stomach. If he take a walk or ride with no other view than to pick up health, he will seldom meet with it on the road,

Nothing surely can be more idle and absurd, than to waste the whole of our being in endeavors to preserve it, to neglect the purposes, in order to protract the period of our existence.

L. M. Wheaton, Esq. of Norton, recently killed an ox weighing 1282 lbs,-tallow 150.

Several communications are received, and will soon appear.

Massachusetts Horticultural Society.

A stated meeting of the Massachusetts Horticultural Society will be held on Saturday, March 5 next, at 10 o'clock, at the Society's Hall.

ROBERT L. EMMONS. Feb. 23. Rec. Sec'u.

North Devon Bull.

A thorough full-blood Bull of this breed, eight years old in May next, which was imported from England by John Prince, Esq, at large cost, is offered for sale or to let on fair terms This breed are always of a mahogany red color, and having no white except the tip of the tail are easily mached; -considered the smartest working cattle in England; are easy to fat, and considered good milkers :- they probably combine the three qualities, as well as any known. Young stock of his getting may be seen at Sandwich, N. H. and Westminster, Vt. Apply Apply to John B. Russell, (post paid) office of the New England Farmer, Boston. Feb. 23.

Insect Transformations.

This day published by Lilly & Wait, (late Wells and Lilly.) Part 1st of volume 6, Library of Entertaining Knowledge, illustrated with beautiful engravings on wood, by Bowen.

'To the Farmer, as well as to the Naturalist, and all who love to search into the my-terious and beautiful operations of nature, the volumes upon Insect Architecture and Transformations, will prove uousually interesting Interesting to all, but to the agriculturalist particularly useful, in enabling him to understand the origin and the character of those numerous insects that blight the expected harvest, and nip his promised fruits in the green tree and in the bud. Teaching him where such ravages may be provided against, and where they must be submitted to, as the unavoidable dispensations of Providence."

. The Elephant,' is in a state of forwardness, and another interesting part upon Biography, with heads of Barry, and of Sir Richard Arkwright, in preparation. Feb. 23,

White Mulberry Trees.

Gentlemen in want of these plants, can have them, two years old, in any quantity not less than 100. Luthfully packed in moss, at 5 dolls, per hundred, by sending their orders to J. B. Russell's Seed store, No. 52 North Market street, Boston. Feb. 23.

Early Potatoes.

For sale by SAMUEL POND, near the Universalist Meeting House, Cambridgeport, a few bushels of his prime, early Potatoes, which took the premium at the Massachusetts Horticultural Society's Shows last season; and are considered the earliest variety to this vicinity.

Also, a fine milch COW, with her calf; a superior animal as a milker, and perfectly gentle. Feb. 23.

Cow for Sale,

For sale a good Cow, 6 years old, got by Cœlebs, with calf by Mr Welles' Durham Short Horn Bull. Price 40 dolls. Apply to J. B. Russell, (post paid). Feb. 23.

Farmer Wanted.

A single or married man is wanted to manage a farm a very pleasant village about 45 miles from Boston. He must thoroughly understand his business; be acquainted with marketing, and produce the best recommendations as to his industry and filelity. Address I. B. Russell, Seedsman, Boston, (post paid).

Cow Cubbage,

Just received, at the Seed Store, No. 52 North Market street, from London a small quantity of Seed of the Cow Cabbage; it is thought that no plant cultivated in this country will give so much folder from the same space of ground, for Milch Cows, as this It has been successfully cultivated to a large extent in New England and the Middle States the past year, and promises to be a great acqui-

Silk Red.

These useful machines may be had of the subscriber for the low price of \$25 each. By the help of this reel, the silk threads may be extracted from the cocoon with evenness and rapidity. It is the same for which I received the premium of the Massachusetts Agricultural Society, and has been a considerable time in use.

Dedham, Mass. Jan. 25, 1831.

[CERTIFICATE.] 1, Edward Brown, of Ashford, Con. late of London, England, silk manufacturer, do hereby certify, that I have used a considerable quantity of raw silk reeled in the filature of Jonathan H. Cobb, of Dedham, Mass.; that 1 find the silk rected by him equal to the Italian or China silk, and is capable of being used in the manufacture of any description of silk goods. I further certify the trimnungs for a suit of curtains now in the house of Hon. Datael Webster, of Boston, was made of raw silk raised and recled by said Jonathan H. Cubb.

Ashford, Ct. Jan. 15, 1831. EDWARD BROWN.

White Mulberry Seed.

For sale at the Seed Store connected with the New England Farmer, 52 North Market street-

A small quantity of fresh White Mulberry Seed, of the growth of 1830. Gentlemen in want of this Seed that can be depended upon, are advised to apply soon, as the supply here, and throughout the country, is uncommonly small.—Short directions for its culture furnished gratis with the seed.

Ammunition 3

Of the best quality and lowest prices, for sporting—constantly for sale at COPELAND'S POWDER STORE, 65 Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be refunded. If Jan. 7.

Farm to Let.

To be leased, for the term of five years, or less, a small Farm in Andover, and within four miles of Lowell. A good place for the raising of vegetables for the Lowell HOBART CLARK. Market. Inquire of Andover, Jan. 15, 1831. Jan. 21.

The public are respectfully informed that sundry perons, lost to a sense of honor and regardless of the lives of the community, have offered and do continue to offer for sale an article purporting to be 'Dr Moore's Essence of Life,' but which does not even approach an imitation -the hills of Directions have the same caption-enumeration of diseases and certificates as former bills enclosing the genuine article, but the list of agents is not the same. The individual against whom 1 would most particularly guar I the public, is Benjamin F. Simpson, of Chester, N.

II. This man has sold to sundry persons in the city of Boston the spurious article—to some individuals he has given his own name, to others he has called his name Moore-to one person he sold a parcel of his article, and affixed the signature of Ebenezer G. Moore-to his bill of sale to another person he represented himself as my brother, and claimed an equal right with myself to man-ufacture and yead 'Moore's Essence of Life.' I should not have noticed Mr Simpson it certain deale s in Medicine were not in the habit of receiving from him and palming upon country traders the spurious article-whether their object is gain, or a wish to injure the reputation of the genuine Moore's Essence, and thereby introduce articles of their own composition, I know not—this much I do know, the reputation of 'Dr Moore's Essence of Life' is too firmly established to be overthrown by the concentrated efforts of spurious dealers. I have long known of the circulation of the pretended imitation, and have suffered it to pass unnoticed, but the duty I owe the public, my aged father, and myself, requires this exposi-JOHN S. MOORE. Feb. 23.

Grass Seeds, Sc.

For sale at the Seed Store connected with the New England Farmer, 52 North Market street-

A lew bushels of genuine Fowl Meadow Grass Seed, raised in New Hampshire expressly for this establishment: also, Lucerne, Red and White Clover, Tall Mealow Oats Grass, (raised for us by Mr Phinxey,) Herds Grass, Red Top, Orchard Grass, (raised for us by Mr Noves,) Hemp Seed, Flax Seed, Broom Corn, &c; all of the very first quality.

BRIGHTON MARKET-Monday, Feb. 21. [Reported for the Chronicle and Patriot.]

At market this day, 300 Beef Cattle, (including 44 upsold last week) 526 Sheep, and 230 Swine. All the Swine have been before reported. PRICES-Beef Cattle-A little quicker and a little

better than last Monday-about the same that they were two weeks since. We shall quote from \$3 84 to 4 84; a few yokes were taken at \$5, and one yoke at 5 25.

Sheep-We noticed one lot taken at \$3 42, and two lots at 3.75; also a lot of about 90, unusually large and fat, but were not able to ascertain the exact price obtained for them, probably about \$6 each.

Swine-The only sale effected was one entire lot, to close, of 161, at about 4c; nothing doing at retail.

Wood .- Of the lot advertised by Warren, Barry, & Park on Friday, we notice the following sold :- 1100 lbs superior pulled Lambs, 55 te per lb cash; 1000 do Lambs, 34c per lb; 1000 do called Staple, 34c; 3100 do Merino pulled Lambs, 49c; 3400 do, unwashed, 35 a 36c per lb 6 nos. Private sales of about 5000 lbs Spanish Lambs, 55c per lb 6 mos .- Patriot.

MISCELLANY.

Miss Hamilton, in her book on education, gives a very remarkable proof that the memory of perception may be enjoyed in high perfection, where all the other faculties are defective. An ideot so ntterly destinte of the faculty of concention, as never to be capable of acquiring the use of speech, (though it did not appear that his organs either of speech or hearing, were at all defective) was for a great number of years confined to an apartment, where he was occassionally visited by his family and friends. In this apartment stood a clock, to the striking of which he evidently appeared very attentive, and it was the only sign of attention, which he ever displayed. Every time the clock struck, he made a clucking noise, in imitation of the sound; and this he he continued to do as often as he hour returned. After several years, the clock was removed; when, to the surprise of all, he continued, as the hour came, to make exactly the same noise. He was perfectly exact in the calculation of the time, and never missed an hour in the day or the night; nor did he ever cluck one too many, or too few. To the hour of his of time without the slightest variation!

In popular Essays, by the same writer, we find an anecdote which illustrates how completely the senses may be absorbed by intense attention to one object: 'a wounded officer, after having received all the assistance he could from the most able surgeons in London, still continued to suffer agonizing pain, and was finally obliged to quit the service and go home to his friends in the country. In this remote situation, he was attended by a very young practitioner, who declared his belief that a piece of the leather of the belt had been carried by the ball into the shoulder blade, from whence it might be extricated by an operation. Experienced surgeons, when consulted, rejected the idea; but the young man, worn out by suffering, at last consented to the operation. The surgeon, whose reputation was deeply interested in the event, performed it with complete success; and triumphantly producing the piece of leather began to compliment his patient for the fortitude he had displayed: 'I have not even heard you utter a groun,' said he. The attendants could not forbear smiling; for in fact, the poor suf ferer had uttered such piercing shrieks as to be heard for furlongs!

Doctor Warren in the course of his very interesting address on the subject of anatomy, mentioned one very remarkable case which had occurred under his own observation. A sailor on board of a U. S. ship fractured his skull, and the bone pressed in upon the brain. The result was total imbecility of mind, and fergetfulness of speech. After continuing in this helpless state of idiocy four years, trepanning was advised by Dr W. The bone had settled in, with such an uneven surface, that the use of the circular saw was extremely difficult and dangerous; however Dr until you saw the Angel? Warren deemed it the only alternative-either way, death seemed ready to seize the poor victim.

The experiment was tried with perfect success; and, wonderful to relate, upon the removal of the bone, his senses, and his speech returned! He wished the doctor a Happy New Year and for the first time in his life, said he had a right to apply for a pension .- Mass. Jour.

Biblical Lore .- At a recent discussion on some points in biblical history, it happened to be remarked that there was no account of the death of Eve. ' Nor of Adam either,' said one of the company. 'I beg your pardon,' replied a religious lady, 'if' you read your bible carefully, you will find it stated that Adam was guthered to his forefathers!

twins: Mrs Shoe, the wife of a shoemaker in Dover, January, 1831, was \$108,000. Among the articles

A Serious Reparted.—The Irish are very happy in their conversational tact, and the art of repartee. When an Irishman makes a blunder, he generally the sly humor it conveys. Their satire, however, in this city from Boston, with a large and general assortiss superior to their mirth. French may be the language of how was one will be superior to their mirth. guage of love, was once well observed. English of business, but Irish is the language of expression. There is no other language, German not excepted, that expresses so much meaning in a few words,-The Irish endeavor to translate this capacity into English, and to supply with dramatic effect the deficiency of expression. A Galway gentleman lately entered a coffee house in London, and called for tea; his brogue attracted the attention of a scented civilian in an opposite box, who, relying upon his superior accent, resolved to have a jest at the expense of the stranger. The civilian called for tea too; the Irishman called for muffins, so did the civilian; toast, milk, sugar, &c, were severally called for by the Irishinan, and as severally echood by the fop, who enjoyed in his corner the supposed embarrassment to which he was subjecting the Galway man. At last, with the greatest composure, and if possible a death he continued to give exact notice of the lapse richer brogue, the Irishman desired the waiter to DR KNAPP, have been cured within the year past of a bring up pistols for two,'-the jester's echo was si- bad rupture of 9 years' standing, by the use of one of lenced.—English paper.

> Mr Wilkes (in his juvenile days) going to Dolly's chop-house, accidentally seated himself near a rich and purse-proud citizen, who almost stunned him with roating for his stake, as he called out. Mr Wilkes, in the mean time, asking him some common question, received a very brutal answer; the steak coming at that instant, Mr Wilkes turned to his friend, saying, 'See the difference between the City and the Bear Garden; in the latter the bear is brought to the stake, but here the steak is brought to the bear.'

About the year 1500, a Chinese merchant opened a mine of precious stones. As soon as it was known the Emperor caused it to be shut with this observation: 'Uscless labor causes sterility; a mine of precious stones does not produce corn.

A Sailor belonging to a man of war, having been for his good behaviour promoted, from a fore-mast man to a boatswain, was ordered on shore by his Captain to receive his commission at the Admirality Office. Jack went accordingly; and thus described his reception afterwards to his companions: 'I bore away large, said he, for the Admirality-Office; and on entering the harbor I espied a dozen or two guill-drivers. I hailed' em ;-not a word said they. Hollo! again said I. Not a word said they. Shiver my top-sails, but what can this mean? said I. Then I took a guinea from my pocket, and holding it up to my peeper, Hollo; again said I. Oh! Hollo, returned they. So, so, my boys, cried I, you are like Balaam's ass, are you? You could not speak

Violent Courtship .- During the excesses of the Jacobin party in Paris, Schneider, who was Commissary of the French Government at Strasburgh, was distinguished by the atrocity of his actions. A Priest of the name of Funck having made his recantation, and taken the civic oaths, requested Schneider to find him a wife; he assembled the young women of Strasburgh, and addressed them in a speech, in which he declared, that whoever should refuse Citizen Funck for a husband, should be considered as a suspected person, and punished by the guillotine. The amorous Priest, of course, found a pretty wife.

The amount of property left in pledge with twelve An English paper thus announces the birth of pawn-brokers in New York during the year ending was, on the 9th inst. safely delivered of a pair of pledged, were no less than 120,000 garments, and Shoes. . Igricultural Warehouse and Seed Store,

ment of AGRICULTURAL IMPLEMENTS of the most approved kinds; with also a general and very extensive issortment of Grass, Garnen, Field, Flower and HERB SEEDS, which will be found to comprise a larger variety than has ever before been introduced into the Western country.

The above articles have been recently purchased from the well known Agricultural Establishment of Messrs NEWELL and RUSSELL, in Boston, and were selected by the subscriber himself, (who has been for several years engaged in the business) with great care. Those who may call at his Agricultural Warehouse, No. 23, Lower Market street, between Sycamore and Main streets, will be assured of finding every article wanted in the agricultural line, of a superior quality and at fair prices. S. C. PARKHURST.

Cincinnati, Jan. 1831.

Dr Hull's Patent Truss.

DR HULL, Sir-Under the advice and direction of your patent trusses. I had wo n various kinds of trusses before I got one of yours, but they were very burdensome to me. Your truss, on the contrary, is comfortable to wear, and as convenient to put off and on as a pair of spectacles. I were it not to exceed five months, and tound myself cure t. I have not had it on tor six months past, and have exerted myself violently at wrestling, jumping, riding, and other hard exercises without any return of the complaint, not even a feeling of weakness in the part. In fine, your truss has made me as sound and well as ever I was; it is one of the most valuable H. N. FISHBURN. inventions in the world. BALTIMORE, Jan. 1831.

Dr Hull's Trusses are sold by Eben. Wight, (sole agent for this city,) Milk-st. opposite Federal-st.

Veltow Locust Seed.

Just received and for sale at the Seed Store connected with the New England Farmer Office, No. 52 North Market Street,

A lew lbs. genuine Yellow Locust Seed, (Robinia pseudoacacia) saved near Harrisburg, Pa. expressly for this Establishment. The excellence of this tree for ship timber and fences, its rapid growth, and its beneficial effects on sandy, barren plains, where it thrives well, are too well known to require comment.

Durham Short Horns.

For sale, several of the pure breed, descendants of the celebrated animals presented by ADMIRAL SIR ISAAC COFFIN, to the Massachusetts Society for the Promotion of Agriculture. The pedigree of these animals can be given as far back as Hubback, who was calved in 1777. and is reputed the foundation of this much admired stock. Also, several Heifers bred from the same, of various grades, from half up to seven eighths blooded animals. For particulars, inquire of E. Hersey Derby, Salem. Salem, October, 1830.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a de-

No paper will be sent to a distance without payment being made in advance.

POLITICS FOR FARMERS.

Continued from page 242.

Manifactures or Corron. -These may be said to have fallen fifty per cent in price since the protection of the domestic manufacture of them : that is, fifty cents will purchase as much cotton sloths, shirtings, sheetings, calicoes, plaids, stripes and all the common articles for men and women's year, as one hundred cents would do, before our pound. ariff laws were enacted to encourage the domestic ndustry, and consume the domestic material. Whole ship-loads of East India cotton goods were nported into the United States-we now export American cotton goods to the East Judies! It is eadily admitted, though our opponents will add the present selling price is $2\frac{3}{3}$ cents per lb. nit nothing,") that a large part of this reduced rice is caused by improved machinery; but the et is no less true, that coarse cotton goods are eaper at Providence, in Rhode-Island, than at lanchester, in England. We speak understamigly; and the proof is at hand, that in England ev have counterfeited our marks to sell their pods for ours in South America. We have seen enty specimens of this trick. The poor cotton Surat was worked to imitate the strong upland tton of South Carolina, &c, thus to injure both r planters and manufacturers; but such frauds ve generally been soon discovered, in the superquality of our goods. Mr Ragnet has spoken the lax on these goods. We will assure him payment of 109,000 dollars a year, bonns, if shall obtain us the liberty to export them, free duty from England for five years-half a milof dollars, by way of purchasing his free le! We have friends who are ready for this eculation'—as things are at present.

The duty on such goods is 83 cents a square d; the cotton in them costs 21 cents, together , we buy them at eight cents the square yard ; n, if the duty be a tax, the manufacturer not v gives his labor for nothing, but pays a premiof 31 cents on every yard that the people kind enough to purchase of him! Such is reasoning of the 'free trade philosophers!'

he price of cotton goods is too low, by the nestic competition; but that must regulate it-The following little statement may show power of protection to produce competition, decline prices, as well as a volume of facts. 826 and 27, a sort of goods, well known as · Warren calicoes,' were worth 17 cents a l; the tariff of 1828 raised the duty, and they to 16; they were 15 in 1829, and now are 14. What an oppression is here!

uch is the case in respect to all and every ription of goods, the manufacture of which nave fairly ' taken hold of.' We speak withthe fear of contradiction. A reduced cost to umers has universally followed increased proin to manufactures.

HEMICAL PREPARATIONS .- All these have been ced at least 50 per cent in price, because of only a few leading articles.

as; a duty of 2,50 cents per cwt. was laid upon fore the duty was laid.

POLITIOA도 300回の風で。it by the tariff of 1824, and the present selling price is 3 l to 3 l cents per lb.

Glauber salts had a regular demand at 4 cents per lb .- 2 cents per lb, duty was levied by the tariff of 1824, and the present price is 2 cents per lb., the exact amount of the duty.

av quantity may now be had for 11 cents per and of superior quality.

Refined salt petre was from 12 to 14 cents per cents per lb, was put upon it-it soon fell to 9 South Carolina. The price of the article has cents and may now be had for 8 cents.

There is a duty on copperas of 2 cents per lb.

GLASS AND GLASS WARES, -Such window glass as sold for \$15 the 100 sq. feet in 1816-may now be had for 7 dollars and 50 cents, or one half the old price. Glass and glass wares genthey were before protection was extended to them and we are thankful that they were really proteeted. We buy as many tumblers for 50 cents as used to cost us 100.

Carlinet wares, &c .- We are told that, on all sorts of cabinet wares, the people are 'taxed' thirty dollars on every hundred of the cost, for \$3 on every cradle or table that costs \$10.'-So says Mr Raguet of the Banner of the Constitution! s also informs us, that chairs, hals, leather, and all its manufactures, such as boots, shoes, saddles, &c, with, indeed, almost all the products of mechanics, pay the same ' tax'-Now, what rogues must these mechanics be, seeing that from Balti- worth 20, and has been sold at 18, more, only, they have exported to foreign places, not less than five hundred thousand dollars worth of these articles in one year, to meet the competition of all the world, while they EXTORTED three the United States, dollars, on every ten, of the value of their products, sold at home! A leathern medal, with a suitable motto stamped on saw dust stiffened with glue, is worthy the man who thus exposes the swindlings of the mechanics! Some of the boys,' being upholsterers, might think that he deserved a coat of glue, sprinkled with feathers-but we hope that they will not bestow it! 'LET HIM ALONE! Let him wear his English coatunmolested-'a monument of the safety with which error of opinion [or perversion of facts] may be tolerated, when reason is left free to com-

MISCELLANEOUS.-We have already extended this essay much beyond the limits that we wished to assign for it-but the facts are so numerous and the subject so copious, that it was impracticable to condense them more than we have done-we shall therefore conclude with a few more specifications, as to the happy effects of the 'American System,' in reducing the price of commoditiesadding some general remarks.

Lead and all its manufactures, have been relomestic manufacture of them. We shall not duced much in value—the duty on pig lead is 3 duced much in value—the duty on pig lead is 3 with sand, LIME and continuous Nay, the very cents per lb—its price 3½ cents; the duty on shot granite rock on which the rails of the Baltimore and he old steady price of alum was from 5 to 6 is 4 cents, the price 5. It was 9 to 10 cents be-

Gunpowder was 45 cents per lb, and is 22 cents and less. The common as low as 19 or 12

Spirits of Turpestine was about 50 cents a gallon in 1823, now 30 cents.

"Cuphering states" were "taxed" with a duty Epson salts had a steady price of S cents per of $33\frac{7}{4}$ per cent, and they are now cheaper lb.; a duty of 5 cents was laid upon them, and by 331 per cent, than before that duty was levied,

Paper is a great and valuable manufacture the various business which old rags fornish is of b, before the tariff of 1824, when a duty of 3 a greater annual value than the cotton crops of declined about twenty per cent, though the duty upon it was much increased, and the quality has greatly improved by the domestic competition. The long list of 'taxes' on books of different sorts, is a string of nonsense.

Castor oil had an average price of more than three dollars a gallon previous to 1824, when it erally, are more than one half less the price that was 'taxed' with a duty of 40 cents per gallon, A large cultivation of the bean immediately followed, and the price fell to about 150 cents, except in 1828, when, because of a great demand for our oil in England, it rose to 275 cents per gallon, by which our farmers profited.

Fire bricks, in imitation of the English Stourbridge, and fully as good, are selling for 30 dollars a thousand. Before we made them ourselves, the British charged 70 dollars for them, are now kindly willing to take 30. But our own are preferred; to prevent future impositions.

Cotton bagging, before the tariff of 1824, averaged about 40 cents per yard—it is now hardly

The manufactures of hides and skins are worth at least, 30 millions a year, or 34 millions more than the great export of cotton last year from all

There are fifty minor articles that we might add, as fast as we might write them down. But it is enough. In what is the consumer taxed for the benefits of the manufacturer? Take the fire brick as an example. John Bull demanded and received of us \$70, for what he is willing to accept 30, since we began to make them for ourselves; foreign nations made us pay \$3 a gallon for castor oil, until we grew the bean on our own farms, and now it is worth only about \$11. What more is needed?

To be concluded next week

^{*} We mention this important article because it is in the vast catalogue of 'taxes,' and twice mentioned, that lately was published, and there are many of its class: such as 'bonnet wire,' 'braces.' or suspenders-' ehaffing dishes'- Cologne water,' currants for mince pies, dolls for children, 'haversacks,' mittens,' otto of 'dolfs for children, 'naversacks, inneres, one of roses,'-' pack thread' twice mentioned—'tooth powder,' spermaceti candles,' 'sweetmeats.' twice put down - 'toys,'- 'tubs,'- 'traps for rats and mice,'- 'vinegar' - wafers - walking sticks'- tooth brushes' and wigs' and hundreds of other contemptible things-a mere buggaboo to frighten the vulgar,-and disgraceful. Why were not horn spoons, tooth picks, tweazers, nailbrushes, corn cutters, whisker-patterns, shoe-strings-Ohio road are laid would be taxed-if-only if imported, according to the honorable statement before us.

COMMUNICATIONS.

FOR THE NEW ENGLAND LARMER.

LIVE FENCES.

Mr Fessenden-If you deem the following observations and extract on the subject of live fences deserving a place in your highly valuable paper, they are at your service.

I noticed a short time since at Brockline a hedge, and unable to resist any horned beast. of the Three Thorned Acacia of the extent of 100 rods, set 6 or 7 years since at the mansion lately the residence of John Tappan, Esq. of your city. This hedge has been annually pruned top and sides, and promises I think to become ere long a fence the most beautiful if not the most formidable of its kind.

This most hardy and thrifty tree is a species of the sensitive. Its beautiful pinnated leaves, regularly and daily contract and shut up at about the going down of the sun. This plant is neither devoured by the destructive worm, nor does it like most other species of the Locust throw up innumerable suckers from its root. Its numerous and branching thorus-growing sometimes more than a foot in length, have occasioned its being sometimes called by way of distinction the 'Horrid Acacia.'

The Red Cedar, although not armed with dreadful thorns as is the three-thorned acacia, yet I think bids fair to prove a valuable material for live fences. Its extreme hardiness, its beauty when considered as an evergreen, and its wood, bark and foliage being at the same time so offensive to both animals and insects, that neither have ever been known to devour them. The gentleman above named informs me of a hedge of the Red Cedar of considerable extent which he has oftimes noticed at the Insane Hospital near the city of New York. So perfect had this hedge been rendered by shearing-and so dense its surface, that it seemed scarce possible to discern a space where even a hand could be forced through its compact exterior

At Mount Vernon, we are informed by the Rev. Mr Colanan, are very extensive and beautiful hedges of the Red Cedar, These I understand by him to the top being now distributed among the are set in a single row. Judge Taylor has also branches. The next is that a tall hedge stagfrom his own experience highly recommended nates the air, and poisons both corn and grass hedges of Red Cedar.

One point with regard to hedges seems now to be pretty generally admitted, that in our climate a hedge will not succeed so well on the summit or outer angle of a bank of earth as on the level surface; on the outer angles of earth-banks the thorns that from space to space are allowed to droughts to which we are sometimes liable and a too powerful sun are destructively injurious.

I send you, Mr Editor, an extract on the subject of hedges from a writer of the 18th century; it is Lord Kaimes a writer well known as an eminently practical man. His mode of training and forming the hedge, as I have never seen it practised, I thence conclude is not generally known among us; yet, to my mind, there is no system that I have ever heard of, which has ever been devised, which promises to equal that which is here described for forming a strong and permanent hedge. Let the material consist of whatever tree it may, whether the White Thorn-the Acacia-the Virginia Thorn or the Cedar, the same system of management seems alike adapted to them all.

In training hedges (says Lord Kaimes) I have had the experience of three hedges trained twelve years as follows:

The first has been annually pruned, top and

The sides of the second have been pruned, but the top left entire.

The third was allowed to grow without any

The first is at present about four feet broad and thick from top to bottom; but weak in its stems

The second is strong in its stems, and close from top to bottom.

The third is also strong in its stems, but for two feet up bare of lateral branches, which have been destroyed by the overshadowing of those above, depriving them both of rain and air. That the secould is the best method is ascertained by experience; and that it ought to be so, will be evident from analogy; in the natural growth of a tree its trunk is proportioned to its height: lop off its head and it spreads laterally and becomes a bush, without rising in height or swelling in the trunk.

Hence the following method of training up a hedge which is to allow the thorns to grow withont applying a knife to their tops, till their stems be five or six inches in circumference. In good soil with careful weeding they will be of that size in ten or twelve years, and be fifteen feet high or upwards. The laterals only must [meanwhile] be attended to. Those next the ground must be pruned within two feet of the stem, those above must be made shorter and shorter, in proportion to their distance from the ground; and at five feet high they must be cut close to the stem, leaving all above full freedom of growth. By this dressing the hedge takes on the appearance of a very steep roof; and it ought to be kept in that form by pruning. This form gives free access to rain, sun and air; every twig has its share and the whole is preserved in vigor.

When the stems have arrived at their proper bulk, they are ent over [cut off] at five feet from the ground, where the lateral branches end; this answers two excellent purposes, the first is, to streng then the hedge, the sapthat formerly ascended

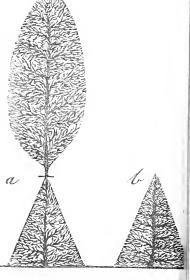

A hedge trained up in this manner is impenetrable even by a bull; be may press in the lateral branches, but the stems stand firm. I'or an instant proof that this method will answer, observe the grow up above their fellows in form of a hedge row. These thorns though growing in the middle of a bushy bedge have stems far larger than the rest. Besides the strength of such a hedge, it is less expensive than a hedge reared in the ordinary way; the weeds are sooner checked and it requires much less pruning, * * * * * *

* Good thorns, are indeed more essential in this mode of training than in any other; they ought to be the best thoras that can be procuredall of an equal size and equally vigorous, that luded to belongs to the same genus with the bott they may not overleap one another,

The thorn is a tree of long life, and a hedge raised and dressed in the way here described would continue a firm bedge for perhaps five hundred

Respectfully, your most obedient servant, WILLIAM KENRICK.

Newton, Feb. 16, 1831.

DESCRIPTION OF THE FIGURES.

Fig. a-Mole of pruoing the hedge till the stems become 5 or 6 inches in circumterence and at least 15 feet in height.

Fig b, represents the hedge when completed and topped .- It is now 4 feet wide at bottom and 5 feet high, in the form of a steep roof; in this form it must always be

FOR THE NEW ENGLAND FARMER.

INSECTS IN CATTLE.

Mr Fessenben-Some of my young cattle have small swellings under the skin near the back, containing worms which can in some instances be forced out by pressure of the thumbs and forefingers of both hands, through a small orifice on the most prominent part of the swelling; and are white, with a black or brown point at the head, and are about three fourths of an inch long, and nearly the same in the greatest circumference.

This is a common occurrence among young catthe in the spring of the year; and by our old farmers are called cattle worms, who notice them but little, saying they will all come out by pasture time. They are however a serious evil to the

If you, or any of your numerous and intelligent correspondents, can and will inform the public through the medium of your valuable paper the cause of their origin, and how that can be prevented, and the best method of extirpating them at this season, when so full grown, you will confor a great favor on that public, and many herds-Essex North.

Remarks by the Editor.—The insect above alin the horse, and is called by naturalists Oestrus bovis, or ox bott. It is thus described under the article ' Botts' in Rees' Cyclopedia,

'When young, the larva is smooth, white, and transparent; as it enlarges it becomes browner; and about the time it is full grown, it is totally of a deep brown color, having numerous dots on its surface, disposed in transverse interrupted lines

At certain seasons of the year the parent of this larva attacks neat cattle for the purpose of depositing its eggs beneath their hides; and 'although its effects on the cattle are so often remarked, yet the fly itself is rarely seen or taken, as the attempt would be attended with considerable danger, if the insect is in pursuit of the oxen. The pain inflicted in depositing its eggs appears to be very severe. When one of the cattle is attacked by the fly it is easily known by the extreme terror and agitation of the whole herd. The unfortunate object of the attack runs bellowing from among them to some distant part of the pasture or the nearest water. The tail from the severity of the pain is held with a tremulous motion straight from the body, and the head and neck stretched out to the utmost. The rest, from fear, generally follow to the water, or disperse to different parts of the field.

When the oxen are yoked to the plough, the attack of this fly is attended with danger to the Irivers; since they become perfectly uncontrollaple, and will often run with the plough directly orward through hedges, or whatever obstructs their

'There is provided on this account, to many doughs a contrivance to set them immediately at iberty. The singular scene attending the attack of this fly upon the herd has often been the subect of poetical description.' Virgil in his Georrics has given a beautiful sketch of the kind, which we have translated as follows.

Through waving groves, where Aino's torrent flows, And where the ilex in redundance grows, Myriads of insects flutter in the gloom, (Œstrus in Greece, Asvlus named at Rome)

Fierce and sonorous: By the borrid sound Driven from the woods and shady glens around, The universal herd in terror fly,

Their bellowing shakes the woods and rends the sky.

It is said that the strongest and healthiest beasts re preferred by this fly. Kirby and Spence afrm that 'though these insects terrify and tornent our cattle they do them no material injury. hey indeed occasion considerable tumors under he skin where the botts reside, varying in number com three or four to thirty or forty; but these sem unattended with any pain, and are so far from eing injurious that they are rather regarded as roofs of the goodness of the animal. The taners prefer those hides which have the greatest umber of bott-holes in them, which are always ie best and strongest."

FOR THE NEW ENGLAND FARMER.

LICE IN CATTLE.

Mr Fessengen-One of the great evils attendig young cattle during our long winters is their ptitude to become lonsy; the Durham short orns with black, and the native breed with red

The most sure and least dangerous method of estroying the race is, I believe, generally admit-

passing round the segments. Two distinct and ted to be, washing them with a strong decoction different kinds of lines are seen on each segment; or tobacco. At this inclement season of the year, the uppermost of them is narrower, and consists of that seems a very barsh, if not inhuman remedy; larger dots, underneath this there is a broader line, and mercurial ointment, I have proved to be a and the dets smaller. The first are easily seen by very unsafe one. If you, or any of your practiusing the lens to be real hooks, bent, upwards, or cal correspondents will have the goodness to state towards the tail of the insect; and on examining via your useful paper any more humane, safe and the broader line of small dots, with a tolerably reflicious method of destroying these vermin during powerful magnifier they were found also to be real the cold season, as also any means during the fall hooks turned in an opposite direction to the former, and early part of the winter to be used as prophytactics you will oblige many farmers in

Feb. 19, 1831. Essex North.

Remarks by the Editor.—A writer for the New England Farmer whose communication was published vol. i. p. 307, gives the following method of destroying Vermin on Cattle.

I have found that a strong decoction of tobacco washed over a beast infested with vermin will generally drive them away; it sometimes makes the beast very sick a short time,

But a better way is to mix plenty of strong neck of the creature with it, which will effectually give them air, and let the honey run off. But kill or drive away all vermin from a quadruped.

Mr John Lane Boylston, in a communication. published, New England Farmer, vol. viii. p. 19. recommends white washing the interior of barns, stables, &c, as a remedy for lice in cattle; and likewise advises 'shearing the ears and between the horns, in the fall before they are put up to bay,' He says, in white washing no salt must be used, as is usual in the outside of buildings, lest the cattle should lick it off. The same gentleman (who is a practical as well as a scientific cultivator) approves highly of the practice of earding cattle in the winter, after they are put up to hay,

TO PREVENT SOWS DESTROYING THEIR OFFSPRING.

MR Fessenden-The vexatious propensity of many sows to devour their young offspring, immediately after their birth, is well known. I have never seen in the New England Farmer, nor heard of, an effectual preventive. I trust, however, one has at last been found. Last summer a vessel arrived at Long wharf, in this city, having the wharf, produced a fine litter of pigs,-She very soon began to devour them, upon which the captain threw her several pieces of salt pork, which she are greedily, and disturbed the pigs no more. The captain, who was formerly an experienced farmer as well as sea captain, said he had often tried the experiment, and always with perfect success. This may, or may not, be new to your readers. To me it appears very important. Yours truly,

Boston, March 1, 1831.

AGRICULTURAL PREMIUMS.

Mr Editor-I wish to ask through the medium of the New England Farmer if the Trustees of the Massachusetts Agricultural Society have struck from their list of agricultural products for a premium, the article 'Spring Wheat' for the year 1831? Also 'WINTER RYE'? As I consider these products among the first to advance the interests of Agriculture, I have thought it may have been a mistake in the printer in omitting their mention in the list as published in the last Repository and Journal, No. 3, Vol. X .- An answer to these questions will be gratifying to

February 25, 1831. A COUNTRYMAN. FOR THE NEW ENGLAND PARMER.

BEES.

Mr. Fessenben-I had on the 16th day of last January a swarm of bees which melted down, so that one third of the honey ran out, and half the swarm was drowned in the honey. The weight was fortyeight pounds, honey and bees, and the hive was thirteen inches by eighteen. The thermometer stood about ten degrees below freezing, and the hive was out in the open air, exposed to the weather. The entrance to the hive was lightly fastened up to keep the bees from coming out on the snow. They had been fastened up one day, when the event happened. It was first discovered by the honey's running out and falling on another hive, which stood underneath; and on opening the hive the steam ascended from it, as it would from a boiling pot; and the bees made all possible speed to leave the hive, but were so immersed in the honey that they could not fly, and a great many were lost on the snow. I soon stopped them up, scotch snuff in train oil, and rub the back and and bored some holes in the bottom of the hive to there had so many bees fallen down, that they clogged up the holes. I then took up the bottom board, and put the bees into a box six inches deep, so as to see what state they were in. A good deal of the dry comb in the hive fell down, and it has been so melted that it is now in many crooked shapes. I have since carried the hive to Brighton, and while removing it (which happened to be during a snow storm) I noticed that as fast as the snow fell, it melted on the hive by the heat of the bees within, although it was a very cold day.

I have some other hot natured bees, so hot as to melt the snow away from the hive two inches, but not so hot as to melt down the honeycomb, I wish to publish this, for to me the above occurrence is unaccountable. It is a thing which has never happened to a swarm of bees in my possession be-

I should consider it a great favor if some one would through the medium of your paper, state the probable eauses of this great heat, proceeding from bees, and how they have the power of creating it, so as to melt their comb at any time they on board a sow which, very soon after reaching please. I have conjectured myself the cause, but should like that some one older than I am in the management of bees, should inform the public the cause of this new phenomenon.

EBENEZER BEARD.

Brighton, March 1, 1831.

MILCH COWS.

MR Fessenden-lam making arrangements to keep a dairy stock of ten or twelve cows, and as I wish to have none but profitable ones, I should be glad of the aid to be derived from the information of those who are more experienced, as to the breeds from which the most productive stock might be selected, taking into view both the quantity and the quality of their milk. It is presumed the imported breeds of cattle have been long enough with us to test their value for the dairy, compared with the best cows selected from our native stock. If gentlemen, who have tried them long enough to decide upon their comparative merits, would communicate the result of their experience through the New England Farmer, it would doubtless much benefit the public generally, no less then your humble servant, A Rustic.

Feb. 24, 1831.

FOR THE NEW FAGLAND PARMED.

D'SEASE IN SHEEP.

MR FESSENDEN-As the raising of sheep and the gre wing of wool have become an object of so metch importance, everything that would seem to impede or promote the prosperity of this great source of national wealth ought to be spread before the public. I would therefore beg leave through your useful paper to state a few facts relating to a disease, which had lately occurred) among sheep in this town.

The disorder may and no doubt has been in progress some time, but its direful and deadly effects were not visible until since cold weather set in. It has appeared in different parts of the town and among those apparently in the summer and fall in the best health, but has been confined mostly to young or yearling sheep. I have carefully examined several volumes of the New England Farmer to see whether the disease was described or a remedy proposed. If we except the two fellowing instances. I have not found anything that seemed to be parallel to the one above alluded to. A writer in vol. vii, page 109, under the signature of a 'Wool-grower' describes a somewhat similar disease among sheep. After examining every other part, he says that the laid the lungs open and in the cellular substance of the lungs and in the bronchial [air] vessel there were a multitude of worms about as thick as a linen thread and from one inch to six in length exceeding sharp pointed at one end,' &c. For which he prescribed Scotch snuff on the food morning and evening, and tar and sulphur once a day, which appeared to improve their health immediately, A. L. H. in Vol. viii, page 207, describes the symptoms, progress and direful effects of a disease as it occurred among his sheep, being no doubt the same disorder, which has made such havoe in this neighborhood. This writer not having made any examination after death, seemed to be altogether in the dark as to its cause or cure. Neither do those who answered his communication throw much light on the subject. But let us return to the malady which has prevailed among us and blighted the hopes of many a farmer.

The most common symptoms of the disease are a loss of appetite, general emaciation or leanness with a peculiar gauntness, so that the animal is bent up almost double and is hardly able to drag its tottering frame after it, and unless the disease is arrested by a timely remedy, often a scouring sets in and the pitiable creature soon falls a victim to the fell destroyer. One gentleman having lost many promising yearling sheep in this way, determined if possible to ascertain the cause. He commenced by a careful dissection of the head, expecting to find a worm or w rms, as much had been said or written to that effect. In this however he was disappointed; nothing daunted he proceeded carefully to follow down the whole alimentary canal examining every part; no sooner had he opened the stomach but he found innumerable minute worms from an inch to two inches in length, in size from a fine to a coarse linen thread, in color white or nearly so with one end sharp, and when examined soon after the death of the animal, they were very lively. Other dissections earefully made by many other individuals have

remedy was resorted to, which has not failed, I expectation the Trustees have not been disappointbelieve, in a single instance of effecting a cure, ed. At the same time they may be remitted to when timely administered. Half an ounce of say, that much more, they hope and trust, might Gum Aloes pulverized and mixed with a little have been exhibited had the inclinations of our meal and water, enough to make the whole into farmers corresponded with their ability. The thick dough, is a full dose for one sheep, and may Trustees are aware, indeed, that some extraordibe conveniently given by opening the animal's nary exertion and skill are necessary, in aid of a mouth and putting it on the root of the tongue good year, to meet the requirements of the Society; with the handle of a common iron spoon, or it but our enterprising bushardness, and all other may be made into small balls, and in like manner classes of citizens, would do well to have in mind given .- This quantity proves an effectual purge, always, that nothing of great worth is to be had and brings away large quantities of worms, where- without industry, and care, and skill. Labor is upon even many sleep apparently on the verge of the price demanded of us, by a wise Providence, death have been restored in a few days to wonted for everything truly valuable. It will be well, too.

From many faithful trials of the aloes in smaller doses, given to sheep slightly diseased, having noor amerites. & c. the most decided good effects have followed. One gentleman briving nearly 100 fine lambs in the fall, after losing about half of them, I advised him to try aloes as above directed. He first procured 1 lb, had it pulverized and ordered it given to Souly, but through mistake it was given to a about 20 : a decided good effect followed the administration of the medicine. He has since procured, and made use of a pound or more, by the use of which he says he has saved his flock.—The above facts are submitted, wishing that a fair trial may be made of the aloes should the same disease occur, or any other, where a purge is indicated, as it can be more easily given than any other of that class of medicines. The price of this article is cheap, it may be procured of any apothecary. I leave to others, more acquainted with entomology, to give a name to the worms above described, and to inform the public whether they are natural to the sheep in a state of health, and only when in too great numbers or under some peculiar circumstances they are the cause of death, and likewise to explain the reason why young sheep, in particular during the winter, fall the victims of this disease. L. W. BRIGGS.

Bristol, R. I. Feb. 21, 1831.

REPORT OF THE COMMITTEE ON GRAIN. VEGETABLE CROPS, &c.

The Committee appointed by the Trustees to examine the claims for premiums for Grain and Vegetable Crops, for Experiments and Discoveries, -for Raising Trees and Hedges,-submit the following Report-

The past season has been a most bountiful one, and has been particularly favorable for the production of almost every article which claims the attention and rewards the labors of agriculturists in this part of the United States. It is not too much to say, perhaps, that there has not been a week in which the want of rain has been severely felt in this commonwealth,-while the sanshine and heat have proved sufficient for bringing to maturity the crops and fruits of our farms, and orchards and gardens. Of grass, wheat, rve, barley, Indian corn,-of potatoes and vegetable of almost every description, the crops have been truly abundant. For fruit of every kind, excepting, perhaps, pears and grapes, for which latter the summer has been too cool and moist,-few seasons have been so good. Blessed with a year of so much confirmed the presence of like worms not only in plenty, it was natural to suppose that the claims of the stomachs but in the small and large intestines our farming brethren for the premiums offered by of sheep dying of this disease. As soon as the this Society, aided by the bounty of the Legisla-

cause of death was ascertained the following simple ture, would be numerous and respectable. In this to have constantly before as the force of example. The natural effect of a successful effort, in any pursuit, is to stimulate others in the same course, and thus to promote the general good. Care and system, like everything else, become easy by prac-

> It is a remarkable fact, that among the applications before this committee, there is not any instance in which two applications have been made for the same article. They are not embarrassed. therefore, as some of the committees have been, in comparing the merits of numerous competitors. They regret that one claim, at least, should not have been made for each article proposed by the

> The committee recommend,-instead of abstracts by the committee of the modes of culture. as has been usual,-that the statement of the claimants, in their own words, should follow each case. They are led to propose this, not only because they are generally very well expressed, but because they will be more intelligible to practical cultivators, probably, than any views the committee can give.

WHEAT.

I. The Committee consider Messrs Tristram Little and Henry Little, of Newbury, in Essex County, as cutitled to the premium of \$20 for a erop of spring wheat, being 343 bushels on an acre. These gentlemen have been benefited almost every year by the premiums of this Society, and seem righly to deserve all they have received. as judicious cultivators.

To the Trustees of the Massachusetts Agricultural Society.

GENTLEMEN-We sowed the present season a piece of spring wheat, containing, by admeasurement, one acre and one rod. The soil is a rich dark loam, the past year it was cultivated with onions, and manured with yard (or cellar) manure, about eight cords to the acre, which produced between four and five hundred bushels. The 22d or 23d of last April it was sowed with wheat without any dressing; one bushel and a half was sown (the wheat was of the white kind) the soil was once ploughed and the grain barrowed in. It was reaped in August, which cost four days' labor: the quantity of straw was as large as the bulk of five tons of hay. It was threshed and winnowed in October, which cost ten days' labor, and there were thirty four bushels and one peck of grain.

Respectfully yours,

TRISTRAM LITTLE. HENRY LITTLE.

Newbury, Nov. 2, 1830.

2. To Capt, Benjamin B. Howard, of West Bridgewater, Plymouth Co. is awarded the premiushels the acre.

o the Trustees of the Massichusetts Voricultural Society.

something near 400 bushels. In April last, it cart loads of coarse manure from the barn ndows, were drawn on, spread, and harrowed

at the rate of about three bushels to the acre, d with grass seed, which also were ploughed d harrowed in. The crop was mown and got in July, and was threshed out in September th two horses, in less than two days. It was aned with a machine, and measured 78 bushels I one peck of clean handsome barley,

BENJ, B. HOWARD,

RVE

3. To Mr Richard Adams, Jr, of Newbury, \$20 the premium on winter rye-being 389 bushou an acre-

be Trustees of the Massachusetts Agricultural Society. Gentlemen-Agreeably to the directions of

Trustees of the Massachusetts Agricultural ciety, requiring each claimant to state the qualiof the land, its previous product, &c, I submit fellowing, in support of my claims for the Soy's premium for raising the greatest quantity of on an acre the present year. The soil is a velloam; the season of 1829 it was cultivated h white beans without any manure, which proed about 25 bushels. The September follow-(after the crop was harvested) the ground was ughed and five pecks of rve was sowed and rowed in. The April following, there was ead on the same about ninety bushels of leachishes. It was reaped and threshed in July, the produce was 38 bushels and three pecks. s straw I sold, which weighed more than two 5. The labor done on the above crop was, as will see, nothing extra except the dressing h ashes.

Yours respectfully,

RICHARD ADAMS, JR. Vewbury, Nov. 1, 1830.

1. To Mr Payson Williams, of Fitchburg, an customer from the County of Worcester, \$20 his crop of potatoes-about 570 bushels to an

te Committee on Agricultural Products.

m of \$30 for his crop of barley, being about 48 turnips for the successful culture of which, the gard, and one great object of the Society is to clisheep (100) were nightly folded, for two pre- cit the opinions of observing farmers for the pubvious years, after the hay crop was taken off. hie good. \$69 S3 In reading Mr Williams' account of his fine crop of potatoes, our farmers are requested to notice that the manure was spread over the ground instead of being put in the hill in the common way. If using manure at broad cast will give as good a crop of potatoes or corn as putting it in the hill, will it not be a great saving of labor, and at the same time, place the manure more equally on the ground? No process in farming seems more slow and tedious than dunging out in the hill. It is hoped that this statement of Mr Williams, who has always appeared before this society as a very intelligent and successful farmer, will bring out some remarks from practical men on this subject. It will be seen that Mr Ware, of Salem, planted this year, in the same way, both corn and potatoes, Among our New England crops, none are so general, or more important, than corn and potatoes, and if a more economical mode of raising them. as regards labor, can be found out, it will be a TENTLEMEN-As a claimant for the premium great public benefit. Mr Williams used a great quanred by the trustees of the Massachusetts Ag- lity of manure, it is true, perhaps twice or three ltural Society for the largest crop of Potatoes times as much as is usual among farmers, and his wn on the acre the present season, I will state, land was in good condition before; but then he the ground on which my crop was grown, in- intimates, and seemingly with reason, that, owing es to the morning sun, is of a deep reddish to its being spread and ploughed in, not more than a, somewhat rocky. In 1829, an abundant half its strength was drawn out by the potato of winter rye was taken from it, preceded by erop. All experiments of this kind deserve re-

BOSTON, WEDNESDAY EVENING, MARCH 2, 1831.

FARMER'S WORK FOR MARCH.

Cattle should be liberally supplied with food from this time till they can be turned to grass. As straw and hay become drier than they were in the fore part of the winter the supply should be greater, and the quantity of roots which you give them had better be increased than diminished, Potatoes are better food for breeding ewes than turnips, which it is said are apt to injure the

Dress with stable, compost, hog-pen or such other well rotted manure as you have, such grass ground as you have neglected in autumn; three loads now may be equal to two then; but it is best to secure a good crop even now. Your winter grain should now be dressed with plaster, if it was neglected at seed time; your moving grounds which are upon a dry soil, will pay you well for a bushel or two of plaster, or a few bushels of lime or leached ashes to the acre.

Your orchards continue to claim your attention -give to each tree a top dressing of your best chip, stable, or compost manure : your fruit will richly repay, besides the extra profits upon your grass under your trees, whether moving or pasture, together with the growth of your trees.

Look to your water courses, and change their direction to receive the benefit of the spring rains; the frequent changing of your water courses will render your mowing even, and prevent one part from becoming rank, and lodging before the other part is fit to cut, and thus turn to your best profit, that which if neglected would become waste and

Do not permit the carcases of dead animals, such as lambs, cats, &c, to contaminate your premises, and poison its inhabitants. When domesticated animals die, it is the common practice to let them rot above the ground. This is sure to annoy the neighborhood. If the steach from the animal be too distant to contaminate the air, dogs are fond of carrion, and after they have gorged themselves with it, become insufferable inmates to the families to which they belong. The dead animal should be laid on a thick layer of earth, and well covered with the same material, After the covering has sunk in, and the earth has absorbed the animal matter, the compost will not be more offensive than slaughter-house dung, provided a sufficiency of earth has been employed. They should be hauled to the field during winter and ploughed under as soon as frost will permit. The same should also be done when night soil is

Sir Humphry Davy, observed that 'Manures from animal substances in general require no preparation to fit them for the soil. The great object of the farmer is to blend them with earthy constituents in a proper state of division, and to prevent their too rapid decomposition,

The entire parts of the muscles of land animals

are not commonly used as a manure, though there and I have been led to believe that no time is of other nations, the raw material of which ma are many cases in which such an application more favorable. might be easily made. Horses, dogs, sheep, deer and other quadrupeds that have died accidentally or of disease, after their skins are separated, are often suffered to remain exposed to the air or immersed in water till they are destroyed by birds or beasts of prey, or entirely decomposed; and in this case, most of their organized matter is lost from the weather, would not be a good substitute ed some valuable improvements, especially in the for the land on which they lie, and a considerable portion of it employed in giving off noxious gases to the atmosphere.

By covering dead animals with five or six times their bulk of soil, mixed with one part of lime, and suffering them to remain for a few months, their decomposition would impregnate the soil with soluble matter, so as to render it an excellent manure; and by mixing a little fresh In some trees, (as in the Fall Pippin) the limbs children may be honorably and profitably engager quick lime with it at the time of its removal, the disagreeable effluvia would be in a great measure destroyed; and it might be applied in the same way as any other manure to crops.

Procure the very best of garden seeds and other seeds for the ensuing season. If you mean to deserve the character, and realize the profits of a good cultivator, you will see that every article of use in your honorable vocation is among the best of its kind. You must plant good seeds, or you will not grow good vegetables, possess good breeds of domestic animals, or your stock will not be so valuable as it might and ought to be. If your tools and implements are not the best, you will waste much strength to little purpose when you attempt to use them,

Those plants, which you wish might yield a forward crop, such as garden peas, beans, &c, may be sown very early in the spring, and very thick in hot houses, or under hot bed frames, or the south side of walls, and transplanted when they are one or two inches high, into the places in which they are intended to stand for a crop,

Your ploughs, harrows, carts, hoes, rakes, &c, should be inspected and put in readiness for use. They will last the longer if painted or covered of adopting measures to promote the growing of with some suitable composition. Covering wood the Mulberry Tree, and the Culture of Silk, have repeatedly with oil or grease will have a tendency had that subject under consideration and ask leave to preserve it. Where tools or implements are to submit the following exposed in the field a good part of the year, they require to be new +ainted at least every second year. This applies as well to the iron as to the wood, both of which should be kept coated, as far as is practicable, with paint or oil.

It will soon be (if it is not now) the proper season for pruning fruit trees. London says ' For all the operations of pruning which are performed on and manufacture silk in this Commonwealth to an the branches or shoots of trees, it would appear the period immediately before, or commensurate with the rising of the sup is the best.' Col. Pickering observed, 'My practice has been to prune in in the culture and manufacture of silk. France, the spring, beginning when the buds have searcely begun to swell, and ending before the expansion of the leaves. But I never leave 'stumps' of limbs. Every branch that is taken away, is cut close and even with the stem or limb where it grows; and the healing of the wound commences and proceeds kindly as vegetation advances. If amount of silk imported and consumed in this the branch cut off be large, the wound should be country, which exceeds seven millions of dollars, covered with some kind of plager.'

last observes, it has been my practice for several like these need no comment; yet it is proper that years past to prune in autumn and in winter, ap- we should bear in mind, that the vast sums thus explying a cout of boiled tar and brick dust, or of pended for silk, in its various forms, are paid indi-common paint, immediately to the naked wood: rectly to enrich the Agriculture and Manufactures

Jon rious to fruit trees; for I could not perceive why than II. Cobb, Esq. of Dedham, has commence an artificial covering, which protected the wood the culture of silk with success, and has introdu for living bark. I began the work, therefore, as art of recling from the cocoon, and it is due to the soon as the leaves were fallen; and I never saw gentleman, that the committee should remark, th trees bear pruning better. . 1 considerable part of it is from practical information communicated 1 my fruit garden was pruned two months ago.

Permit me to add that it is a maxim in surgery in relation to this subject. to save skin, and in pruning to save bark. The The state of society in this Commonwealth saw ought therefore to be used in preference to well adapted to promote the successful culture the axe, so as to cut the large branches square off. silk-it is an employment, in which females a are much less two or three inches from the trunk; with the exception of planting the Mulberry tre and if taken off at that distance, would be much the whole labor may be performed by that class sconer covered up with new wood. It is injudi- the community. The committee feel warranted cions, however, to leave the sumps too long, as | saying that so soon as the article can be produce well as to cut too close to the trunk.'

LEGISLATIVE ENCOURAGEMENT TO THE CULTURE OF SILK.

The following Report of a Committee of the Massachusetts Legislature is ably drawn, and the paramount importance of its objects concisely and happily expressed. At the time this was sent to the press, the Report had not been brought officially before the House, but so far as we can learn, public opinion is much in favor of some legislative aid in the object contemplated in the hill; and we hope that our rulers will readily take proper measures for supplying the people with 'that capital which consists in knowledge;' which seems all that is necessary, in addition to the enterprise and industry characteristic of our countrymen, to make Silk a staple commodity of New England.

House of Representatives, Feb. 24, 1831. The Committee on Agriculture to whom was referred the order to manire into the expediency

The Committee have examined the subject attentively and find it to be of much greater importance than was at first supposed. They are surprised to find how great a field is here open, and how long it has been neglected; they are satisfied beyond a doubt, that we have the power to produce immense extent, and that no difficulty is to be encountered either from soil or climate.

The nations of Europe are generally engaged more than any other nation, derives her power and resources mainly from this branch of her industry; her example has induced England, Holland, Germany, Prussia, and Sweden to engage with zeal in the same pursuits.

The culture of silk is important in relation to the while the amount of bread stuff exported is on the A writer for the Genesee Furmer of January average less than six millions of dollars! Facts

BRIGHTON MARKET-Monday, Feb. 28.

[Reported for the Chronicle and Patriot.]

At market this day, 382 Beel Cattle, 14 Cows and Calves, 902 Sheep, and 78 Swine. 91 Sheep and all the Swine have been before reported; unsold about 40 Beef Cattle and 75 Swine.

Prices-There was a larger proportion than usual of good Cattle at market, and we are of opinion a little better price was obtained. We shall quote higher-from \$4 to \$5; a few extra were taken at 5 25 and 5 50.

Cows and Calves-We noticed sales as follows: \$16, 19, 21, 22, and 24.

Sheep-We noticed one entire lot of 96 taken at \$5 50 each; one small lot at \$5 00; also 8 Cosset Wethers at \$8 75 cach. We also noticed a lot of 193 Merinos, the pelts of which were sold at 2 25 each.

Swine-Not much doing except a little at retail at 5c. for sows and 6 for barrows,

New York Cattle Morket, Feb 21 .- At market this day, from 1 to 500 head of Beef Cattle, and about 800 Sheep .- The market for Beef continues good, and price high. Several lots of favorite Cattle taken at \$7,50 a 8; Novers, Hemp Seed, Flax Seed, Broom Corn, Sc; and 1 mgs. Section loss of avortic cattle taken at \$6,00 a \$5 of the very first quality.

Wented,

Wolumes 2, 3, and 6, of the New England Farmer, to and mid \$2,50 a 3 each. Milch Cows—Several sales a

MISCELLANY.

ICELAND.

Concluded from page 245.

'At first, I confess, I shuddered at the idea of spending a winter in Iceland; but what was my surprise when I found the temperature of the atmoswinter in Denmark, but equal to that of the mildest I have lived in either in Denmark or Sweden!

'In the month of November, the mercury in Fahrenheit's thermometer did not sink lower than 20°, and it was nearly as often above the freezing point as below it. On the 6th of December, with clear weather and a light breeze from the cast-north-east, it sunk to 8° 30", after which, especially towards the end of the year, the weather became remarkably mild, and continued in this state till near the middle of January; the thermometer for the most part between 34° and 40°. On the 10th and 11th of Jannary it fell as low as 15° 30″, but rose again in a short time, and continued much more frequently above than below the point of congelation till the 7th of March, when we had a strong wind from the N. N. W., and the mercury, which had stood the preceding day between 30° and 34°, sunk in the morning to 9° 30", at noon to 8°, and at 9 o'clock in the evening it fell as low as 4° 30', which was the strongest. degree of frost we had the whole winter.

The quantity of snow that fell during the winter was very considerable, especially in the northern parts of the island, where many of the peasants were reduced to circumstances of great distress, by the total consumption of the folder they had provided for their cattle. The atmosphere was on the whole rather clear and serene, than darkened by mists, which is in a great measure to be ascribed to the prevalence of brisk land winds, to which the mountainous nature of the country is extremely favor-

'It must, at the same time, be allowed, that the winter of 1814, as well as that which immediately preceded it, was considered by the Icelanders as uncommonly mild. The keenest frost ever experienced in Iceland was in the year 1348, when the ocean was congealed all round the island, so as to admit of the inhabitants riding on horseback from the one promontory to the other on the ice.

Nothing so materially affects the climate of Iceland as the arrival of the floating ice from the opposite coast of Greenland. Generally towards the end of winter, and sometimes in the beginning of summer, it is seen moving towards the coast in immense masses, which are not unfrequently piled one above another, and more resemble islands with mountains, castles, and spires, than bodies of ice. They are so thick that they have been known to run aground in eighty fathoms' water. Their motion is not so much accelerated by the wind as by the current; but their rapidity, when unpelled by these two causes conjointly, is so great, that no six-oared boat is able to keep up with them. When the sea is agitated by a storm, the ice-islands are dashed against each other in the most tremendous manner; the noise arising from the crash is heard at a great distance; and, as often happens, the drift timber jammed in between the masses takes fire from the friction, presenting to the eye of the spectator a scene the most incongruous that can possibly be imagined. The quantity of floating ice is commonly so great, that it not only chokes up all the friths and bays, but extends to such a distance in the ocean that its termination cannot be discovered from the summit of the highest mountain; and in the year 1766 the whole of the va.st strait between Iceland and Greenland was entirely closed up with it. It principally infests the northern, and part of the castern coasts, as likewise the western friths, but it is seldom that it surrounds the whole island.

While the masses of ice remain in a state of fluctuation, sometimes at a distance, and sometimes nearer the coast, the weather is very unsettled, and the winds are cold and damp; but when they are

driven into the bays, and the salt water freezes around them, the weather becomes more steady; the cold increases; and insalubrious fogs are carried over the whole island. The consequences are, that the winter snows are longer in melting; it is late before the frost leaves the ground; vegetation is more backward and scanty; and the summer so short, that the peasants have great difficulty in getting Datch Cabbage; Early York, do ; and several other v phere not only greater than that of the preceding home the small quantity of hay that may have been produced. Add to this, the devastations committed growth. London Scarlet Short Top Radish; and Cher by the Greenland bears, which sometimes arrive in and White Turnip Radish. heights and hollows of this remarkably uneven island, one dark night, was at length puzzled by a plaints, and particularly the Sore Throat, will be for height, which his sagacious horse refused to mount, in the New England Farmer, vol. v. page 567, written However, the whip compelled him to it; and the gentleman did not discover his situation, till the fore-feet of the animal stuck in a hole, which he he found, on dismounting, was the chimney of a house !- Henderson's Iceland.

A composition for coloring and preserving Gates Poles, Barns, Roofs and Timber generally, from the weather. - Melt 12 ozs. rosin in an iron pot or kettle. add 3 gallons of train oil and three or four rolls of brimstone; when they are melted and become thin, add as much Spanish brown, or red or vellow othre. or any other color you like, ground as fine as usual with oil, as will give the whole the shade wanted .--Then lay it on with a brush as hot and thin as you can. Some days after the first coat is dried, lay on a second.

years, and prevent the weather from driving through by Thomas M. Smith, Veterinary Surgeon, and Men brick walls.—Domestic Encyclopedia.

Light Varnish to preserve Insects.—Take a pint of spirits of wine, and a little light amber, which should be allowed to dissolve in a sauce pan for fortyeight hours; to this add a little mastic, as much red arsenic, and an equal quantity of turpentine and let it dissolve in a vessel for twentyfour hours. This done, take the insect you wish to preserve, extract its entrails, and let it be well bathed for several days in spirits of wine, into which some sugar candy has been put. In this state, rub it over with the varnish at intervals until it shines; it may be thus preserved for a long time.

Anorel undertaking .- The London Court Journal. states that 'a large establishment has been projec ed at Paris, for the purpose of enabling any individuals by the annual payment each of 700 francs (less than 301.) to enjoy all the pleasures of social, with all the independence of domestic life. For that sum they are to have lodging, board, clothes and washmg, the use of a library, the daily papers, billiard rooms, play, conversation, &c. The whole to be under the management of a Committee chosen by themselves. The prospectus even holds out the expectation of a country house, and free admission to the theatres!'

POLITICS FOR FARMERS. Concluded from page 257.

them: but we must hasten to conclude.

Revenue, in some way raised, must be had .etness of this opinion or practice. It is suffiarket to our farmers, has not affected the d in a manner that cannot be disputed, that the the greatest rate. There is no wonder in thisis the natural result of competition-no matter ether among ourselves, or of the working peo-

of the United States against those of Great Brit-. Take the strong case of fire-brick, not affectby any newly discovered machinery, but only the application of American labor, to bring o value what had been valueless American tis. While England had the monopoly, the ce of each brick was seren cents; but when persevering Messrs Berry, of Baltimore, under encouragement of the 'Maryland Institute,' of-'s, the English makers were content to receive by the 'tax' upon them, same for theirs. Generous men! but such is inevitable effect of a brisk and well-managed petition in all things. Monopolies cannot long st among ourselves. The Messrs Berry alby have successful rivals in their meritorious mufacture in Baltimore. This is unavoidable n ssily, or what the ancients called 'Fate,' and is pplicable to every domestic manufacture, unless

is insignificant to excite attention. Ve shall show in a note below, that protecting Is never had but little, if any effect on the mue as derived from the customs (unless to inuse its amount,) though the ruin of that revenue mournfully predicted. Those who made such lictions knew not even themselves-much less e they acquainted with the laws which regulate ety. Desire always presses upon means. The who earns one dollar a day generally saves as h money at the end of a year, as another who s a dollar and a half-for the reason that the r indulges himself in what he calls comforts, the range of ' holy truth.' e the other is bound down to the purchase of nessaries, only. These things are within every we's experience. We ask our readers to look and among their neighbors, and see if these not so. And, strange as it may appear, a manuairing village of 500 persons, though the ter part are children, consume more dutying articles than an agricultural population In 1816 and 1817, because of the exothe same class) of 2,000 persons. The regureceipt of money by the former, enables, or tents, them to gratify themselves in comforts.'

with it. There are more silk gowns and yards of 1819 ril-bon, at a factory using 500 bales of cotton a 1820 year, than among the persons engaged in growing 1821 General remarks.—An important commentary \$10,000; and much more tea, coffee and sugar is \$1822 the facts stated, naturally presents its ff-for used, Curus, after his overthrow of the Babylonish 1823 atters of most serious interest to a large major- empire, was told how great a sum of money he 1824 of the people of the United States are involved might have possessed, had he retained justical of 1825 distributed, the fruits of his victories among his 1826 friends and followers. We add a table of the receipts, according to the nett amounts given by Seybert antil 1815, and since derived from the documents,

The average from 1791 to 1800 was

less than 1800 to 1812 (or the war) 12,000,000

hausted stock of foreign goods of all sorts during the war, the average was

の近まなほのなり このの可の異なる Such is human nature, and we shall not find fault 1818

duct, great for export, is of small comparative This may appear an extravagant expression to from holy writ,' that this assertion is much within

(a) Notwithstanding the protecting tariff of 1816!

(h) Increase of two millions, not vithstanding the tariff of 1824.

(c) As stated by Mr Secretary Ingham notwithstanding the revenue destroying tariff of 1823. In 1819, the three first quarters yielded 17,770,000.

Manufactures in Egypt .- A late Bombay Courier published the following:—An Arab ship arrived from the Red Sea, has brought 250 bales of Cotton Yarn, the manufacture of Ali Pacha, at his spinning mills near Cairo. It is reported that he has sent 500 bales \$8,000,000 to Surat, 1000 to Calcutta, and that he intends next season to send long cloths, Madapollans, &c, having established steam power looms!

These goods are at present admitted at 60 per cent invoice cost, besides 4 1-2 per customs.

What will the mercantile community say to this (a) 31,500,000 new competition?—Balt. Gazette.

17.000,000 20,000,000 15,000,000 13,000,000 17,000,000 19,000,000 17,800,000 (b)20.000,00023,000,000 19,700,000 23.000,000 (c)22.500.000(c)22,000,000

These figures simply show that the various tariffs have had no necessary effect on the revenue unless probably to increase it. In 1820, '21 and '22, the productive labor of our country was at its lowest ebb, and the revenue, in three years was only 45,500,000 -or the same sum as is the two

The great benefit to the farmers from the division of labor, has been conclusively demonstrated-but what must become of at least two mestic manufactures and internal improvements, these being abandoned? This is, indeed, a SOLEMN QUES-TION. Are the tanners, curriers, boot and shoemakers, cabinet-makers, chair-makers, coach-makers, saddlers, and all the rest of the mechanics, to be east out of "To yment-all the workers in duce the tax that he paid. We do not grow any iron, lead, copper, -in wool and cotton, flax and ten. But there is a 'tax' of 15 per cent, or, 15 henry, to be driven from their homes, to seek new dollars on every hundred of the cost,' as Mr Raguet means of livelihood, and simply because these has it, on wheat and Indian corn-acorns and freemen increase and multiply faster than some of ad a quite equal if not superior article, at three hickory nuts but the price of these is not affected the southern holders of slaves wish that they should do? Here is the foundation of the opposition It is then manifest, that the farmers pay less to the protecting tariff. It is not worth while to money for the articles needed by them, because mince the matter. As we stand before God, we beof the manufacture at home, than they did be- lieve that the more rapid increase of citizens in the fore such manufacture was established. We defy north, middle and west, is the leading cause of the the showing of a single case to the contrary, even furious opposition to the tariff that is now going on, on ' cradies' or 'artificial flowers.' But this is though unknown to the multitude of our opponents, not all. The divided labor of the people gives for the accursed thing may not be openly prothe land-holders larger and more safe markets for claimed. We believe it is the ground on which their various commodities in grain and other veg- the leading politicians of South Carolina have placetables, meats, drinks, fuel, timber, lumber, and ed themselves. COMMUNICATIONS.

PLANTING ON GREENSWARDS.

Mr Fessenden-In answer to the inquiries of your correspondent, who styles himself 'A Young FARMER,' relative to my method of making the drills and planting corn upon greensward, I will briefly state, that my corn was not planted in hills but in rows. After turning over the greensward, preparatory to planting, I did not furrow the ground with a plough. The drills were made by a hand instrument very similar to that which is commonly used in making drills for sowing garden seeds, making three rows at a time. The instrument resembles a rake, having three teeth set other to give a proper width between the rows, and having a joint near the middle, so that either end of the head may rise or fall to accommodate itself to any unevenness of surface. As nothing more is required than merely to mark out the rows to guide in dropping the seed, the instrument may be so light as to allow of its being easily drawn by a man or boy. If the inverted sward be well harrowed, and compost manure be spread on and mixed with the soil, abundant materials will be found for covering the corn.

Not being a farmer of very long experience, I be planted with corn. My own practice has been to spread it on the surface before ploughing and turn it under the sward. In this way the whole strength of the manure is preserved, and if any one should apprehend, that, by thus turning it the manure, let him open the ground between the rows of corn about the time when the ears are filling out, a period at which the crop most requires nourishment, and he will readily discoverhat the roots, aided by the finely pulverized condition of the decomposing sod, have found their way to the treasure beneath. This is no doubt the best manner of applying manner, where the depth of the ploughing does not exceed three or four inches. But if the ploughing be deeper, and a natural heat was raised in the hive, the bees were considerable portion of the poorer subsoil be turned up, it would be preferable to make a compost, exhalations were condensed into water, part of formed of one part of stable manure, mixed with the honey was rendered uncommonly fluid, and two parts of swamp mud or loam, and after allowing the whole mass to ferment very moderately, the water in the hive was soon frozen. The fetid excellence. It would appear probable that the to spread it on the inverted sward. Let the compost thus spread on be well mixed with the soil by the use of a light harrow drawn lengthwise the furrows and then rolled, and there will be very little if any waste of the nourishing matter by exposure to sun and winds,

ten to fifteen cart loads of stable manure and from one day, yet the steam arising from it was like twenty to thirty loads of compost to the acre. that from a hoiling pot. FOR THE NEW ENGLAND FARMER.

BEES.

MR FESSENDEN-In your last paper Mr Beard relates a singular incident which had befallen a hive of his bees in January last. It so happened that the very day before I received the Farmer, I was favored with a letter from a gentleman in Sturbridge containing an account of a similar mortality, the present winter, he has lost all his young swarms, amounting to seven in number, all of which were plentifully supplied with honey. In December last he placed his hives on a bench in bee house made so perfectly tight that a bee could not escape. He intended to have cut apertures in front of the house corresponding with the entrance of the hives and placed them in contact, but this was unfortunately neglected. When the hives were moved into the house, the entrances of the hives were closed with a piece of shingle not so tight as to exclude the air entirely; these were sufshall hardly venture to give directions to your cor-fered to remain two days after the hives were respondent, as to the best method of applying housed and then taken away, and in about ten fresh horse stable dung to greensward that is to days, he found two swarms dead, and since then all have died except one old hive that stands upon an empty new hive. Before he discovered that any of the bees were dead, he noticed a considerable quantity of thin watery honey upon the bottom board which dripped down from the comb. under, the crop will not get the whole benefit of He then examined more closely and found the bees were dead and the hive emited a fetid smell. There was a considerable quantity of frost and ice within the hives, which seemed to be formed from water that ran down the inside of the hives, at one time it nearly stopped the entrance to the

(My answer.)

'Your bees undonbedly died from suffication. Being entirely excluded from external air, a preterforced into a profuse perspiration, the perspirable after the bees were dead, no heat remained and tise, but no satisfactory information concerning their smell in the hive was occasioned by impure air.'

they are capable of generating heat sufficient to and disseminate information upon the subject, support them during the cold of winter; but they would not have omitted efforts to obtain a variety

For a corn crop I usually spread on from to the open air, and its entrance stopped up but the astonishing number of eighty native varieties Mr Beard inquires, how bees have the power be of the same kind with that mentioned by Maof creating heat, so as to melt their comb at any jor Long. It is thus described. 'It ripens in the time when they please,' at the same time says 'he has conjectured the cause.' It is hoped that he will make the public acquainted with his conject. It has a stender bluish purple Vine, that runs of MR FESSENGEN-Will you or some of your ure, and also whether he has had hives stopped the ground among the grass.' It would certainly

best hay for cattle on a rich moist loam? Also without unquestionable authority I could not receive as even credible. It is, that bees will surof the earth for five or six months as practised in New Hampshire. See New England Farmer, vol. 5, page 82, 190, 402, and my Treatise on bees, page 119, 120. But I have been informed by Mr Beard that he tried the experiment with three hives and they all came out dead in the spring, and one person in this vicinity lost a hive in the same man-

I am with respect your obedient servant. JAMES THACHER.

MAJ. LONG'S GRAPE.

MR FESSENDEN-In the Journal of the Expediin the head, at a sufficient distance from each but to a greater extent. Since the setting in of tion of Major Long, to the Rocky Mountains, mention is made of a kind of Grape, growing wild in the country through which the Expedition passed, whose excellence is spoken of in terms of the highest admiration. The following is a part of the account of this Grape, extracted from the Journal of the Expedition. 'Many of these,' referring to the Vines, were so loaded with fruit as to present nothing to the eye but a series of clusters so closely arranged, as to conceal every part of the stem. The fruit of these vines is incomparably finer than that of any other native or exotic which we have met with in the United States, I wish, Sir, to make inquiry through the medium of your paper, whether the Vine here spoken of has been cultivated by any one, and its merits actually tested. If the account of it above given be correct, adapted as it is to our climate, this vine will most likely make a valuable addition to our stock of table, and perhaps of wine grapes. In an article in the 57th number of the Londor Quarterly Review on the Valley of the Mississippi. the review asserts it to be the Vilis vinifera of Wine Grape of Europe, but I find nothing in the Journal of the Expedition which would warrant such a conclusion. Thave hastily examined Prince's Treatise on the Vine, a work which I doubt not contains a great fund of useful information as well as gratifying to every lover of the Vine and exhibiting great research, but I find no satisfactory account of the one in question. I think it probable it must be indentical with one of two varieties inserted in the Catalogue of Prince's Garden viz. Long's Missouri and Long's Arkansaw, and of both of which I think a short sketch is given in the Trea-Messrs Prince with their ardent admiration of Bees cannot survive long without fresh air, the Vine, and their persevering efforts to obtain cannot sustain a great degree of preternatural heat, or species so highly recommended, and by so re-It appears that Mr Beard's hive was exposed speciable authority, and that it must be included in described in the Treatise. In Flint's History and month of June, is cone shaped, transparent, with four seeds, reddish purple, is a time fruit for eating. appear, from all the authorities that there does ex-In this connexion I am reminded of a fact list in the Western Country a species or variety 0 or grasses are the most productive and yield the which always strikes me as inserntable, and which the Vine, which if not superior to any of the culothers besides your correspondent. Berlin, Ct. Feb. 22, 1831.

MILCH COWS.

Mr Fessender A Rustic' is informed that Long Horns give better milk, but not so much in quantity as the Short Horns. The best of the Short Horns with the richest keep that Old England can afford, are said to give 36 quarts wine measure per day,

The celebrated cow Belina, imported by Col. Powel, is said when in England with her first calf to have given upwards of 4 gallons of milk wine neasure at a meal, or 8 gallons per day, but since ner arrival in Pennsylvania, there is no account of her exceeding 26 quarts per day. John P. Milnor, Esq. Recording Secretary of Penn. Agric. Society, ertifies 'this cow has had no other food than slop of Indian meal, clover and orchard grass, has yielded epeatedly by measurement 26 quarts within the 14 hours.' She was undoubtedly the best cow hat was imported by Col. Powel.

The size of the improved Durham Short Horns, he quantity and richness of the food they require, ender them objectionable for this part of the counry. Very few of us are able to keep our cows a clover and orchard grass up to their eyes, and upply them with as much Indian meal as they an cat.

The North Devons give rich milk, but in small uantity; the Herefords, and Sussexes give more quantity and rich in quality; they all produce ood working and beef oxen, more especially the vo former.

The Fifeshire cows are small and usually black; a ood Fife cow will give from 5 to 7 gallons of milk er day: from 7 to 9 pounds of butter and from 0 to 12 pounds of cheese per week, tron weight, 24 ounces to the pound,) for some months after alving. It is said that a Fife bullock of 40 stone ill bring an equal and often a higher price at the ondon market than an English bullock 10 stone eavier and equally fut.

The . Ilderneys are very small but give very rich ilk, and when well kept give a fair proportionate

uantity for their size.

It is said in the Chalais of Grayers in Switzerind, there are cows which yield each from 60 1 64 quarts of milk a day, but they are almost s large as Elephants, not very well calculated to Il themselves by grazing on our gravelly halls, and orn out plains, but better adapted for the intervals f the Connecticut, or the alluvious of the Missisppi.

The Galloway, a pole breed rather under size, revailing color black or dark brindle, give more ad richer milk than any other imported stock in oportion to their size and keep. Seven quarts of reir milk will produce cream sufficient to make pound of butter. These cattle are sometimes sent ere is perhaps no breed that sooner attains macrity. They fatten kindly on the best parts, the sh is of the finest quality. Of this breed there previously.

tivated, exotic or native varieties, possesses very is a variety termed Suffolk Dans, they are also polgreat excellence. Any information concerning it led but possess little of the beauty of the original like manner in the berry without taking the pulp would be adding to the stock of our knowledge stock, and are chiefly remarkable for the abunupon this important subject and probably gratify dance of milk given by the cows. A good cow in prime will give 8 gallons of milk a day, a great part of the season 6 gallons; best milkers red brindle, yellowish cream color or light dun: (See Coventry on live stock, p. 28, and Col. Pickering on improving the native breed of New England cattle, New England Farmer, vol. iv, p. 82.) A few years since Galloways might have been obtained of pure blood in Mass, either at Chelsen, Noddle's Island or Shirley, but it is feared they have been adulterated and deteriorated by crossing with the Short Horns.

It is recommended to 'A Rustic' that he should select the best cows through the state without regard to breed, size or color; perhaps he may find one or two in a county of the first quality, that will amply pay him for his journey, It is said that Reading has produced a cow that has exceeded 20 quarts of milk a day; also Somerset and Plymoith, and 50 years ago there was one in Plympton that gave 15 quarts a day of the yellowest and best of milk, 5 quarts of which were said to have produced cream enough for a pound of the yellowest butter. This kind of selection was the method pursued by the late enlightened agriculturist and distinguished philanthropist, the never to be forgotten Fisher Ames, and he then had the best set of cows and the best dairy in the commonwealth. COLONUS.

March 5, IS31.

LIVE FENCES.

[Extract of a letter from Caleh Kirk, Esq. a distinguished far-mer near Wilmington, Belaware, to Dr Benjamin Shortleff, Ros-ton, communicated for publication in the New England Farmer.]

RESPECTED FRIEND-I duly received thy favor of the 11th, which I feel bound to answer as early as my other engagements would admit. Though I am not any longer a farmer, I feel gratified if I can aid them in their laudable pursuits, and more especially in live fencing, which occupied my close attention upwards of twenty years practically; my neighborhood evinces the benefit of it.

I communicated my knowledge then on that head to the public, through the American Farmer published in Baltimore. Sir John Sinclair, of Edinburgh, Scotland, President of the Board of Agriculture in Great Britain, seeing that paper, wrote for some seed of the two kinds that I had there recommended as the best kinds for fencing. I shall give the direction now that I gave him, to manage the seed, which after many trials I found successful; he followed my direction and although the vessel that carried them over, did not leave Philadelphia until the tenth of March, 1820, he received them by way of Liverpool, and planted so as to obtain a growth of the Virginia kind eighteen inches high, that season, and says they will be a great acquisition to to that country; and then ordered on behalf of his gardener, ten nounds' sterling worth of seed, as that kind had never om their native pastures in Scotland directly to been introduced there before; the Newcastle kind mithfield, a distance of 400 miles and sold at had, by being planted in gardens as a curiosity; I nce to the butcher; and in spring they are often give their common names with which farmers are town in Norfolk immediately after their arrival, in most familiar. Those I sent of the Virginia had good condition as, or even better than, when been rubbed or triturated when gathered in the bey began their journey. With full feeding fall, and hung up in a bag in an airy place, where they would not be deprived of their vegetative powers, and I packed them up and placed on the t being well intermixed or marbled and their top of some quicks that I had placed in the box

The Newcastle or Cockspur kind I placed in off, as that kind will not vegetate the first season by any mode yet discovered, but must lay deposited in the earth, and under the influence of wet and frost two winters. The Virginia was treated similar many years as it was thought necessary. But many years past I obtained some cleaned seed that I gave two dollars a quart for, the beginning of March, on purpose to try if I could not vegetate them without a winter's frost, I put them into warm water two or three days, had them in a vessel standing on one of our open stoves whose heat never was too warm to bear the hand-then put them on a suitable vessel, spread them, and watered so as to get the action of frost as much as the latenes of the season would afford # a few days after I set them in my meat or smoke house to keep them secure from some pigeous that frequented the place; the smoke house was warm by smoking the meat, and in a few days, before I was aware, I was informed my seeds were vegetating. I hastened to put them in a bed, prepared and sowed them, raking them to cover, my object was obtained-to find a short time was sufficient to vegetate the seeds, and my direction to Mr Sinclair was simply to immerse them into warm water a few days previous to planting, to soften the hard shell inclosing the kernel, after keeping in a dry state through the winter. His success very fully proves that is all that was necessary.

I think there was something published at one time of my recommending hot or boiling water, as that was once my opinion. But I had reason afterwards of retracting, as I believe my neighbor injured his seed by so doing. The cockspur will not so easily vegetate-they are naturally a strong rugged growing shrub, and will make a strong hedge with good management; but the Virginia kind is easier managed in training. That part is essentially necessary, but too lengthy to say anything about in this communication.

Near Wilmington, Del., Feb. 28, 1831.

GRAFTING GRAPES

Mr Fessenden-Some of my friends succeeded remarkably well the last season, though a bad one for the purpose) in obtaining fine grapes by grafting. This mode of improving one of the most delicious and costly of our fruits, seems to me worthy general adoption. Into the vines or roots of ordinary and even native grapes, the black Hamburgh and other rich kinds may be engrafted, so as to bear in profusion and ripen the first year. Will some of your correspondents, with whom this subject is familiar, favor your readers with an accurate practical account of the proper season for engrafting grapes, the best scions, the different modes of performing the operation, and the subsequent management. If practical horticulturists are not in need information, it will be gratefully received at least by An Amateur.

Dutch Cheeses,-It is computed that 30 millions of pounds of cheeses are annually made in Holland; much of it goes to England. Edam in North Holland is celebrated for its trade in this article, 6,660,631 lbs. having been weighed there in one season. The two great divisions of Dutch Cheese are Sweet Milk and Curds. The Edam cheese is all sweet milk cheese, which is again divided, according to its rind, into red and white,

AGRICULTURE.

REPORTS OF THE

ESSEX AGRICULTURAL SOCIETY IN 1830.

I. ON THE MANAGEMENT OF FARMS.

The Committee of the Essex Agricultural Society on Farms beg leave to submit the following REPORT.

claimants for the Premiums of the Society for the best cultivated farms. Essex County, though inferior perhaps as a whole for the quality of its soil, might exhibit with a reasonable pride many examples of an intelligent, skilful, industrious, and successful husbandry; and it would have given your Committee great pleasure had they been invited to visit several establishments in the county which do honor to their cultivators, who, we regret to think, are deterred by an improper diffidence from Society. Agriculture presents one of those singular cases in which competition however excited can it; but on the contrary it may be productive of the greatest benefits both of an individual and a public the same farm. The rate too at which the work nature. Experiment is always the best teacher, Competition leads to experiments: it promotes improvements, and extends them after they have been discovered. In an honorable competition no generous mind should feel mortified with ill success. The attempt to excel brings its own reward with it; and a public-spirited mind will see that a successful competition inevitably contributes to advance the great cause itself, and reflects back upon the community advantages greater than it could receive from the acquisition of the most liberal premiums. Great benefits must arise from bringing our farms into comparison with each other; from seeing what can be done; from the knowledge of each other's improvements however humble; from liabits of exactness, experiments and observation; and especially from that strong interest in cultivation and improvement, which an extended competition cannot fail to excite and the tenant are successfully pursued, not only withmaintain. Your Committee know no better mode of applying the funds of the Society than in premiums for the best cultivated farms, which are found entitled to an honorary notice upon personal inspection; and they express to their brotherfarmers their earnest desire that another year may find the list of competitors for these prizes greatly enlarged. It is not the most extensive. showy, fertile, productive, nor expensive farms, which they would deem best entitled to their approbation; but those which present the fairest neatness, skill, and constant improvement: virtues within the reach of all, and which in their just combination constitute the true excellence of hasbandry.

Your Committee are unanimous in awarding the first premium of thirty dollars to Erastus Ware of Salem, tenant on what is known as the Pickman farm in the southeasterly part of the town. tenant, the late Mr Paul Upton, for several years was formerly the universal custom. the successful manager of the Salem Alms-House

ceffent condition. The general appearance of his of milk. It should be the great object of every fields, the good order of his fences and buildings, farmer to convert his produce into a condition the labors of so extensive an establishment have but never in that of hay, straw, or vegetables, been conducted, entitle him to the highest credit. We believe that leases are seldom given in Eng-

try, and, where several hands are employed, on performed away from the farm for hire was done is not known to the Committee; but that done for for labor at home. Still however the amount paid for labor on this farm, compared with the quantity of produce raised and marketed, and the amount of Live Stock kept, on any common estimate, must be considered as very small, and shows that it must have been faithfully exerted and judiciously applied.

Mr Ware's farm is not an experimental farm: his main object being to obtain the greatest pecuniary profit from the place consistently with a just regard to the interests of his landlord. The condition of the farm shows that the landlord can have little grounds for complaint; and it is highly gratifying to find an example, rare enough we must allow, in which the pecuniary interests of out detriment but with advantage to the interests and rights of the owner. The contrary course, however dishonorable and dishonest, is but too common; so that in general where a man lets his farm he must despair of its improvement; and a lease upon what is termed shares is too frequently a virtual renunciation of all claims to anything.

Though not an experimental farm, yet the observations of Mr Ware being the result of inexamples of industry, perseverance, economy, of hilling Indian corn confirms the suggestions eligible course; though it must be allowed, es-

tending its improvements and maintaining its ex- sell the greater part of his produce in the form corded at the time,

the condition and productiveness of his nursery that it may be disposed of without injury to the and orchards, the nearness prevailing in every de-place. This may be done in the form of milk. partment, and exemplary temperance with which, butter, cheese, beef, pork, mutton, wool, grain: -Making proper allowances for the amount of land without an express condition, that all the land occupied in pasturing, the greater part of hay and straw raised shall be consumed on the They regret to state that there were but two which is incapable of collivation, your committee place; and it is respectfully submitted to the deem the product of the farm very great; and consideration of the Society, whether some of especially when compared with the actual expense their premiums could be more advantageously beof labor. This seems small in any view and must stowed than in the encouragement of careful and have been applied with much skill and fidelity, exact experiments upon the value of any article though your committee would have been able to of agricultural produce in the fattening of hogs, judge more satisfactorily on the subject, and it sheep, or eattle; experiments that should go to would have been much more advantageous to the show not merely the pecuniary results which public, had the claimant stated the number of days' must of course be affected by many contingencies, work done or the number of hands and the time for that could neither be foreseen nor controlled, but which they were employed, rather than the pecun-the best course of feeding; the actual amount becoming competitors for the premiums of your lary cost of the labor, which for obvious reasons of food consumed and of flesh produced; and as can hardly form a rule by which others may gov- far as it can be ascertained the comparative value of ern themselves. The price of labor by the day or different kinds of vegetable food in its application do no harm; we see not what evil can result from month differs much in different parts of the coun- to the stall-feeding of animals. From the value received for the sale of hay or straw is obviously to be deducted the labor and expense of marketing and a sum equivalent to the value of the manure, which would be furnished to the farm by the town may be supposed to exceed the rate paid the consumption of such hay or straw at home. These are pretty serious deductions; and if any mode of applying a portion of our produce could be discovered, by which we might derive an equal advantage, as from the sale of it in the form of hay or straw, a most important point would be gained. Experiments on this subject, though on a small scale, are carnestly urged upon the Farmers of Essex, under the persuasion that any such experiments well and exactly conducted and detailed, though no specific premiums should be promised, would receive the particular notice and approbation of the Society.

Your Committee bave thought proper, and particularly with a view of encouraging competition for these premiums, to award the fifth premium of eighteen dollars to John Adams, Esq. of Andover, Mr Adams' statement is subjoined, in which they have to regret an almost total want of that exactness which the Committee deem highly important, Mr Adams' husbandry is respectable and the Committee were gratified with the general appearance of his farm; but they would have been much better satisfied to have been told the particular amount of his butter, cheese, pork, and hay, as near as it could be ascertained, and the unaber of cows kept, telligent and long experience, are entitled to great &c, than to have received the very general stateconsideration. His opinion against the practice ment of his keeping from twenty to twenty five cattle and selling about three bundred weight of which were made to the Society on former occa- butter and some cheese, and about ten hundred sions on this subject. His success in laying down weight of pork besides what he consumes in his his land to grass in the fall after taking off a crop family, and from ten to fifteen tons of English of early Potatoes deserves notice. There is an hay. In the disposal of these premiums the obvious convenience and there are many advanta- Committee feel that they are responsible to the ges in this management; we believe it the most Society and to the State; and they therefore should deem it indispensable in regard to all claims pecialy if the sowing in the fall is very late, that for premions that the statements of those who His full statement of his management and pro-there will be many weeds in the next year's crop apply for them should be given with as much exducts is subjoined, and will be read with interest of grass; and the hay will not be of that substanta across as possible. Butter, cheese, pork, vegetaand pleasure. The farm owes many of its im-tial quality that it would be, if the grass seed bles, and grain are all easily measured. Hay sold provements to the labor and skill of its former were sowed in the spring with English grain, as is of course weighed; and when not sold, the number of loads when carried from the field Mr Ware has singular advantages in his near-should be counted, and as fair an estimation of farm. Mr Ware is entitled to the credit of ex- ness to a market, and especially in being able to their weight as possible should be made and re-

The amount of labor expended on the farm of the ground which he plants, the quantity of seed Adams is equal to that of two men through year. This is very small, compared with the ent of the farm; and we take the occasion to ark that farmers as often mistake their true eep a teamster, whose business, should be to that team constantly, that none of the labor ch it can perform should be lost. Few of our ners seem to think that they may as well for r own interest let their men be idle as to let e team be idle without necessity; and on a e can seldom be any want of profitable em- in himself. ment for a team. Again, the profit of farming, it in your power to apply; but the quantity of are will on the other hand depend on the int of land cultivated and of produce grown. more land we cultivate, the more produce aise; the more produce we raise, the more ; we keep or fatten; the more stock, the more are to enrich the place. If our land is too than pay the expense of cultivation, it would etter to cultivate it, because judicious cultiun and improvement will not fail ultimately icke it profitable. Expensive as labor is among here certainly may be too many hands employtho may interfere with and embarrass each ; and from a neglect of constant oversight he judicious division of labor among men. ning every man his place and duty and as possible obliging him to attend in that place perform that duty, there is much waste of and much less work is oftentimes accomplishin with fewer men and more careful arranges; but where, on the other hand, a team must pt, which ought to be constantly employed, with the team the necessary appendages of ploughs and farming implements; and where o extra labor, house rent, or fuel will be re-I for the support of the men than if there fewer of them, there it would seem to be r to cultivate as much land as you can maand cultivate well, and to employ as many s within the above limits as can possibly be to work to advantage, Your Committee ore would deem it proper on their part not uire with how little labor a farmer can get , but to compare the labor employed with stent of the farm, the quantity of land under tation, and the amount of produce grown; pronounce that the best husbandry where bor employed, be it more or less, has been

d with the best judgment and profit. fur Committee avail themselves of the prebecasion to call the attention of their brother rs to the importance of keeping accounts. ny farmer make the experiment and he will as interesting as it is useful, and both interand useful to know from year to year the produce of his farm. Let everything therewhich can be measured and weighed, be meaand weighed; and let that, which cannot be ht to an exact standard, be estimated as himself were about to sell or purchase it.

which he uses, and the manure which he applies. The labor of doing this is nothing compared with the satisfaction of having done it, and the benefits which must arise from it. Conjecture in these rest in employing too little, as too much labor, leases is perfectly wild and uncertain, varying often ry farmer who keeps a team ought we think with different individuals almost a hundred per cent. Exactness enables a man to form conclusions, which may most essentially and in innumerable ways avail to his advantage. It is that alone which can give any value to his experience; it is that which will make his experience the sure basis of improvement. It will put it in his power to of a hundred acres or even fifty, in the con- give safe counsel to his friends, and it is the only in in which most of our farms are found, ground on which he can securely place confidence

Your Committee congratulate themselves and ere is any such thing, must depend on culti- the Society in the belief that the agriculture of in. The amount of cultivation should depend the County is in a state of improvement. It is true on the quantity of manure, which you very far from being what it should be; yet some examples of its farming and many instances of crops raised in the county will hold an honorable comparison with the farms and the crops of counties and countries much more highly favored by soil and climate. The County of Essex enjoying many advantages from its proximity to good markets and possessing an industrious, temperate, morto pay the expense of cultivation, then let it al, and intelligent population, may find in these bandoned. But where it will do but little blessings some compensation for the sterility of much of its soil; and in its general inprovements, and its agricultural and commercial facilities and advantages it presents to industrious, frugal, and enterprising citizens ample occasions for honest pride and grateful contentment.

Respectfully submitte I,

Jesse Putnam. HENRY COLMAN. JOSEPH KITTREDGE, Moses Newhall. JEREMIAH COLMAN. WM. P. ENDICOTT, J. W. PROCTOR.

January 4, 1831.

[To be continued]

CARROTS.

It appears not to be generally understood in this part of the country, that carrots are among the best and most nutritious food for cattle and horses. One bushel of carrots will yield more nourishment than two bushels of oats, or potatoes, and it is a remarkable fact, that horses will frequently leave oats to feed on carrots, after they have acquired a relish for them. -Generally, cattle as well as horses are very fond of them, and thrive astonishingly well, when fed upon them. They not only give them a fine flesh, but a rich brilliant gloss.

If our farmers would turn their attention to the raising of this vegetable extensively, they would find an immense saving in grain, as well as a visible change in the thrift of their animals. As a matter of economy and profit, it is of vast importance. The quantity of carrots which may be raised from one acre of good land, is almost incredible. Where the land is rich and mellow, an acre will yield from 1000 to 2,000 bushels. The process is simple, and the labor comparatively light.

Select a rich piece of ground, tolerably dry, and as free from weeds as possible; plough it deep, make it mellow, and harrow it smooth. Then sow your ground with the usual quantity of flax seed, and harrow it in ; after this, sow about a im likewise, as near as possible, measure the quart of carrot seed to the acre and bush it lightly. I titute of foundation.

Both seeds will come up together, but the flax springing up with considerable rapidity, while so shade the carrots that they will not gain souch size till the flax is pulled. The shade of the flax, will also prevent the weeds from growing, -c as to interfere with the carrots. After the flex is pulled, which will be in July, the carrots will begin to enlarge rapidly, especially if the weeds have been kept in check by the shade, for the onlling of the flax will so loosen the earth around them, and so expose them to the rays of the sun. as to give them new vigor and strength. At that time also, the weeds will not grow rapidly, if at all.

Thus may be raised two valuable crops without impoverishing the land, more than by a crop of

It is not probable that the first attempt would yield so largely as I have suggested above, but if you take the proper precautions, and are tolerably successful, your will realize from one acre about 1,000 bushels of carrots, worth three shillings per \$37: 00 300 lbs, flax. 10 cents per lb. 30.00

6 bush, flax-seed, 874 cts, per bush.

Total

5 25 \$416.25

To what use can an acre of land be applied, by which it will produce half the amount.-This may seem a large estimate, but it is nevertheless true; and if you wish to test the matter, try it next season.

Horses will work on carrots, nearly or quite as well as on oats, and keep in much better order. The transportation lines along the Canal, would find great economy in using them as a substitute for oats .- Genesee Farmer.

SPINNING FLAX BY MACHINERY.

It is not generally understood that flax is spun by machinery, although most of the Irish linen sold in our markets is manufactured in that way. On the 12th of July, 1823, I visited the Linen Manufacturing establishment of Mr Crossthwait (banker of Dublin) at Lucan, about seven miles from the city. At this establishment was manufactured 5 tons of flax per week, earrying it through the spinning, weaving, and bleaching processes. The machinery was quite as simple as that for spinning cotton, and less expensive. The spindles turned about three thousand times per minute, and one girl tended about eighty of them, which spun from one hundred to one hundred and twenty runs per day. I also examined about two hundred tons of flax, a part of which was Russian, and the remainder Irish. The Riga Flax, Mr Crossthwait informed me, cost from filly to sixty pounds sterling per ton. The Tandarage flax cost eighty pounds per ton which is nearly eighteen eents per pound. The same season flax was worth only about ten cents per pound, in most parts of the United States,-For manufacturing, water-rotted flax only is used in Ireland, as dew-rotted is not considered worth working.—Ib.

Note .- If the frish Manufacturers can afford to pay eighteen cents for a pound of flax to manufacure to send to America, what profit could the Yankees make in the same business when they could buy the flax for half the money?

The Nerves,-By the assistance of a newly invented galvanometer, of a very delicate construction, it has been ascertained that the hypothesis of the existence of electric currents in the nerves, is des-

ent for the gardener, who wishes to make his busi- sowed broad cast, moderately thin, raked in light- ments in agriculture which have conferred such ness either profitable or pleasant, to prepare hot- ly and even, or in drills from a foot to sixteen portant advantages on the northern section of heds for forcing vegetation. Hot beds are not inches apart. It is said that the straight leaved United States, to require any encombians from merely articles of luxury, as has been supposed sort is best cultivated in broad cast, and does not by some, but are of real and considerable utility, require transplanting, but the curled and head Pattern Farm and a Sample Farm, in which especially for those farmers and gardeners who lettuce are said to succeed best when transplanted, best specimens of every kind of improvement of send their productions to market. Plants which are brought to maturity in the open air, may often be rendered fit for the table a month earlier in consequence of being sown, and forwarded during the earlier stages of their existence in a hot bed. The most plain and simple directions for making hot beds, which we remember to have seen are the following from the Farmer's Manual,

'Mark out your bed to the size of the frame you design to cover it, which is generally six feet the least room. For summer crops and large in length and three in breadth, covered with glass set in sashes of 12 panes each of 7 by 9 glass. These sashes are hing with binges upon the back side, to admit of their being raised up and let down at pleasure. The front side of the sashes, to incline from the back side about six inches The frame or box is tight upon all four of its sides, and generally about 12 inches high in front, and 18 inches on the back side.

Dig your bed thus marked off and cover it with litter from your horse-stable; stamp down cucumbers we must have recourse to artificial heat, your several layers, until your bed is raised to the height you wish, then cover the bed with a layer of rich earth, from 6 to 12 inches thick, and set on your frame; in 8 or 10 days it will generally be ready for planting, if the weather is mild. If the fermentation is too powerful and the heat too actave, give it air by raising the lights in your frame untily on have obtained a right temperature :(which you may determine by placing your hand upon the bed, or even thrusting your hand into it.) You may then plant your early encumbers, radishes, salads, &c; these plants will soon come forward, instead of the ordinary difficulty of separating the and may be transplanted on to other hot beds, not so powerful, or set promiscuously in the garden and covered with other small frames, of 1, 2, or 4 panes of glass according to circumstances, and the remainder may stand for use.. These plants may be brought to perfection, generally, about one month earlier than in the open ground.

. Isparagus may be forced in hot beds to advantage in the following manner. Draw or dig from your asparagus-bed as many roots as will fill your hot-beds, and set them in rows that will admit the hoe between, and from one to three inches asunder in the rows, (roots of four years old, and that have never been cut, answer best;) cover with your frames, and when you pick for use cut within the ground.

In the cultivation of sweet potatocs it is best to start them in a hot bed, and afterwards transplant them, by which a good crop it is said may be obtained in our northern climate. Other modes of of live stock; and combining with these the busimaking hot beds may be seen in New England ness of Agriculture and Horticulture, upon the dener, page 161.

Lettuce may be sowed in the open ground as Horses,' &c, and it is proposed moreover, if st soon as frost will permit. To obtain a constant cient encouragement should be given that a v supply of good lettuce it is serviceable to sow it educated Veterinary Surgeon may be attached every month from the opening of Spring till Au- the establishment. The whole will be under gust. For a seed-bed, four feet wide by ten feet care and superintendence of Col. Samuel Jaqt In New England we are generally precluded in length, a quarter of an ounce of seed is sufficient of Charlestown, whose name alone is a sufficient plants. It may likewise be sowed between va- and enlightened manner. His qualifications out for use before the other plants are large enough appreciated by every person, who is in the slig As soon as the frost subsides it will be expedit to be encumbered by it. The seeds may be either, est degree acquainted with the recent impro

ground is thawed. Of the small early kinds, one and every species of Rural Economy, will be pint will sow a row of twenty yards; for the lar- Instrated by inspection, explained by exhibiti ger sorts, for main crops, the same measure will and shown to be practicable by ocular demons sow a row of thirtythree yards. For early sorts tion. Those who may not comprehend theor make the drills one inch and a half deep; and or may not believe statements, will there be 1 let parallel drills be two feet and a half, three or mished with evidence which cannot be contradic four feet asunder, according to the sort, and the soil. Peas that are to grow without sticks require sorts, make the drills two inches deep, and four, five or six feet asunder, and distribute them along the drill according to their size and the richness of the soil, which should be light, loose, and mod- in which lessons will be given gratis from wh erately rich. But peas are rather injured than the most scientific may derive profit, and the n benefited by fresh stable dung.

Cucumbers .- In a Treatise on Gardening, by J. Armstrong, Duchess County, N. Y. published in Memoirs of the New York Board of Agriculture, we have the following passage: 'To obtain early and with the less reluctance, as, of all plants, the cucumber is that with which it best agrees. this end, therefore scoop as many large turnips as you propose to have hills-fill these with good garden mould, sow in each three or four seeds and plunge them into a hot-bed. When the runners show themselves, spare them, or pinch them or bury them as you think best; and on the 10th of May transfer them to the beds where they are to stand. The advantage of a scooped turnip as a seed hed over pots or vises will now appear-for mass of earth and the plant from the pot which contained them, and without injury to either, we re-inter both pot and plant, and even find in the one an additional nutriment to the other. The subsequent treatment does not differ at all from that of plants cultivated in the open air.' Other plants, such as summer squashes, melons, early corn, &c, &c, night no doubt be forwarded to great advantage by means similar to those above stated.

STOCK FARM IN THE VICINITY OF BOS. TON.

We have seen and perused with much pleasure and entire approbation a 'Prospectus of a proposed Stock Farm,' to be established in the vicinity of Boston, and to be ' devoted to the important object of breeding and rearing the best breeds of Horses, Neat cattle, Sheep and Swine ; the receiving and selling on commission all kinds Farmer, vol. vi. p. 277, and New American Gar- most approved and economical system. The business also of disciplining young and refractory animals may be fairly tested by comparison w

This place will be not only a Stock Farm, bu Early peas cannot be planted too soon after the nected with the arts of Agriculture, Horticultu and explanations which cannot be misunderste The whole farm, together with its buildings well as its stock and utensils, will furnish a Ly um, Arena, or Hall of Agricultural and Hortitural Science, furnished with appropriate appr tus, which will always be open to the public, ignorant may fully comprehend.

It is intended to have concentrated at farm the most esteemed varieties of anin now known in Europe and America. Liberal intelligent Merchants, Officers of the U. S. No Captains of Vessels, &e, &e, will find on Janues' Stock Farm, a place where they can de sit whatever productions of foreign countries, s as rare and useful animals, plants, &c, they t be disposed to import either for their own eme ment, or for the benefit of their country. But advantages to be anticipated from an establishm of this kind, are too obvious and too numerous require or to admit of recapitulation. We therefore happy to perceive that the plan is wan recommended by the Trustees of the Massac setts Agricultural Society and by the Hon. Je LOWELL, late President of the Society; andt the liberal and enlightened capitalists of Bos and its vicinity have taken such a number of she in the establishment, that no doubt remains of being immediately carried into effect.

Since the foregoing was written, we have received following letter from His Excellency Gov. Linco. whose opinion on agricultural subjects is worthy highest consideration.

Boston, March 8, 163

COLONEL JAQUES.

SIR-Having examined your proposals for establishment of a Stock Farm, I take g pleasure in expressing to you my cordial approbat of the plan, with my best wishes for your success so important and interesting an undertaking. W the skill and experience which you possess, in rearing and management of stock, the public 1 have a reasonable assurance that there will be best selection of domestic animals of every desira race; and in the variety which such an establi ment will present, the occasions and preferences Farmers for Breeds of Cattle suited to different jects, will be abundantly satisfied. I know of no rangement in rural affairs more important than t by which the properties of the breeds of dome n other, under the same course of keeping and hagement. No two breeders will be found to and treat their stock in the same manner .nce the great uncertainty, as well as diversity, in results of practical observation. Inferior anis, by more care, are often made to appear better, give a greater product than others of decidedly rior qualities, with less attention. But by coling individuals of different races into one estabment, and subjecting them to uniform treatment, er the same careful inspection, their characterdifferences will be ascertained, and the pecuproperties which recommend them for different and purposes of economy, will become well untood. The Feeder will learn how to select for pasture and the stall. The Husbandman, who s for strength, activity, and hardihood under the , will not meet frequent and mischievous disaptments; and the Dairy will be sure of its pro-

ne benefit of such opportunity for comparison and election, in conformity with the particular interof each purchaser, will be equally experienced lose, who are engaged in the rearing of Horses, p, and Swine, with all which, as much as with ned Cattle, it is now well understood, there lies entire difference, in different breeds, between · worthlessness, and great productiveness and 2. Indeed I cannot but indulge much confidence, in the utility of your scheme to the public, and s rewards to your own excellent spirit and enize. I mean this remark should apply to your e plan; as well to the part which respects the se of Husbandry proposed on the land, as to the ling and keeping of Animals; although, as I am acquainted with the precise character of the which you have selected, I beg to decline ofrg any opinion, as to the particular purchase, or mount of the investment, which may be required ie Establishment. Your ob't serv't,

LEVI LINCOLN.

ORTICULTURAL HALL, MARCH 5, 1831.

s following plants in flower, were exhibited by Daaggerston, Charlestown Vineyard: - Camellia Saea Rosea; Camellia welbankii; Camellia Greville's Camellia Paoniflora; Camellia Pallida; Camellia ubens; Pelargonium Feronia; Azalia Indica Coc-Do. purpurea; Acacia armata; Pæonia moutan.

R. L. EMMONS, Chairman.

are happy to learn that the whole of the Lowell oston Rail Road Stock has been subscribed for, and the Company will be immediately organized and m ence operations.

Lesum of \$130,000 has been subscribed to the Worand Boston Rail Road.

CORRESPONDENTS .- We have but room enough apologize to six or seven Correspondents, for the on of their favors, which shall be attended to next

NEW CATALOGUE-PRICES REDUCED.

wan Botanie Garden & Nurseries-Flushing

near New York.

WILLIAM PRINCE & SONS, Proprietors, announce, that the great extensions made in their Establishment, which now covers near es, compactly filled with the choicest Trees, Shrubs Plants,-has enabled them to reduce the prices for is kinds; and their . Vew Catalogue with the reprices, will speedily be presented to the public,— it may be obtained of the various Agents, or by apg direct to themselves per mail. The greatest atn and unwearied scrutiny have been exercised in I to the quality and accuracy of their trees, and they a larger size than at any previous period. Aware he establishment of Nurseries in every part of our ry would be a National advantage, they will fur-all supplies for such purposes at a liberal discount, t a credit to comport with the convenience of the asers. Any information desired will be furnished return of mail, and all orders, &c, will receive the tomed attention and despatch. Orders can be sent March 9. any other Agent.

Dry Goods.

Also, a fine mileh COW, with her ealf; a superior animal as a milker, and perfectly gentle.

Feb. 23.

White Mulberry Seed.

For sale at the Seed Store connected with the New England Farmer, 52 North Market street-

A small quantity of fresh White Mulberry Seed, of the growth of 1830. Gentlemen in want of this Seed that can be depended upon, are advised to apply soon, as the supply here, and throughout the country, is uncommonly small .- Short directions for its culture furnished gratis with the seed.

.Immunition 3

Of the best quality and lowest prices, for sporting— 65 Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be refunded. tt Jan. 7.

Durham Short Horns.

For sale, several of the pure breed, descendants of the celebrated animals presented by ADMIRAL SIR ISAAC COFFIN, to the Massachusetts Society for the Promotion of Agriculture. The pedigree of these animals can be given as far back as *Hubback*, who was calved in 1777, and is reputed the foundation of this much admired stock. Also, several Heifers bred from the same, of various grades, from half up to seven eighths blooded animals. For particulars, inquire of E. Hersev Derby, Salem. Salem, October, 1830.

Farmer Wanted.

A single or married man is wanted to manage a farm in a very pleasant village about 45 miles from Boston. He must thoroughly understand his business; be acquainted with marketing, and produce the best recommendations as to his industry and fidelity. Address J. B. Russell, Seedsman, Boston, (post paid). Feb. 23.

BRIGHTON MARKET-Monday, March 7. [Reported for the Chronicle and Patriot.]

At Market this day, 142 Beef Cattle, (including 27 unsold last week,) I pair of Working Oxen, 10 Cows and Calves, and 152 Swine-55 Swine were included last week.

PRICES.-Beef Cattle-An advance of about 25 cts. per cwt. was effected from last week. We noticed only one pair prime Cattle, sale not effected-\$6 was asked; we shall quote from 4 25 to 5 25. Should the market for a week or two continue open, (as may be the case) our friends from the 'River' will probably find as good a market at Brighton as at New York.

Working Oven-In demand; many buyers were disappointed at not finding any which were good at market.

Cove and Calves—We noticed sales at 19, 21, and \$22.

Sheep-None.

Swine-Not much doing; too high a price appears to be asked. A few at retail were taken at 5c. for Sows, and 6 for Barrows.

New York Cattle Market, Feb. 28 .- At market, this day, 230 Beef Cattle, and 250 to 300 Sheep. Number of Cattle much less this week than usual, demand of course greater, and price advanced; a few pairs show Cattle sold for \$10; several small lots extra 71 a 8; good 61 a 5 a 51c. weighed alive .- Journal of Commerce.

HISCELLANY.

following method of extracting a blue acidying from buck wheat straw, is from a adon geriodical:

straw should be gathered before the grain is or a dry, and placed on the ground to the sun, The becomes sufficiently dry to be taken from has swith facility. The wheat having been , the straw is to be piled up, moistened to ferment till it is in a state of decompoau III. - the period when it should be gathered, ed into cakes, which are to be dried n, or in a stove. On these cakes being water, the water assumes a strong blue hai ich will not change either in vinegar or aric acid. It may however, be turned into a alkali, into a light black with bruised gall 13111 tinto a beautiful green by evaporation. d blue with the solution, which is to be or same way as vegetable matters of a cies employed in dving, become of a and durable color.

To porent Milk becoming sour .- To prevent in ". turning som and curdling as it is so ant are heat of summer the milk-men of Paris all a still quantity of sub-earbonate of potash or s also such saturating the acetic acid as it forms, pr . a ... coagulation or separation of curds, of them practise this with so much sucor gain the reputation of selling milk that or the Often when coagulation has taken or y restore the fluidity by a greater or less addition of one or the other of the fixed alkalies. The acctate which is thus formed has no ingerless effects and, besides, milk contains naturalica small quantity of acctate, but not an atom of re: l' a varbonated alkali.

securing timber from decay.—Timber for budges, especially for ships, bridges, canals, grafian sand stables may be effectually preserved from decay and particularly from the rot, by repeatedly impregnating the wood with a solution or common salt and green copperas.-This simple p. 10.85 is attended with such decided advantage that wood thus prepared will remain for ages, personly sound.

An inscance of this fact occurred in the theatre at Copeal agen, where the lower part of the planks an Ljoists formerly required to be replaced in a few years all Mr Volmeister, an architect of that city, discovered and employed the process above stated. Twilve years after, the wood, on removing one of the boards, was found in such a state of preservation that he could not observe the least appearance of decay .- English Publication.

Wood unpregnated with alum, salt or copperas is also rendered in a great degree incombustible as is also rendered in a great degree incombustible as sale nally, wearing flained round it at the same time. It well as incorruptible. When thus prepared it proves most effectual when applied early.—The may be charred or consumed by intense heat, but Mirror. ean scarcely be made to blaze, and of course would not readily communicate fire to other objects lard till quite brown, and then separated by a strainin its vicinity.

themselv's, that nothing can be made by agriculturists. That this numerous and respectable portion of our citizens, taken as a whole, do in fact take little or nothing more than a bare support for themselves and families, cannot be denied .-

But this does not prove the incapability of their business being made lucrative when properly conducted. Its unprofitableness there is reason to believe is to be attributed principally to an injudicious and mistaken policy in conducting it, or to a carelessness and inattention in cultivating it. Among the common bilions fevers which often afflict the to the capital errors of our practical farmers may be ranked a disregard to manuring and tilling their land sufficiently. Although much has already been said on this subject, yet it is one that cannot be too often brought in view, so long as the preshen it will become of a blue color, this ent system is pursued. Many of our farmers attempt to improve more land than they can attend advantageously. If they would expend all the labor and manure on one third, or at most one half the quantity of land they now do, they would in most instances obtain twentyfive or fifty per cent more produce; and the danger of a total failure in ing-the Apple tree thraving very well in this cou their crops greatly lessened,

> Lotteries, -A respectable gentleman of the Society of Friends in this city relates the following ineident: A farmer of his acquaintance in the country called on him to procure a loan of three thousand dollars, on a mortgage of his valuable farm. The gentleman had the money to spare-was satisfied with the security-and was free to accommodate his old acquaintance. But he wondered exceedingly why the money was needed. After much inquiry the fact was elicited. The farmer was in-

lic awake to this subject! While millions and millions of these moonshine fortunes are annually sold in this city, and while every village of note in the interior is inundated with them, many good people are flattering themselves that the evil is principally confined to the city !-No such thing. A great part goes into the country-and many a farm is gambled away in this manner .- V. Y. Gen. of Planters of the Western States, that he has just arri

OUR ARMY .- The following is an account of the standing Army of the United States, extracted from the last Report of the Scretary at War. It presents a force of 6188 persons engaged for all the military service of 13,000,000 of people, extended over a square of 2000 miles. What will Europe think of such an army? Surely our nation must have its defence in the hearts of millions of good citizen republicans, and in the Arm of the Almighty .-- Phila-

ITEMS FOR HOUSEKEEPERS.

To remove ice from door steps, &c, throw upon it a small quantity of salt, and the ice will directly crack and become loose, and may be easily removed with a shovel.

Recipe for a sore throat.—Take a glass of elive or sweet oil, and half a glass of spirits of turpentine; mix them together, and rub the throat exter-

A salve made of carrots grated fine, simmered in er, is considered excellent for chilblains.

If a fellon or runround be coming on your finger, A givultural.-It is often asserted, by farmers you can do nothing better than to soak it thoroughly in hot lye.

Lard which has been melted and cooled in fresh water four or five times in succession, and then simmered with sliced onions, and strained, makes a most excellent salve for wounds inflamed by taking cold. -Frugal Housewife,

Vuluable and Cheap Land-for Sale.

The subscriber offers for sale, 14,000 acres of che Land, situated in the town of Pinckney, county of Le and state of New York. Some of the land is impresand under cultivation. The country is remarkably h thy, being entirely free from the fever and ague and I upon Lake Ontario, this town being 18 miles east of take. The soil is principally a sandy loam, much covered with rich black mould. The timber is chi Sugar Maple, Black Ash, Butternut, Beech, Elm, The land yields first rate crops of Grass, Rye, Oats, ley. Potatoes and Flax; and on some lots, good WI and Corn may be grown. To those wishing to obtain perior grazing farms, a fine opportunity now offers its The produce of pasturage and hay from an acre of Land, is very large, fully equalling if not surpassing from the same quantity of land in any other of the Bl River townships. The land is admirably well water there being but few lots which have not durable runt streams upon them. The land is well adapted to Orch; Stock of all kinds may be disposed of with the least po ble trouble, and to the greatest advantage, the dro purchasing at the very doors of the farmers, and pay the highest cash prices for their cattle, which will rea find purchasers at all seasons of the year. Several mers at present residing on this town, were origin from the New England States, and some of them f Massachusetts, who are in thriving circumstances. above described land is offered for sale at the very price of from two dollars and a half to three dollars acte, for the uncleared land, and from three dollars at half to five dollars and a half for the improved lots. land will be sold in lots to suit purchasers, and from to five years' credit for payment, in annual instalme will be given. FOR THE NEW ENGLAND FARMER.

SALTHAY

R Pessexuex-I have no wish to enter the in the salt hay controversy. But I can state facts, which may throw light on the subject, serve in a measure to reconcile the apparent adictions, that have appeared in relation value. From the several articles you have shed, it is evident there is a considerable sity of opinion, both on its intrinsic and relavalue, not only with those who profess not knowledge on the subject, but among expeed men and good judges. This arises, I pre-, for the most pari, from not duly regarding et, that there is very great veriety of salt es differing essemially in value. I have many seed extensive tracts of salt marsh covered lifferent kinds of short, hard and wiry grass, I I would not make into hay, and secure in or stack for the emice crop, unless in a senson tat scacelly. Again, there are many kinds luable, that, cartle, horses and sheep being s, (and I have always been in the habit of g great deference to them as the best judges quality of hav.) I am not slow to believe night even be preferred to English hay. For ive years or more I have had opportunity iess the value of salt hay, by feeding came ng them fed with it. My honored fatter te John Capen, of Dorchester, raised much kind called black grass from its dark color growing, and made into hay, which, for cows, working oxen, and for horses oceay, he used to consider but little, if any, less le, than English hav, if cut in the flower Il cured. There is a kind still better which is light color I have been used to call white I believe it is more properly called goose It is a very early grass, usually found on narshes, by the side of creeks, or such as

een rendered more firm by ditching. new of marshes which a few years ago barren as scarcely to be worth mowing: being intersected with narrow ditches two e rods apart, have changed to this grass;

two toos to the acre, of hay worth as (I say it not in jest) as English hay.

en I resided in Dorchester, about ten years hired a piece of marsh, where there was a rable quantity of this grass. This was o the baru promisenously, with the other I once tied a friend's horse in the barn floor, at English hay, as I thought. Going to the while after, I found he had rejected the a bay, and taken the liberty to help himself, milk, which to many is very unpleasant, made a spacious excavation into the salt ow. This horse had long been kept near iter on a farm where salt hay was no rarity. ered at the the animal's taste. But in such if ever, it was true ' de gustibus non est ndum;' There was no disputing with him ffair of taste. Upon examination, I found the goose grass, he was regaling himself

These two kinds, the goose grass and black grass, then ent in season and well cured, are very highly and richly fragrant. They produce abundant crops, are very leader and soft to the months of catcle, and very greedily eacen. Many other kinds, of which I know not the botanic name such as blue gross, a matted grass called bottom grass, the short sidges, &c, make excellent hay. The far grass, a red topped grass, if not cut early, is too hard and woody, almost bidding defiance to steel or ivory. I have uniformly noticed, that eattle kept upon salt hay always look in good condition. While those kept upon tresh hav may generally be known by their long hair, bare bones, and thin and ghastly appearance.

There seems to be a very general prejudice against feeding milch cows with salt hay which I think is not entirely well founded. I would by no means recommend its exclusive use, nor do I think it so productive of milk as rowen, clover cut early and well secured, or the finer kinds of English grass. For the last twelve years, having fixed near and owned salt marsh, I have very freely fed my mileh cows upon salt hay, and am satisfied, that upon good salt hay, with the addition of a few vegetables, they will give as much milk, of as good quality, will hold out in milk as long, and keep in as good condition as upon common English hay, and the same quantity of ve stables. In the winter of 1824, I kept a cow be ly apparall hay of the common mixed kinds of grass, with the addition of from a peck to a half bushel of carrots, and usually some meal or bran, not exceeding two quarts of the former, nor half a peck of the latter, a day. The cow had given milk from the first of May and was expected to calve again in April. The milk she gave, during the three winter months yielded a very small fraction less than seven pounds of batter a week, nearly as rich in color and flavor, as summer but-

It is a well known fact that cows pastured upon islands, or near the salt water, where they can feed partly upon salt grasses yield milk in abundance and of the best quality,

To conclude this article, which I have mexpectedly prolonged, I will refer the classical nich produce an average, I should judge, of reader to a sentiment which has lost none of its value by age, though older than the Christian era. The correct doctrine upon the use of salt havis lain down in Virgil, Georgic 3d, 394-and which the lover, of milk, eni lactis amor, will still do well to observe.* Together with other succelent food he will furnish his cows with salt hay in their stalls. This will not increase their appetite for salt hay mow side, and gave him a baiting of drink, and add to the quantity of their milk; but Territory, north of Illinois and west of Green Bay, improve its flavor, by imparting a relish and thus correcting that peculiar freshness, often found in

South Boston, March 2, 1831. L. CAPEN,

* The passage alluded to is as follows: At cui lactis amor evtisum lotosque frequentes Ipse manu salsasque ferat prasepibus herbas. Which may be thus rendered.

> Whose on milk deliciously would fare. Lentils and clover to his kine will bear, And saline herbage liberally provide To swell the fuscious and salubrious tide .- ED.

LIVE FENCES.

Mr Fesesnber The plants of the Virginia Thorn of one year's growth can be obtained of Mr Joshua Peirce, Linnaan Hill, near Washington City, of fine growth from 12 to 21 inches high for \$5 a 1000 and from S to 10 inches for \$4, and if 10,000 or more are taken one dollar will be deducted per 1000 on each size. When plants are brought from such a distance, or when the roots appear to have dried in the least, or the land is not in a fit state of preparation for immediate planting they should be soaked in thick water one night, and the next day put in a trench and the roots should be covered with rich, friable unadhesive earth and well drenched every 2 or 3 days with water, and when taken up for setting, let them have another night's soaking. This is called puddling and trenching. Those I had of Mr Peirce in 1818, I soaked the night previous to setting, in tubs and buckets with fresh, new adhesive cattle mannie, and carried them in the same vessels to the place of setting, laid them in the trench, and covered the roots while wet, and did not lose one out of a hun-

William Pontey, nursery man and forest pruner to the Duke of Bedford and a director of plantations and other improvements says in his Profitable Planter, page 167, A puddle for trees is made by mixing water "the ty soil rather tenacious, so intimately as to form a complete puddle, so thick that when the plants are dipped into it, enough may remain upon the roots to cover them. The process of puddling is certainly simple, and its expense too trifling to deserve notice; its effects, however, in retaining, if not attracting moisture, are such that, by means of it, late planting is rendered abundantly more safe than it otherwise would be. It is an old invention, and hence it is truly astonishing that it is not more frequently practised. If people were to adopt it generally in spring planning, the prejudice in favor of autunn planting would soon be done away.' I have written to Mr Peirce for 4000 plants to set this spring, and hope to be able to set 10,000 or more next spring. Yours, respectfully,

Boston, Feb. 1831. BENJAMIN SHURTLEEF.

FOR THE NEW ENGLAND FARMER.

WILD RICE.

MR FESSENDEN-The following extract from Gilleland's 'Ohio and and Mississippi Pilot' may nerhans be interesting to some of your readers. 'Among the vegetable productions of the Western on the Onisconsin and Fox rivers, the Wild Rice, called Folle avoine by the French, and Menomen by the Indians, claims particular attention. It grows in inexhaustible abundance, through all parts of the territory, in almost every one of the in numerable lakes, ponds, bays, rivers, and creeks. It is said to be as palatable and as nourishing as common rice, and if so, it will be incomparably more valuable. It grows where the water is from four to six feet deep, and where the bottom is not hard or sandy. It rises above the surface of the water from four to eight feet, and is often so thick as to

prevent canoes from passing through among it. The stalk is soft like the bulrush, but grows in joints like the reed cane, which it much resembles. It is usual for the Indians to force their canoes through it (just before it ripens) and tie it in large bunches for the purpose of preventing the wild ducks and geese from breaking it down and destroying it. When it is fully ripe, they pass through it again, and spreading their blankets in the inside of their canoes, they hend the bunches of the wild rice over them, and thresh off the grain with sticks; an operation which requires little time, and is generally performed by the women. After drying it in the sun, they put it into skins, for future use. This singular spontaneous grain grows nowhere south of the Illinois river, nor east of Sandusky bay. Every autumn and spring the wild ducks and geese resort to the wild rice lakes in flocks incredibly numerous. The Menomonics (Folles Avoines or Rice eaters) who live in this part of the country are distinguished for their comeliness.'

possessed by the individuals of this tribe be in part attributed to the frequent and long continued use of this kind of rice? Professor Bigelow in his Collection of Plants, has given the following description of this under the name of Canada Rice, (Zizania aquatica).

This interesting plant grows in deep water at the edges of ponds and sluggish streams. It resembles at a distance, slender shoots of Indian corn, but often grows to the height of five or six feet from the bottom. Culm jointed, as large as the little finger. Leaves broad-linear. Panicle a foot or more in length, the k wer branches with tial account. I have been thus particular that the spreading barren flowers, the upper with appressed, crect fertile ones. The seeds are blackish, smooth, narrow, cylindrical, about three quarters of an inch long, decidions; within they are white and farinaceous. It is found in a brook near the Punch bowl, Brookline; in the brook which divides Cambridge from West Cambridge; in July, Aug. The Zizania will probably at some day be an object of cultivation, since it affords a means of rendering useful large tracts of inundated ground, and stagnant water. Horses appear to be fond of it, and no plant employed as forage, offers a larg-

The grain afforded by this plant has the qualities of rice, and is yielded in large quantity. It is however very deciduous, and on this account diffiault to collect, since the seeds drop into the water clmost as soon as they are ripe.

Perhaps some of your correspondents or subscribers can furnish some further light upon this subject, and will be so obliging as to inform us whether the culture and growth of this plant has been commenced or attempted in any part of New England. There are many ponds, lakes and rivers in the Eastern States having muldy bottoms and a suitable depth of water, now unproductive, where this nutritious kind of grain might be raised with little expense. The seed could undoubtedly be introduced by public spirited gentlemen who visit Detroit, or its vicinity, or by not be got into the ground too early after the fro-t some seedsman through some of the traders in Michigan. And if this species has the valuable properties of the common rice, the introduction and cultivation of it is certainly a desideratum, and may be reafter become a source of additional Novus Strictor. wealth to New England.

FOR THE NEW ENGLAND FARMER.

LEGHORN WHEAT.

MR FESSENDEN-It may probably be recollected by some of your numerous readers that I offered a few remarks some time, since through the medium of your paper relative to some experiments made with the Leghorn Wheat. Further experiments justify the conclusion that our climate is not congenial to the production of the beautiful material. known by the name of Legborn Straw, in any good degree of perfection; yet it appears to be a kind well adapted for the furnishing of the more important one, viz. the Staff of Life. That no error way arise as respects the particular kind, I would observe that a too treacherous memory led me to state in my former communication that the original seed was purchased at Mr Russell's seed store, and requested that the date of the year when purchased (which I left blank) might be filled up by yourself, not doubting the correctness of my statement; this blank was accordingly filled May not the superiority of form and complexion agreeing with the date of the year when Mr Russell had it for sale. This date was 3 or 4 years subsequent to the time that I purchased the original pint and consequently rendered some part of my communication prefectly irreconcilable. To the hest of my recollection, now a diplomatic gentleman," belonging to our government then at some court in Europe, procured one or two bushels of this wheat at or near Leghorn which, with the mode of culture, was transmitted to New England, and the seed, or a part at least, was placed in the hands of some seedsman in Boston for sale, at 33 cents per quart. Having sent instead of purchasing it myself. I am unable to give a more circumstantwo kinds, viz. the one I purchased, and that sold by yourself might not become confounded together and also to learn if possible how others have succeeded.

Further attempts, Lthink, warrant the conclusion that it is a valuable acquisition. The last season 82 rods produced 133 bushels of clear wheat, weighing at this time sixtyfour lbs. per bushel; the near vicinity of the field to the barn gave a number of fowls an opportunity of laying it under severe contribution which continued until threshed, from which it may be reasonable to conclude that the whole product would have amounted to 15 bushels, at least. This was sown on land which had been comparatively well manured for two seasons previous, and mostly planted with potatoes; but no manure of any kind was applied the last sea-

The effects of high manuring at the time of sowing appears to produce a great and luxurious growth of straw, but rather a diminution of grain. Although perhaps land could not be made too rich by the application of manure in previous years, as the same would then become completely incorporated with the soil. But one experiment has been made by sowing it with grass seed, and that one answered the most sanguine expectations, both as to grain and grass.

It need not probably be stated that wheat cauis out, and the land becomes sufficiently dry to

[* Mr Davis probably allodes to the Leghorn wheat sent home in 1821 by Mr Appleton then United States consul at Leghorn, See Hon, Samuel Dana's letter to the Editor of the New England Farmer, vol. 1., page 212 cn off, and often splitting the trunk to the bo -EDITOR.]

The method adopted previous to sowing been to wash the seed and while wet apply much air slacked lime as would adhere to grain; this has been left in a heap from 6 to hours. No one car of smut has been observed any season, and no disease whatever, except t a few snaws scattered over the field appea sickly soon after heading out; in these, after so fruitless attempts to ascertain the cause, w found, commonly at the first joint from the t within the cavity, a very minute worm, exceeding small, but whose ravages had cut off all co munication between the root and head, My norance of entomology and the attacks of insin wheat prevent me from determining whether be a new unwelcome guest or whether it be same species that is found under similar circ stances in rye while growing.

Whether the above describe I kind of wl possesses any decided superiority over other ki-I am unable to determine, having never raised other, but the prevailing opinion in this vicinit that common wheat cannot be raised to advant as it is subject to blast and mildew. If this o ion be well founded, this kind then does posse very decided superiority, if future experim produce the like effects as have heretofore res ed. Should any of your numerous readers ! ever attempted to cultivate this kind of w either for the straw or grain it would be pecu ly gratifying to learn the results of their exp

TO KEEP MICE FROM PEACH TREES.

Your Brookline correspondent respecting depredation of mice cating the bark of his pe trees brings to mind an incident which happe 8 or 10 years since; during that winter the s remained several weeks around a number of peach trees, in consequence of which a nut were either killed or much injured by the r One fine tree was completely girdled excepti small space on one side, which was saved, in sequence of a small longitudinal gravel stone b accidentally placed perpendicularly against tree : taking the hint from this occurrence and ing a small quantity of gravel around those ; most exposed so as to form an elevation nex the trunk of 2 or 3 inches, it has hitherto se as a complete protection. Any substance, haps, would answer equally as well as gravel, such a nature as not to invite and afford wi quarters to the little mischievous pests.

PRUNING PEACH TREES.

One remark will be offered as to the mod pruning. This ought to be effected by hear down, that is cut off all the top, to within 5 feet of the ground once in 4 years at least; no jury will result, but more healthy and vigo wood will be formed and a greater quantity fruit be produced; as peach trees seldom more than 1 or 2 years in succession, the succ ing spring after a bearing year should be sele to perform the operation. Young wood will t be produced and if the season be favorable, y a good supply of fruit the next year, as the set year's growth is that which mostly, if not alw produces fruit in the peach tree. The evils contrary course of pruning consist in the li towards the bottom of the tree becoming si and dving; the top running up so high as to exposed to the wind and consequently being b

ience, not theory, that has dictated the above stances, to them, the most odious and detestable. marks. Yours respectfully, Newton, Merch 1, 1831. SETH DAVIS.

ON, H. A.S. DEARBORN.

President of the Mass, Hort. Society. DEAR SIR-If you deem the following remarks on canker-worm worthy of trial, they are at your sere. The circumstance, that we know not the cankerrm here, may be my apology for not being able to ke any experiments on this subject of myself.

Very respectfully,

Your friend and most obedient servant. Vewton, March, 4, 1831. WILLIAM KENRICK.

REMARKS ON THE CANKER-WORM.

In the immediate vicinity of my residence Theve the canker worm has never yet appeared; ram I aware that I have ever seen this insect: I have but too often been a witness of its raves in the distance :-- whole orchards resembling ests through which the destructive flames have

Under these circumstances I trust it may not be med presumptions in me to attempt writing on ubject on which so much has already been said I written, and yet on which so much still reins to be done.

Among the various remedies which have been ps of list which are to be nailed round the tree, ve led us to doubt as to its certain efficacy.

Other ingenious modes have been proposed, as gular frames of lead or of wood, in which are med circular gutters, for the reception of oil, &c: se are to be nicely adjusted both to the tree and a perfect level; I have no doubt these modes ght answer; yet how far their efficacy has en tried or approved on an extensive scale, we not yet informed.

Another writer has proposed carting away the containing the grab in autumn to the depth tree to the extent of the circumference of its inches; carrying this infested soil to the barn d or to a distance, and replacing this by anier and better soil.

But of all the remedies hitherto extensively opted, tarring seems to be the most certain and apoved.

The objections to this are, that it injures the tree; t to obviate this, strips of canvas are someies first nailed around the tree : it requires unpridge of carcases over the tar, and in one fahour the whole swarm have ascended; and en this event takes place, I believe nothing

affording a less quantity of fruit and that of sage of the insect in its natural, and more or less inferior quality. No better time for pruning direct ascent. What I now propose, therefore, is ich trees perhaps can be selected than about to oppose to the progress of the canker worm an 1st of June. The mode and time of pruning obstacle, which they can in no wise pass, without y appear to those who have never made the being first compelled to an indirect course, and unempt at variance with their ideas; but it is ex- natural descent; and this too over the very sub-

> First, a compound belt is to be formed around the tree, projecting an inch and a half, or an inch and three quarters, from the body of the tree. This belt may be very readily formed by bending around the tree double or triple bands, consisting of as many small sticks of green alders, osiers, or other pliable wood; each reduced by shaving on two sides only, to the proper thickness, and secured to each other and to the tree by nails.

Around the belt thus formed, a thin strip about two and a half inches in width is bent and nailed. to it by its upper edge, and projecting below the belt previously formed, about two inches; and every crevice above is now to be carefully closed with clay.

This strip may consist either of the thin lead procured from the lining of tea chests, or of paste- | ject will oblige a board previously oiled with linseed-oil and dried, or of thin oak or ash basket stuff. It is to the inside of this outward strip or helt, and very near its lower edge, defended alike from the sun and rain. that the tar, mercurial ointment, or other offensive substance is to be applied, and occasionally whenever necessary, renewed.

Let me here suggest another substance perhaps deserving of trial, and one to which I think all insects have a mortal aversion. It is the bark of elder, which may be prepared by simmering in scribed for this purpose, it has been confidently lard; after straining, the substance may be aperted that the mercurial ointment, any lied to plied in the manner of the mercurial ointment.

When the season of the canber worm is over, in effectual remedy; yet your own experiments, the belt may be removed from the tree, and preserved till another season, to be again reapplied and refitted to the same or other trees.

BEES.

MR EDITOR-Seeing in your last paper a communication from Mr E. Beard requesting information as to the probable cause of bees producing so great a heat as he represents in his communication and how they have the power of creating it. I have ventured to give my opinion as to the cause of this phenomenon, although I make no pretension as a naturalist, and am much younger than as many inches as may be necessary; and from Mr Beard in the management of bees, it being only about three years since I commenced keeping them. It is a fact well know to naturalists, that whenever bees become agitated from any cause whatever, the animal heat is greatly increased to such a degree that they are compelled to leave the inside of the hive.

I consider the heat increased in proportion to the population of the hive and the commotion of the bees. I have no idea that bees keep up a uniform temperature in the hive, although 1 presume asing watching and attention for many weeks: an extreme degree of heat makes it very uncomstarring must be very frequently renewed, for fortable, and extreme cold produces torpor. Now, nen dried on its surface, it no longer serves as a Sir, you will remember that Mr Beard says the rrier to the progress of the insect: yet even bees were fastened up one day before this event aile fresh, the insects will not unfrequently form bappened. My opinion is, the bees being fastened up, they were deprived of the usual supply of fresh air; they became uneasy and tumultuous, of course increased the animal heat; being prevented from ore is to be done; the business is ever, and the leaving the inside of the hive or of obtaining fresh es must be abandoned for that season. Hitherto air, they became, perhaps, more agitated, and I ly been made with a view to obstruct the pas- as he has represented.

I think as a general idea it is not a good plan to fasten up bees in their hive, especially when there is a great population. It has a tendency to engender diseases. I prefer a room sufficiently tight to prevent the escape of the bees when there is snow upon the ground, or one of Doctor Thacher's improved bee houses. I have built me one of them; I find it answers a much better purpose in preventing bees from going out upon the snow, than it does in preventing the bee-moth-from-entering A SUBSCRIBER. my hive.

March 4, 1831.

MULBERRY TREES-QUERY.

MR EDITOR-Information is wanted through your paper, in regard to the best method of setting out a plat of mulberry trees, for the raising of silk. Is it the better way to plant them out in the manner of hedge fence? If so what distance should there be between the rows and what distance from one plant to another? If some other plan is better, what is it? Answers to these questions and any information upon the sub-SUBSCRIBER.

Methuen, March 8, 1831.

WHITE BEET, OR SWISS CHARD.

As there has been much said respecting this plant, the year past, we trust that a description of it will will be acceptable to many of our readers, The seeds of this plant have been distributed under several different names, as the great white beet, the Sinclair beet, the silver stalked, and the swiss chard. It is a biennial plant, the leaf-stalks of which are very large, and of silvery whiteness, and are the most valuable part of the plant; the leaves are thick and succulent, and are also boiled as spinnage. "The roots of this plant are of but little worth, not being larger than a man's thumb. It has been cultivated in gardens on the continent, since the sixteenth century. It is found growing wild on the sea coast of Spain. It is equally as hardy as other kinds of beets, and is sowed early. The stalks will be fit for use in August, and should be boiled and dressed as Asparagus.

As there has been considerable demand for the seed of this kind of beet, for one or two years past, it has been difficult to procure it free from admixture with the seed of other varieties; it may be well, therefore, for those who intend raising, to plant thick, and allow the plants to remain until they are about four or five inches high, when they may be thinned, as at this time the genuine ones may be distinguished by the white stalks and veins of the leaves. Others should be rejected.

Having raised this plant we can recommend it to others as worth cultivating .- Genesee Farmer,

Cure for the Scab on Sheep .- Cnt off the wool as far as the skin feels hard to the fingers; then wash the scab with soap suds, and rub it hard with a short brush so as to cleanse and break it: make a decoction of tobacco, to which add one third by measure of ley, a small quantity of hog's lard, or as much as the ley will dissolve; then add one eighth of the whole in measure of spirits of turpentine. This liquor is to be rubbed upon the part infected three times with an interval of three days between each washing. In this simple way a thorough cure will be effected, and the inhuman treatment of our scabby quacks be prevented. If the disease be taken in season, it may be cured erefore, I will suppose, that the attempts have think increased the heat so as to melt the comb by rubbing spirits of turpentine and hog's fat on the place infected .- Hamp. Gazetle,

REPORTS

OF THE

ESSEX AGRICULTURAL SOCIETY IN 1830

Continued from page 269.

ERASTUS WARE'S STATEMENT.

To the Committee of the Essex Agricultural Society on Farms. GENTLEMEN-The farm known by the name of the Pickman farm, of which the subscriber is at present, and has been tenant for nearly eleven years, is situated in the southeasterly part of Salem, and contains four hundred and twentyeight acres of pasturage, tillage, and mowing. The pasturage includes about three hundred acres much broken, of every description from wet pond holes to barren rocks. No attempts have been made to improve this pasture other than clearing the bushes and draining some low parts, as there is no prospect of a remuneration for such labor. The amount of land under tillage, the present year, has been about twentyone acres, and the amount of upland or English mowing, is sixtythree acres. Of the tillage and mowing lands, a considerable part consists of thin gravelly soil, of better than a medium quality, and favorable to most grain crops; and another part consists of a clavey soil, resting on a clay pan, retentive of moisture and yielding good crops of grass and potatoes under liberal manuring and cultivation, The farm is well watered. Much of the mowing and tillage, in the spring of the year, would naturally be overflowed; so that much labor has been necessary to prepare and lay it down to grass in beds, that the water may be carried off in drains.

Some of the most productive grass land on the place has been in this way reclaimed from an unprofitable marsh or swamp, and made to yield very large crops of English grass. We have no land on the place which is irrigated by any artificial process. There is of wet meadow land not more than five acres, which is never tilled, but drained and yields good stock hay. We have of salt marsh thirtynine acres, generally yielding good crops of black grass. This is ditched, from which well known advantages arise; but no other labor is expended, other than taking the crop. Of the cultivated land the present year,-

Five and a half acres were sown with Barley,-About seven acres were sown with Indian corn, Four and three fourths acres with Potatoes,

One acre with Mangel Wurtzel,-

One third of an acre with Onions,-And one half of an acre with crook-necked

winter Squashes. Small parcels were cultivated with garden veg-

etables for the family, and supply for the retail market, the produce of which I cannot conveniently account for

Many of the mangel wurtzel plants were destroyed by worms, and their places supplied by rata baga,

The manure used on the place, has been principally made by the stock kept on it. I have carted into my barn yard bog mud, damaged hay, and obtained from the neighboring beaches, sea wreck and eel-grass, which I put in my hog styes, -Kelp, rock weed, &c. which I put directly on the grass land. For small grain crops no manure is applied by me, on the year of their being sown, unless the land is very wet and cold,

My Barley was raised on ground, on which the preceding year I had a very good crop of

manure spread and ploughed under the sward, and supply for retail in the market, since the fi My Indian corn this year, contrary to my usual of August with some fruit which has been tak practice, was raised on land which was planted while growing and ripening, so that I cannot gi the preceding year with Indian corn-spreading an accurate account of the amount. and ploughing under coarse mannre both years. But the sward being so completely bound with the crops of corn; shook from the trees, ni twitchgrass I could not subdue it in one year. I have hundred bushels of unripe apples, which we found a crop which shades the ground most per- partly manufactured to very little advantage in feetly is the most effectual in destroying the twitch-cider, and lessened much the expected profits grass-and this was an inducement to plant corn the orchard. a second time, in drill rows, and I have thereby effected my object in destroying that pernicious fruit are of nearly correct measurement; # root. My corn was raised on a gravelly soil, as amount of hay is given by as accurate an es before described. In the former part of the mate, in each load, as could be made by an exp season it appeared small, but it afterwards grew rienced and disinterested individual. with great promise until a severe gale in August blew it down, so that it was necessary to cut it up herds-grass and red-top, with some clover. The green, and shock it in the field till it was dry. The amount of seed used in laying down land crop was much injured, but I was satisfied that grass is a peck and half of berds-grass and three cutting it up green was my best way,

ders of some of the fields, were raised on ground not be sowed to advantage in rich moist lan newly broken up, and the manure, at the rate of When I sow grass seed in the spring I sow bark eight or nine cords per acre, taken from the barn with the grass seed. I have been very successfi yard, composed of litter and the deposits of the in laying down land to grass in the fall, after tal cattle, was spread and ploughed under the sod, ing a crop of poratoes, in which case nothing by The soil, on which the potatoes grew, was moist grass seed is sown, and clavey. The potatoes were ploughed, and hoed twice, and harrowed once between the rows, -the seed, of the Chenango kind, of excellent and many with very choice fruit) mostly youn anality.

The corn was hoed three times, but not hilled as has been customary; and upon a comparison of that not hilled, with a small piece, which was in some degree hilled, after a severe gale, I am satisfied that no advantage is gained by hilling as was formerly practised. My opinion is that there is no benefit derived by hilling corn,-and corn raised on a flat surface, when the weeds are destroyed and the ground kept loose, is by no means so likely to suffer by the drought, or to have its roots impeded in the search after their proper nutriment, as where the ground is drawn main, Nonpercil. For elegant and delightful ear up round the stalk in a high and steep hill,

The manure applied to my other crops was of the best kind I could procure, and applied nearly as can be ascertained at the rate of about ten cords to the acre: for crops of potatoes and Indian corn, my experience leads me to apply my manure spread green and fresh, believing that by der this one of our most probable apples for cultiso doing its strength is best preserved and much vation. The Mammoth Pippin is valuable for its labor saved.

For smaller crops, and tap rooted plants, I prefer manure that is fine and well rotted.

The amount of crops raised this season on the farm is as follows-

l'Potatoes,	1220	bushels.
Mangel Wurtzel,	600	4
Ruca Baga,	50	6
English flat turnips,	850	6

The hay on the farm is generally a mixture pecks of red-top to an acre. There is usual My potatoes, except a few raised on the bor-enough of clover seed in the manure, and it ca

> The number of bearing trees on the farm as follows :- Of Apple trees (almost all engrafte 763-Pear trees, 65-Cherry trees cultivated, 50 In addition, I have a nursery containing 300 trees-most of which have been engrafied or but ded. Of the apple-trees, some of them are in or chards, of which the ground about the roots is cu tivated, and occasionally manufed, when the cor dution of the tree requires it; others are plante by stone walls; and all of them are annually orus ed. In the choice of kinds of apples, regar should be had to the use they are wanted for. I for the market or your own table, I would recom mend the Ribstone Pippin, Spitzenberg, Spice Pear ly winter apples, in enting in October and No. vember, the Pickman Pippin (a name that we have adopted not being able to trace its origin be youd this farm) will compare well with any other apple within my knowledge. The trees are of 1 thritiv growth, and handsome form. We consisuperior size only,

There are two Bacus on the place, one 100 feet in length and 35 feet in breadth, the other recendy built, 114 fect in length and 42 in width. In the laster the mileh cows are commonly kept. It has a cellar under the whole, the main part of which is for manure and receives all the deposits of the cattle. - A portion of this cellar is enclosed for the storing of fruit and vegetables .- The barn has a floor through the whole length. The cattle are principally placed on one side, and the hay comes to the floor on the other. The centre over the floor from scaffold height is at last filled to the ridge. The barns are not large enough for storing all the hay, and considerable quantities are necessarily kept in stacks out of doors.

The live stock kept on the place are as follows: -Ozen, 6-Cows, 50-Heiters, 5-Bull 1-Horses, 3-Fatting swine, 9-The weight of pork fatted is not yet ascertained, as the home have not been killed-but the average weight of Cheuango potatocs, which I manured with coarse abundant supply, and we have had an assortment my swine, last year, was about 300 lbs. eachand this year, the result will probably be about

of milk for the market in Salem, where it is sent ituation be raised to advantage.

The amount paid for labor the past year ha een eight hundred foctythree dollars, thirtyseven ents. From which is to be deducted for extrather in building stone wall, and for men and am employed off the farm for the town, &c, two undred and sixty dollars - leaving the net amount f cost of labor upon the farm, fire hundred eightyree dollars, thirty seven cents. My own labor ad the labor bired in the house, is not included the above estimate.

The laborers on the farm are freely supplied ith family beer, molasses and water, milk and ater. Cider is not preferred in warm weather, cept with food. No ardent spirit is used on e farm except for medical purposes, and for at probably not to exceed one gallon in a year.

have endeavored to give as correct and full a atement as is in my power. I have ever been ed to agriculture from my youth; but have had other advadtages than those derived from actual perience. So far as my opinion on the subject ay be deemed of any importance, it is in favor of alternation of crops on the same land, and an casional change of every kind of seed.

All of which is respectfully submitted, ERASTUS WARE.

Salem, Dec. S, 1830.

IMPORTANCE OF AGRICULTURE.

The life of republicanism is committed to the ners and cultivators of the soil. If they include epensive habits, involve the r interests, eat and var out their farms, they are not the Farmers to som the Genius of Liberty looks to the perpetty of our civil institutions; her trust is in those o live like farmers, increase in substance, petuate in their amilies their own babits, and keep we and independent of the men of the learned ofessions. By and by we shall have professorps of agriculture in our chief literary instituis, making farming a science in fact, as it now only in name, and then, but not then, will shandry be duly honored as a business, honored all men, ministering to the wants of all. That n, whoever he may be, who first unites the cuies of art and science, practical with scientific nds a school of scientific agriculture and eximental farming, for the education of the th of this republic, will perform a service of re importance to his country, to pure religion, I to his God, than the founder of a hundred nools of Theology.'-Stafford's Gazetteer of New rk-p. 564.

twice a day in summer, once in winter -- a distance Kynaur, Esq. F. R. S. President of the Horticul-something more than that of having worn away of about two miles. The number of gallons semi-tural Society, &c. giving a description of an imple- a minute position of the metal; but I am not dispresent month, is 13,870—Butter made in the same a consists of a cylindrical bar of cut sucel, three effects which I may have conceived it to produce. time, 550 lbs.-Cheese (called four meal cheese) inches long without its handle, and about one 600 lbs. Of Calves, in the same time, have been third of an inch in diameter. It is rendered as eccived for those factored and sold, 151 dollars; smooth as it can readily be made with sand, or more be others have been killed as soon as the milk of properly glass paper, applied longitudinally; and he cow was fit for use; their skins sold for 50 it is then made perfectly hard. Before it is used it zents each, and the carcass boiled and given to must be well cleaned but not brightly polished. he hogs.—The cows are all of native breed, and and its surface must be smeared over with a mixare generally bought when young from the course of oil, and the charcoal of wheat straw, which ry; as stock of this description cannot in my necessarily contains much silicious earth in a very finely reduced state. I have sometimes used the charcoal of the leaves of the Elymus arenarius (a species of rush-grass) and other marsh grasses; and some of these may probably afford a more active and (for some purposes) a better material; but on this point I do not feel myself authorized to speak with decision.

'In setting a razor, it is my practice to bring its edge (which must not have been previously rounded by the operation of a strap; into contact with the surface of the bar, at a greater or less, but always at a very acute angle, by raising the back of the razor more or less, proportionate to the strength 1 wish to give the edge; and I move the razor in a succession of small circles from heel to point, and back again without any more pressure than the weight of the blade gives, till my object is attained. If the razor has been properly ground and prepared, a very fine edge will be given in a few seconds; and it may be renewed again, during a very long period, wholly by the same means. 1 have had the same razor by way of experiment in constant use during more than two years and a half; and no visible portion of its metal has within that period been worn away, though the edge has remained as fine as I conceive possible; and I have never at one time spent a quarter of a minute in setting it. The excessive smoothness of the edge of razors thus set, led me to fear that it would be indolent comparatively with the serrated edge of razors thus given by the strop; but this has not in any degree occurred, and therefore I conceive it to be of a kind admirably, adapted for surgical purposes, particularly as any requisite degree of strength may be given with great precision. Before using a razor after it has been set, I simply clean it on the palm of my hand, and warm it by dipping it into warm water, but I think the instrument recommended operates, best when the temperature of the blade has been previously raised by the aid of warm water,

'A steel bar of the cylindrical form above described, is, I think, much superior to that of a plane surface for giving a fine edge to a razor, or penknife; but it is ill calculated to give a fine point to a lancet; and I therefore cause a plane surface to be made, a quarter of an inch wide, on one side of the bar, by cutting away a part of its subriculture, field-farming with book-farming, and stance, and I have found this form to be extensively

> 'The edge of some razors, whether formed of wootz, of mixed metals or of pure steel, but particularly of mixed metals, has generally appeared to me, to be more keen and active, when used a few seconds after it had been applied to the bar, than on the following day; and I have often seen for Stock in the Susquehanna Rail Road Company.

On the means of giving a fine edge to razors, lances, the manost activity restored to the edge of such and other cutting instruments.—The Journal of the instruments so instantaneously, and by such in ad-The chief object of the farm is the supplying Royal Institution of Great Brusin, for Oct. 1830, equate means, that I have been sometimes led to contains an article from the pen of Thomas A, suspect the operation of the bar to have been to marker, during the year ending the first of the ment for the purpose above mentioned, which posed to offer any conjectures respecting other

> AGRICULTURAL SOCIETY .- The annual meeting of the Hampshire, Hampden and Franklin Agritural Society was held at the American Hotel, last Wednesday. The following officers and committees were chosen :---

Hon. MARK DOOLITTLE, President.

Messrs Samuel Wells, of Greenfield, Patrick Boies of Granville, Joseph Carew, of Springfield, Theodore Lyman of Amberst, and Joseph G. Cogswell of Northampton, Vice Presidents.

Messrs Daniel Stebbins, Rec. and Cor. Secretary; Samuel Wells, Jr. Treasurer,

COMMITTEES .- Messrs R. Hubbard of Northampton, E. Edwards of Southampton, and P. Bartlet of Northampton, on . Igriculture -1. C. Bates, J. G. Cogswell of Northampton, and Dennis Stebblns of Deerfield, on Inimals -O, Baker of Amherst. E. Williams and Stephen Brewer, of Northampton, Domestic manufactures -S. Stoddard, J. D. Whitney, and D. Stebbins of Northampton, Auditors.

After the election of officers, the Committee on Premium Cider, made the following Report : Mr Eben, Clark of Conway, is entitled to the first premium; Mr S. Clark, of Conway, the 2d; Mr E. Clark of Conway, the third, and Mr Elisha Edwards, of Southampton, the fourth.

(F We learn the Society are desirous of offering more liberal premiums for the encouragement of Agriculture, the growing of the best and most useful breed of horses, and other animals, and that for this purpose they will soon issue Circulars to obtain additional Funds. The Constitution and Bye-laws are now so amended and altered, as to admit of the Cattle Show and Fair to be holden at such time and place, within the limits of the Society, as, in the opinion of the Executive committee, may best promote its interests and the public good .- Northampton Courier.

MAPLE SUGAR .- In the little town of Wilmington, Ver. no less than 33,000 pounds of Sugar have been manufactured in one year, and a town in the Northern part of the State, the name we do not recollect, has manufactured 42,000 pounds. Even in this town, many of our farmers manufacture large quantities .- In Westmoreland many farmers produce half a ton .- One farmer in Cilsum has made 2200 lbs. In Maine, we have no doubt the whole State might be supplied-so in Vermont. Maple Sugar when refined, is said to be superior to the best refined from the West Indies .- Keene Sent.

The bill incorporating the Schenectady and Saratoga rail-road company which had passed the Assembly, was passed on its final reading in the Senate last Saturday .- .. Ilbany paper,

The receipts of the first nine weeks on the railway from Liverpool to Manchester, for passengers alone, exceeded \$5,000 dollars.

The Maryland Legislature have voted \$100,000

MEW ENGLAND PARMER.

BOSTON, WEDNESDAY EVENING, MARCH 16, 1831.

POULTRY.

Continued from page 254.

Every succeeding year after the third the hen continues to shed her feathers later in the season and to lay few or no eggs during the moulting period, which is sometimes protracted to two or three months. Old bensure seldom to be depended on for eggs in the winter; and in general it is most profitable to dispose of hens while they are yet catable or salcable for that purpose, which is in the spring of the third year.

In some hens the desire of incubation is so powerful that they will repeat it five or six times in the year; in others it is so slight that they will not sit more than once or twice in the season. A skilful breeder will take advantage of these qualities, and provide abundance of eggs from the one variety, and of chickens by means of the other, Hens, while sitting drink more than usual, and it is an advisable practice to place water constantly befor them when in this state, and food (say corn or Indian meal dough) at least twice a day,

Hatching .- The chicken hitherto rolled up like a ball, with its bill under the right wing like a bird asleep begins generally on the morning of the twentysecond day to break its way through the shell, neither the aid of the hen, nor the art of man.in common cases is necessary to aid it in this interesting and wonderful operation. The parental affection of the hen, as Mowbray and Parmentier have observed, is always intensely increased, when she first hears the voice of the chicks through the shells, and the strokes of their little bills against them. The signs of their need of assistance, the former author observes, are, the egg being partly pecked, and the effort of the chicken discontinued for five or six hours. The shell may then be broken cantiously, and the body of the chicken carefully separated from the viscous fluid, which lines it.

Reaumur gives his opinion that no aid ought to be given to any chickens but those which have been near twentyfour hours employed without getting forward in their work.

The chickens first hutched should be taken from the hen, lest she be tempted to leave her task unfinished. Those removed may be secured in a basket of wool or soft hay, and kept in a moderate heat if the weather be cold, near the fire. They will require no food for many hours, even four and twenty, should it be necessary to keen them so long from the hen. The whole brood being hatched, the hen is to be placed under a coop abroad in a dry spot, and if possible not within reach of another hen which has chickens, since the chickens will mix, and the hens are ant to main or destroy those which do not belong to them. Nor should they be placed near numbers of young fowls, which are likely to crush young chickens under their feet, being always eager for the chickens' meat. Eggs boiled hard or curds chopped fine are recommended. Indian meal made into dough is a common and I believe not improper food for chickens. Loudon says that all watery food, soaked bread or potatoes is improper for very young chickens. Their water should be pure and often renewed, and there are convenient pans made in such forms that the chickens may drink without getting into the water. There is generally no necessity for cooping the brood beyond two or three days, but they may be less. Buffon says that a ben well fed and attended cash,

confined as occasion requires, or suffered to range, as they are much benefited by the foraging of the hen. They must not be let out too early in the morning, or while the dew remains upon the ground, nor be suffered to range over the wet grass, one common and fatal cause of disease. It is also necessary to guard them against unfavorable changes of weather, more particularly if attended with rain, as nearly all the disorders of daughill fowls arise from cold moisture,

For the period of the chickens quiting the hen, there is no general rule, except when the hen begins to roost, leaving her offspring to shift for themselves. If sufficiently forward they will follow her, if otherwise they should be secured in a proper place, and permitted to run with the young poultry as nearly of their own age and size as possible, since the larger are apt to overrun and drive from their food the younger brood.

Hatching chickens by artificial heat has been practised in some countries, and some of the requisites in the process are stated in the Encyclopedia of Agriculture; but it is not perhaps advisable to attempt it in this country with a view to

Eggs will retain their moisture and goodness three or four months or more if the pores of the shell be closed and rendered impervious to air by some oily or greasy application. London says we generally anoint them with mutton suct melted, and set them on end, wedged close together in bran, strutum super strutum, fone layer above another the containing box being closely covered. Laid on the side, the yolk will adhere to the shell, They thus come into use at the end of a considerable period of time, in a state almost equal to newlaid eggs, for consumption, but ought not to be trusted for incubation, excepting in the case of imported eggs of rare birds.

Other methods which have been recommended for preserving eggs are as follows:

Apply with a brush a solution of guni-arabic to the shells, or immerse the egg therein, let them dry, and afterwards pack them in dry charcoal dust. This prevents their being affected by any alteration of temperature, and the power of charcoal as a preservative against putrescence is well known. Or mix together in a tub or vessel, one bushel of quick lime, thirtytwo ounces of salt, eight ounces of cream of tartar with as much water as will reduce the composition to a sufficient consistence to float an egg. Then put and keep the eggs therein, which it is said will preserve them perfectly sound for two years at least. Eggs may also be preserved in lime water, or lime and water mixed to about the consistence of white wash; but the lime is apt to corrode the shells, so that they become very thin and tender, and are semetimes quite worn away. The largest eggs 'according to London' will weigh two onnees and an half, those of the Chitagony hen perhaps three onnees. To promote feeundity and great laying in the heu, nothing more is necessary than the best corn (grain) and fair water; malted or sprouted barley has occasionally a good effect. while the hens are kept on solid corn, but if continued to long they are not too scour. It must be noted that nothing is more necessary towards success in the particular of obtaining plenty of eggs than a good attendance of cocks, especially in the cold season; and it is also especially to be observed that a cock while moulting is generally use-

will produce upwards of one hundred and fifty eggs in a year, besides two broads of chickens. Hens, it is said, should have access, especially in winter to slacked lime, or oyster shells, otherwise they will produce few or no eggs as something of a calcareous nature is necessary to afford the fime which constitutes the greater part of the egg shells. Wheat however contains phosphate of lime, and if given to hens is said to supply the material indispensable for the formation of egg To be continued.

From the Evening Gazette.

NATURAL SCENERY.

MR CLAPP - It is greatly to be regretted that in the present enlightened age of Horticulture, so little attention is bestowed on that interesting dopartment of 'Nutive Scenery,' of which so many improvements may be made by transplanting the various forest trees and shrubs indigenous in this country-there being hundreds of acres of land in this vicinity merely in a state of barrenness, which by being covered with trees and shrubs would enliven the scenery and add to natural grandeur. The much admired Liviodendron tulipifera or saddle leaf tulip tree; the Catalna, or trumpe tlower; and the European Lime and Horse Chesnut trees appear to invite the attention of the man of taste; while the different varieties of Oaks might be introduced into the vacancies and outlets of copses, and thereby improve the value of the soil. And why neglect the pretty Kalmias . Izilias, Rhododendrons, and their natural assem blage? Surely they are worthy of a place in shrub beries and parterres. The plants that are consi dered the very pride of European flower-garden ing are here allowed to waste their beauties in the desertair,' almost unnoticed. In the flowe garden department, many varieties of native plant may be introduced from the different parts of the States, especially the pretty genus of Phlox, Core ousis, Rudbeckius, of which so many varieties ar already discovered, and many more too numerous to name

If nature has imposed a perpetual indulgence to the admirers of taste it may be found in the 'Flora' of the universe;—the adaptation of these harbingers of pleasures appears to be universally suited in their natural element to all classes of people, as, the same symmetry of form-the same nice tints of nature's pencil-and the same useful qualities appear to the poorest peasant as the greatest monarch! in distinct varieties, with at exception of cultivation; or rather an act of violence imposed on nature to produce monstrosities. which are for a certain time the very objects of dispute among connoisseurs, and then return to their primitive purity to be common to all; in this state they are the most perfect, and in consequence may be considered the most pleasing. We also find that, most generally, the parts of generation are continued in all countries and are perpetual, by which nature appears to ordain the indulgence of flowers to all nations or people,

The Lafayette Land .- Mr Skinner of Baltimore has received unqualified authority from General Lafayette to dispose of one half of the township granted to him by Congress. The tract consists of 24,000 acres and much of it is well suited to the growth of cotton, tobacco and sugar cane. Mr Skinner proposes to sell the land in alternate sections on long credits to practical settlers, as far as may be, demanding on a small portion of the price in 20,000 White Mulberry Trees.

Orders received by the subscubers for the above Trees, to be delivered in the monta of April: they are from one to three years old, of the first quality, and will be sold on GREGG & HOLLIS, reasonable terms. -Dealers in Medicine, Paints, Oil, Window Glass, &c.-

No. 30 Union street, Boston. 11 March 16.

Sills - Sills.

The Subscriber, of Jathey, Cheshire county, New Hampshire, has two or three thousand White Mulberry Trees of three years' growth, in the order for transplanting the present Spring, which he will dispose of on reaterms. Inquire of ISANC PARKER, 71 Water street, Boston, or the subscriber. ASA PARKER.

Jaffrey, March 15, 1831

Grape Fines,

The sub-criber offers for safe at his garden at Dorchester, a few Cuttings of the black and white 'Moscatel' Grape Vines, just received from Cadiz, procured for him by the Consul of the United States, resident there. He says, 'I obtained these cuttings from Vines on which I have seen clust is of Grapes weighing as much as TWEN-They contain several joints and will TYSIX POUNDS. be sold at 50 cents each.

250 Isabellas, 2 years old;

l yr

300 White Muscaline ;

Napoleon, Gore's, a beautiful black fruit;

8 Varieties of superior fruit from Xeres and Malaga; Some large Vines from France, that have borne fruit two seasons, very prolific and of fine quality; 150 CATAWBAS;

100 Bland's :- and several other kinds.

Orders by until addressed to the subscriber, or personal pplication at his office, 75 Congress street, for any numer of Vines, from one to one hundred, will meet with ZEBEDEE COOK, Jr. compt attention. March 12, 1831. 5t

Farmer Wanted.

A man with his wife is wanted to manage a Farm of bout 50 acres, in Rhode Island. He mu t be well acuainted with his business, have a practical knowledge f farming, as it is now comied on in Massachuseits. To neat, industrious, capable and economical man, liberal neouragement will be given. He shall be entitled to he whole produce of the Farm the first year, provided ie stays a number of years, which may be agreed on, not ess than five. Apply (post paid), to J. B. RUSSELL, Vew England Farmer office, Boston. 4t March 16.

European Leeches.

The subscriber has made such arrangements abroad, as a enable him to be constantly supplied with the genuine nedical Leech. All oclars will receive prompt atten-ion. EBENIZER WIGHT, Apothecary, 6 Milk street, opposite Federal st. coptt March 16.

Farm for Sale.

A fine opportunity to any person wishing to make improvements in farming is presented, by the offer for sale. f one of the best Farms for this purpose in the State; sitrated 9 miles from this city. A large part of the land is Huvial soil, may be easily kept drained, and made exeedingly productive. A further description may be seen t this office. March 16.

Seeds for Country Dealers.

Traders in the country who may wish to keep an assortnent of Garden Seeds for sale, are informed they can be urnished, at J. B. Russell's Seed Store, connected with the New England Farmer, 52 North Market Street, Boston, with boxes of various sizes and prices, from 10 to \$50, containing a COMPLETE ASSORTMENT of the seeds nostly used in a kitchen garden, on as favorable terms as hey can be procured in this country, of equal quality, reatly done up in small packages, ready for retailing, with thort directions on each package for its culture and nanagement—warranted to be of the growth of 1830, and of the purest quality. Nov. 5.

Cow Cabbage.

Just received, at the Seed Store, No. 52 North Market street, from London a small quantity of Seed of the Cow Cabbage; it is thought that no plant cultivated in this country will give so much fodder from the same space of ground, for Milch Cows, as this, It has been successfully cultivated to a large extent in New England and the Midtle States the past year, and promises to be a great acqui-

AARON TALER, of Bath, Maine, having commenced an Establishment for the Promotion of Agriculture and Domestic Economy, and having made arrangements with Mr. J. R. Newell, and Mr. J. B. Russell, of the Agricultural Warehouse, Boston, for a supply of the most Inproved Tools and Seeds, recommended by them as valuable and useful to be introduced-will be enabled to supply the farmers in Mame at the Bosten prices, with the addition of freight. Persons on the Kermeber, and vicinity, will find it to their interest to call at Mr TYLER's establishment for their supply of farming Tools and Gar-

A Tyler also tenders his services to the horticulturists and mirsery men of Missachusetts indelsewhere, for the sale of all kinds of Trees, Vines, Plints, &e, and will be at all times ready to fill orders for the best of Forest Trees, from Maine, put up and packed properly and shipped according to order.

A. T. flatters himself by close application and assidnous attention to the above objects, that he shall be enabled to give satisfaction to the public, and be a means of introducing into Maine many valuable productions, heretofore unknown, and thereby be a source of improvement to the agriculturist, and of gratification to himself.

A. T. also tenders his services for the sale of Improved

Breeds of t'attle and Sheep.
WANTED, a full blooded Bull, 3 or 4 years old, con-

taining the best breeds for Milk and Oxen. Letters (post paid) will receive prompt attention.

Red Dutch do (for pick ling) Early Dutch Cauliflower Early Horn Carrot (very fine)

Long Orange Carrot White Solid Celery Curled Cress or Peppergrass

Early Cocumber. Long Creen Turkey do.

At this Seed Store can be found the greatest variety of Field, Grass, Garden, Herb and Flower Seeds, to be found in New England, of the very first quality, and at fair prices, wholesale and retail,

Also, Fruit and Forest Trees, Grape Vines, (of both native and European origin,) and Ornamental Shrubs at March 2. Nurserymen's prices.

White Mulberry Seed.

For sale at the Seed Store connected with the New England Farmer, 52 North Market street-

A small quantity of tresh White Mulberry Seed of the growth of 1830. Gentlemen in want of this Seed that can be depended upon, are advised to apply soon, as the supply here, and throughout the country, is uncommonly small .- Short directions for its culture furnished gratis with the seed. Feb. 23.

Spring Rye.

Wanted immediately a few bushels of genuine Spring Rye, plump, for sowing-for which a liberal price will be paid at J. B. Russell's Seed Store, 52 North Market st.

White Mulberry Trees,

One and two years old; also Apple Trees, Strawberry and Grape Vines, for sale. Inquire of BENJAMIN BUR-BANK, Jr, near the meeting housein Bradford, East Par-East B. adfard, March 8. ish. Mass. 11

Farm Wanted,

(Within 10 miles of Boston,) consisting of 20 to 30 acres of first rate land, having a comfortable house, barn, &c. A line, stating particulars, addressed to H. L. T. box 556 3t Post Office, will receive attention.

Boston, March 9.

Early Polatoes,

For sale by Samuel Pond, near the Universalist Meeting House, Cambridgeport, a few bushels of his prime, carly Potatoes, which took the premium at the Massachusetts Horticultural Society's Shows last season; and are considered the earliest variety in this vicinity.

Also, a fine nulch COW, with her calf; a superior aninial as a milker, and perfectly gentle. Feb. 23.

Twentyfive acres of excellent Land, a House, and Chaise house, in Royhury—one mile from Boston line. Apply at J. B. Russell's See I Sore. 3t. March 2.

Furmer Hanted.

A single or married man is wanted to manage a farm in a very pleasant village about 15 miles from Boston. He must thoroughly understand his business; be acquainted with marketing, and produce the best recommendations as to his industry and filelity. Address J. B. Russell, Seedsman, Boston, (post paid). Feb. 23.

Treatise on Silk.

Just published, and for sale at J. B. Russell's Seed Store, 52 North Market Street,

A Practical Treatise on the Culture of the White Mutherry Tree and the raising of Silk. Price 123 cts .-\$9 per hundred—a valuable agricultural tract for distri-March 16. hutian.

Spring Wheat.

For sale at the Seed store connected with the New England Farmer, 52 North Market-street,

A few bushels of genuine GILMAN SPRING WHEAT: this sort is the most valuable one cultivated in New England, is very productive, seldom if ever attacked by blight, and is the kind which has for many successive years obtained the premium from the Massachusetts Agricultural Society. March 16.

NOTICE.

There will be a stated meeting of the Massachusetts Horticultural Society, at their Hall on Saturday next, at 10 o'clock A M.

TO READERS AND CORRESPONDENTS .- Six or seven communications are in type which will appear next week. The reader is requested to make the following corrections in Mr Phinney's communication, page 266, 1st column; line 14 from the top, for making read marking; line 12th from the bottom, for 'stable manure and,' &c, read stable manure or,' &cc.

BRIGHTON MARKET .- Monday, March 14. [Reported for the Chronicle and Patriot.]

At market this day 254 Beef Caltte, 16 pair working Oxen, 905 Sheep, 12 Cows and Calves, and 38 Swine .-We reported the Swine last week, and 320 Sheep were reported two or three weeks since.

Prices-Beef Cuttle-A further advance of 25c per hundred was effected this day. We shall quote from \$4 50 to 5 50, more extra Cattle were at market than usual-we noticed about 20 taken at \$6. We did not observe a single Ox which was sold for less than 4 50.

Working Oxen-Quite a number of sales. We noticed the price of only a few pairs at \$75, 70, 621, 55, Cows and Calves-Sales at \$24, 22, 17.

Sheep-Dull-no sales of consequence effected consequently we shall quote no prices.

Swine-Two small lots were s ld at 41c: none remain unsold.

PRICES OF COUNTRY PRODUCE.

The only principal alterations in prices since our last are as follows :-

APPLES, Red Baldwins, \$2 50 per bbl.

GRASS SEEDS have risen considerably-Timothy sells at \$2 50 a 2 75 per bushel. Northern Red Clover 124 a 13 cents per lb.

FLOUR has risen. Howard street sells at 7 25 to 750 -Genesec 7 25 to 7 50.

GRAIN. Northern Corn 73 to 75-Northern Rye 65 to 70. Oats 40 to 42.

MISCELLANY.

Culture of Silk .- We have seen several interesting and useful extracts from the Lectures of J. H. Colds, Esq. of Dedham, upon this subject, which is evidently and deservedly acquiring a firm hold of the public attention and regard in this country. The last afficle, which Mr Cobb has published, is a History of the Efforts in Silk Culture in North America. It was commenced in Virginia as early as 1623. It has now been commenced in almost every State in the Union. We give some sentences. which are all that our room will admit at this time.-Mass Jour.

In South Carolina, the ladies attended to this culture. Mrs Pinckney took with her to England a quantity of silk sufficient to make three complete dresses, one of which she presented to the princess dowager of Wales, one to Lord Chesterfield, the third was in possession of her daughter Mrs Horry, of Charleston, as late as 1809.

I was told by an intelligent citizen of the town of Hampton in Windham County, Con., during a visit to that county in 1825, that the culture was found profitable and was the best business that they could pursue. I found many families in some few towns nearly all engaged in raising silk; they make annually from five to ten, twenty and fifty and a hundred pounds in a season. It is probable that three or four tons are raised in that vicinity. The common estimate there, is that 4000 worms will yield a pound of silk, but from my own experience I am satisfied that a less number will yield that quantity, probably from 2000 to 4000.

From a communication of Gov. Lincoln to the Editor of the New England Farmer, I learn that considerable attention has been paid to the culture of silk, in the county of Worcester, and that the late Rev. Mr Holcomb, of Sterling, former minister of that place, spoke to him with great confidence of its profitable results. Silk has been raised in Dudley, Mass, for over thirty years; in the time of the last war the price was so high that more than usual efforts were made to cultivate it. The Rev. Jason Haven, of Dedham, obtained the premium offered by the selectmen of Boston, for molberry trees, and small quantities of silk have been raised in Dedham heretefore. I obtained from Rev. Dr Wood, of Boscawen, N. H. some eggs in the winter of 1825 and 6, and have raised some silk every season since.

PLATINA .- An interesting letter from ex-President Adams to a gentleman in Washington, on the subject of Platina coinage, has been published in the Intelligencer. Mr Adams states that the first suggestion of the use of this metal for coinage, was made in 1815, by the late ingenious Dr Erick Bollman, in a memoir addressed to the several European Powers, and that Dr B. caused at that time several impressions of medals to be struck in this metal, at the Mint of Paris, by a machine invented by him for the purpose.

Mr Adams thinks that plating would be useful in coinage, as holding an intermediate value between silver by the eye, but is immediately so on being held in the hand, its specific gravity being about double that of silver. A platina coin of the value of one dollar, would be of about the size of the Spanish eighth of a dollar. The appreciation of value which might arise from its being introduced into coinage, would, Mr A. thinks, be counteracted by the increased supply from the newly discovered mines in the Ural Mountains. Mass. Jour.

The amount of property left in pledge with twelve pawn-brokers in New York during the year ending January, 1831, was \$108,000. Among the articles pledged, were no less than 120,000 garments, and 16,000 sheets, blankets and counterpanes.

The Mint.—The	coinage	effected a	t the U.S
Mint in 1830, was as	follows:		
Half engles,	126,351	making	\$631,755
Quarter eagles,	4,540		11.350
Half dollars,	4,764,000	44	2,382,100
Dimes,	510,000	46	31,000
Half dimes,	1.240,000	44	62,000
Cents,	1,711,500	44	17,115

\$3,155,629 8.357,191 Of the gold coined, the amount of \$166,000 was from the gold regions of the United States. Of this fey, Potatoes and Flay; and on some lots, good Wheat amount, \$212,000 were received from Georgia, and Corn may be grown. To those wishing to obtain su-\$204,000 from North Carolina, \$26,000 from South Carolina, and \$24,000 from Virginia.

TRUTH,-If a man be sincerely wedded to truth, he must make up his mind to find her a portionless virgin; and he must take her for herself alone, The contract, too, must be to love, cherish, and obey her, not only unto death, but beyond it; Sales of all sines may be greatest advantage, the drovers for this is a union that must survive not only death, but time, the conqueror of death. The adorer of truth, therefore, is above all present thingsfirm in the midst of temptation, and frank in the midst of treachery, he will be attacked by those who have prejudices simply because he is without them; decried as a bad bargain by all who want to purchase, because he alone is not to be bought, and abused by all parties, because he is the advocate of none, like the dolphin which is always painted more vrooked than a ram's horn, although every naturalist knows that it is the straightest fish that swims,-Lacon.

WHAT IS LAW LIKE? -- Law is like a country dance, people are led up and down in it till they are fairly tired out. Law is like a book of surgery-there are a great many terrible cases in it. It is like physic too, they that take the least of it are best off. It is like a homely gentleman, very well to follow us. Law is like a new fashion, people are bewitched to get into it; fand like bad weather,' most people are glad to get out of it.

FOUNTAIN OF POWER .- The uncorrupted choice of a brave and free people, is the purest source and original fountain of all power .- George Washington.

Honey a Cure for the Gravel .- A number of years ago, says a correspondent, I was much afflicted with the gravel, and twice in serious danger, from small stones lodged in the passage. I mut with a gentleman who had been in my situation, and got rid of this disorder by sweetening his tea with balf honey and half sugar. I adopted this remedy and found it effectual. After being fully clear of my gold and silver. It is not easily distinguishable from disease about ten years, I declined taking honey and in about three months I had a violent fit of my old complaint. I then renewed my practice of taking hopey in my tea, and am now more than three score, and have not for the last twentyseven years, had the smallest symptoms of the gravel. I have recommended my prescription to many of my acquaintance, and have never known it to fail. MacLet Street. Political Exam.

> The experiments made in the South of Spain to cultivate the cochineal, have perfectly succeeded. la Murcia, the silk worm from China, which makes white silk has been introduced.

Fuluable and Cheep Land—for Sale.

The subscriber offers for sale, 14,000 acres of choice Land, masted in the town of Pinchney, county of Lewis and state of New Vork. Some of the land is in proved and under cultivation. The country is remarkably healday, many entirely need from the lever and ague and from the enoman bilious levers which often afflict the towns upon Lake Ontario, this town being 18 males east of the take. The soil is principally a sandy loam, much of it covered with rich tdack mould. The timber is chiefly Sugar Maple, Black Ash, Butternut, Beech, Elm, &c. The land yields first the e crops of Grass, Rye, Oats, Barperior grazing farms, a fine opportunity now offers itself. The produce of passurage and hay from an acre of this Land, is very large, tully equalling if not surpassing that from the same quantity of land in any other of the Black Biver townships. The land is admirably well watered, there being not less that which have not durable running streams up in them. The land is well adapted to Orcharding-the Apple uses thriving very well in this county. Sanck of all kinds may be disposed of with the least possipurchasing at the very doors of the farmers, and paying the highest each prices for their cattle, which will readily find purchasers at all seasons of the year. Several far-, mers at present resigner on this town, were originally from the New England States, and some of them from Massachusetts, who are in thriving circumstances. shove described land is offered for sale at the very low price or from two dollars and a half to three dollars per acre, for the uncleared land, and from three dollars and a half to five dollars and a half for the improved lots. The tape will be sold in lots to suit purchasers, and from two to five years' credit for payment in annual instalments, will be given. As a further convenience to purchasers, the subscriber will receive in payment, Cattle, Sheep, Perk, Grain or Grass Seed, for which products he will allow the highest cash prices. The title to the land is indisputable, and good Warranty Deeds will be given to purchasers. Persons desirons of purchasing will please to apply to the subscriber, at Henderson Hathor, county of Jefferson, State of New York, or to DAVID CANFIELD, Eso, on the town. JAMES B. HENDERSON. COMMUNICA TIONS.

FOR THE NEW ENGLAND FARMER.

ON THE CULTURE OF INDIAN CORN.

We all know that what is good husbandry for ne kind of soil, or one location, or for one farmer, s not, of course, for another.

n different soils, with a proper tillage for each. ocation, that is as to the value of the use of the and, the nearness to a market, and the facility with which manure can be procured, must be rearded.

A large forehanded farmer can often do to a .;antage, what would be ruinous to one differently Yet this should not deter us from rawing all the advantage we can from the expaence and observation of that class of farmers ccupying the most feasible and level lands; and hen we cannot imitate the course which has proved seful to them, to substitute, according to our best dgment, some method resembling that, which ay be equally useful to us.

I was led to these remarks by reading in the E. Farmer, Nos. 28 and 29, of the present vol. r Phinney's Address, and therein his statement his mode of raising corn on green sward .his I had before read in 1829, and it struck me nitate him. But we had long before adopted a the stalks and husks under cover till winter, when urse of tillage which I think possesses all ise as possible, till within about a week of ste at least one half of these stalks. inting time, get on my manure and spread it.

t becomes as mellow as the other and equally ed.

ing and harrowing made mellow before planting, and much time and labor are saved in preparing it for planting. In the early part of the season, the corn will not appear very promising and will be uneven, and perhaps will not produce as great a crop of stalks as in the other way; but at the time of producing the ears of corn, the decom-Corn may be grown, and perhaps with profit, posing sward and manure are doing their best to aid that process, and succeed to admiration. Extremes of drought or wet are less injurious to land treated in this way than the other, the weeds are not half as troublesome and the land is left in a better state.

The second year the land is ploughed and harrowed, sowed with oats or other spring grain and grass seed, made smooth, and laid down for mowing or feeding. Before planting I soak my seed corn and roll it in plaster, ash it at the first and third hocing, and put plaster on at the second.

My method of gathering my corn and stalks is to cut the stalks above the cars at the proper season, bind and stack or pike them in the field, and as soon as sufficiently dried cut them and put them under cover. If this can be done before any great rain falls, I consider a load of stalks worth as much for fodder as a load of good hay. My cattle this year, did not leave uneaten a handful to a load. When the corn is ripe, I cut it up en and now, that we in this hill country with close to the ground with a scythe or sickle, cart it lds of a very uneven surface, could not exactly to the barn or shed, and there husk it, and keep

is thrown into the yard for litter and fodder. lity of his, and avoids much of the labor and This does not cost more labor than to pick and puble to which that is subject. My method with husk the corn, except the carting, and it saves a eensward, and I plant no other with corn, is this great deal of good litter and fodder which would In the spring I feed my land intended for corn as otherwise be entirely lost. My cattle this winter

re field is then, as we term it, ploughed into ridges nothing but what farmers in every town in New that is, the slices of two furrows turned together, England knew before: but if anything has been this. The sale of Mr Colling in 1810 of the same that the edges of the two will about meet, suggested by which, with the same expeuse, one ving a narrow balk or space of unploughed land more bushel of corn to the acre can be grown, one ween the ridges. In about a week the corn is day's work in a year saved to the cultivator or one .nted on the ridges at the junction of the two dollar's worth of fodder or manure, my remarks rows, without any regard to rows crosswise of will be worth what they cost. The farmers in this ridges, as they are not to be ploughed across, vicinity formerly made their ground mellow by At the first hoeing the balk is ploughed up, and ploughing and harrowing before planting; but ext: sward on it turned over, or broken in pieces- perience has taught them that the mode here deeach of the two other hocings the spaces be-scribed is much better in all respects, and it is een the ridges, or rows of corn, are lightly now for corn, very generally practised; and I ughed, and the ground, mixed with the manure would respectfully suggest to Mr Phinney, whether, t on them, drawn up by the hoe to the hills of considering the saving of labor in preparing for planting, which I think must be at least one half, By this mode of cultivation the manure is all and the safe deposit of the manure under the sod for ed, being mostly covered with the furrows, the corn to make a draft upon effectually in time of k, well mixed with earth by the first ploughing his smooth and even land, would not, when the suctrishes the growing corn at the season when our stones, hills, and holes. One of my neight the prices they give, are in proportion to the quals most wanted-that is, when the ears are sat- bors last year tried Mr Phinney's mode on a level lities of the individuals and merits of their proz, growing and filling out. It is no objection moist piece of ground, and it being a wet season, t part of the surface of the ground is not cut he nearly lost his crops. Had the weather or his gree than to anything else; for this purpose they with the plough, but covered with furrows, for ground been dry it would doubtless have succeed-

ring will be slow and laborious, but the other last No. some remarks and queries about dunging their stock, or hire bulls may see how they are de-) not more so than when the ground is by plough- 1 corn and potatoes in the hill. I have often been 1 scended.'

much surprised in learning from paragraphs in your numbers, that that practice should be continued, when such great improvements were making in agriculture, as in Massachusetts. I had before supposed it abandoned as one of the worst of the old fashioned modes of tillage, calculated, with much labor and trouble, to obtain a little present advantage, at the expense of keeping the land poor. Tillage should be so managed as to improve, and not impoverish the soil. If the ground is pretty well manured at broad cast, dunging in the hill is unnecessary. If not, then this mode, if it barely pay the labor and expense, which I much doubt, will leave the land worse. I may be thought an incompetent judge, having never tried that course, nor have I ever tried feeding my children with cider-brandy to make them sprightly at the time and good members of society afterwards, but should as soon think of doing one as the other: this I know is not argument, but strong opinion.

Should I have leisure you may hear from me again.

Plymouth, Con. March 7, 1831.

FOR THE NEW ENGLAND FARMER.

SHORT HORN STOCK.

MR FESSENDEN-For the information of those readers of the New England Farmer who are willing to be correctly informed what Improved Durham Short-Horned Cattle have been, and now are, I herewith - ad you a few extracts from writers which among breeders are now considered good authority .- I also refer the reader to the New England Farmer, vol.viii. No. 30, to the sale of Improved Durham Short-horns on the 31st August, 1829. I should be pleased to have any person, Perhaps I have been too minute, and stated if he can refer me to a sale of any other breed ever made, that for high prices will compare with breed is believed to be the only public sale of Improved Durham Short-horns or any other breed of Cattle that has equalled this sale of 1829. W.

Respectfully yours, East Windsor, Con. March 4, 1831.

From Bailey's Survey of Durham.

· Messrs Collings have frequently sold cows and heifers for 100l, and Bull calves at 100l. Mr Charles Colling has refused 500l, for a cow, and in 1807, Mr Mason refused 700 guineas for a cow.

'These gentlemen let bulls out by the year, the price from 50 to 100 guineas; and the public are to fully convinced of their merits, that these celebrated breeders cannot supply the demand from I kept from the weather, and that left on the greatest need, my method of raising corn even on the gure shoop, which they are as cautious of preserving, as the amateurs of the turf are the I hoeing of the corn, before the dry hot season ceeding crop is to be spring grain, be preferable to breeds of their race horses, and which the takers nmences. The sward is all decomposed and his: at any rate, I think it a good substitute among of bulls are become so well acquainted with, that genitors-more regard being paid to their pedihave books containing the full pedigree of their stock, similar to the stud book of race horses, by ful tothe crops .- If the sward be tough, the first | Since writing the above, I have read in your which any person wanting to purchase any of

From Culley on livestock.

hired into the East Riding at high prices from the neighborhood of Darlington in the county of Durham, where a much superior breed of Shorthorns are found, possessing all the perfections and qualities, which are wanting in the Holderness breed: they are smaller in size, lighter in the bone and hide, and have a much greater propensity to become fat.'

From the Rev. Henry Berry, a distinguished writer and a saga-cious breeder of cattle at this time.

'To the banks of the river Tees separating the counties of Durham and York, reference is to be had to the account of the originals of the Improved Short-horns. There, upwards of eighty years ago, existed a breed of cattle, for a description of which the author is indebted to an old and celebrated breeder now living in Colow, resembling what is called the Improved breed of the present day, excepting that the fashionable roan was not quite so prevalent; they are described in general character also to have differed very little from their descendants. Possessing a fine mellow touch, good hair, light offal, particularly wide careasses, and deep fore quarters, they were also justly celebrated for extraordinary proof when slaughtered, resembling thus closely their descendants of the present day.

An Account of the Proceedings of the Massachusetts Horticultural Society, at a meeting held at the Hall of the Institution, on the 19th of March, 183 L

Report made by II. A. S. Dearborn, President of the Society. Since the last regular meeting of the Society, the Diplomas have been completed, and transmitted to the Honorary, Corresponding and Subscribing members. Communications have been made to the officers of the Horticultural Societies in the United States, England, Scotland and France, on subjects relating to rural economy, and for the purpose of obtaining intelligence in many of the departments of gardening, as well as some specimens or seeds of such new, interesting and valuable varieties of fruits, and plants as may be successfully cultivated in this climate.

Several additions have been made to the library and among them is the New Du Hamel, - a magnificent work in 76 folio Livraisons, containing superb colored plates, of all the varieties of fruits, cultivated in France.

Among the numerons letters which have been received are the following, which merit the special attention of the Society.

1. A letter from S. P. Hildreth, Esq. of Ohio, accompanied by a package of seeds and drawings.

Marietta, Ohio, Sith February, 1831. To GEN. H. A. S. DEARBORN,

President of the Mass. Hort. Society. My DEAR SIR .- I have the satisfaction of announcing to you, that I have this day completed the packing of a box of seeds, cuttings, &e, and forward the same to the care of Messrs Landreths, No. 85 Chesnut street, Philadelphia. The box eontains 50 small packages of seeds, mostly of

our native ornamental forest trees, shrubs, · Many bulls have lately been purchased and creepers, and annual and perennial flowering plants-cuttings of thirteen new varieties of seedling apples, collected from the orchards in this county, one seedling pear, four seedling peaches, and native plum, grape, gooseberry, and crab apple; cuttings from the large native plum at Granville, Ohio. I could not obtain in season, but have sent some of the stones of the fruit, which will doubtless produce the same; also stones from 12 of our best varieties of peaches, some of them very fine. This climate is favorable to the growth of the peach, and seed from a milder region, would probably flourish better in New England, than grown in a climate rather too cold for the peach tree. Accompanying the cuttings, are drawings of ten of Western America, with a letter from the adventhe apples, taken last autumn by Mr Bosworth, who has succeeded in giving very perfect and accurate likenesses of the several kinds; also a piece, representing a basket of Ohio fruit, intended to decorate the hall of the Society, should they deem it worthy so distinguished a privilege. In the box is a catalogue of all the articles forwarded, with descriptions of the new varieties of apples. They are as yet without names excepting three or four kinds, which are noted in the list; the Society will therefore furnish them with such names as they may think most proper. I believe on cultivation, you will find all but two or three of the thirteen, deserving a place among your best fruits. That we should be able to furnish so many new and good varieties of the apple is not so surprising when it is considered that numerous orchards of the very best apples found in the middle and eastern states, were planted and engrafted from 30 to 40 years since; and that the seeds of these superior apples have been generally used in planting out nurseries from that day to this. The fruit of Washington County has for many years been noted for its superior excellence in New O1leans and the towns on the Ohio and Mississippi rivers. Thousands of barrels are annually sent down the river by the farmers of this county. where they bring from two to four dollars a barel. The winter with us has been one of unusual severity; but I do not discover as yet any injury done to the fruit buds by the cold. The lowest temperature was five below zero, of Fahrenhei, the 22d December. It has been for several days in February at zero early in the morning; but we now have mild weather, the rivers open for navigation. and the temperature on the 26th at 66° in the middle of the day. Wishing you continued health, and renewed

pleasure in your horticultural pursuits, when spring shall again revive the sleeping plants, I remain. your friend. S. P. HILDRETH.

York, with a donation of Books.

New York, February 8, 1831. DEAR SIR-I had the honor of receiving the Diploma conferred by the Massachusetts Horticultural Society over which you preside.

I duly appreciate the favor, and will gladly do all in my power to merit the distinction it conveys. With the exception of the general principles of agriculture, the nature of soils, the operation of manure, as connected with my early botanical pursuits, I am yet but a tyro in practical hortitention. Should anything offer in this new field of each I give a short description. inquiry, that may appear worthy of communication to your Society, I shall not be unmindful of of the Platte, in wet ground, in the vicinity of springs

the duty which their kindness has imposed. I beg, too, to say that it will afford me the highest gratification to see you or any of the members of the Society at my residence at Hyde Park, on the Hudson, which I am now cultivating with the view to the great objects of our favorite pursuits.

By the earliest opportunity I will have the pleasure of forwar ling to the Society a few volumes of which I beg their acceptance.

I am, dear sir, with sentiments of great respect. your humble servant. DAVID HOSACK. H. A. S. DEARBORN, Esq.

Pres. of the Mass. Hort. Soc.

3. A letter from John S. Skinner, Esq. of Baltimore, accompanied by a package of seeds, from turous J. S. Smith. Esq. of St Louis, containing a description of the plants from which the seeds were obtained.

Baltimore Post Office, 21st Feb. 1831. SIR-If I have been slow to acknowledge it permit me to assure you that I am not the less proud of the honors you announced to me of my having been elected an Honorary Member of the Massachusetts Horticultural Society .- But the pleasure of being thus associated, even by name with gentlemen of science and efficient patriotism is accompanied by an unfeigned consciousness or my inability to make any adequate return to the

The only contribution I have now to offer con sists of seeds of hitherto uncultivated plants, recent ly received from regions far West which may affor valuable additions to the horticultural products o Massachusetts, if by careful efforts they can be gradually accommodated to your so much more normern climate. I leave to the better judgmen of the Society to say how far the prospect of suc cess may warrant the trouble of experiment; and only beg leave to add that whatever may be the value of the result, it is to Mr Smith, who made the collection, and whose description accompanie: this, that will be due the thanks of the Society while a high appreciation of its objects, and a readiness to co-operate most cordially for their attainment in my humble way, are the only claims that can be offered for its consideration.

Your most obedient servant,

J. S. SKINNER.

St Louis, Missouri, 27th December, 1830.

DEAR SIR - During my travels of nine years in the country on the sources of the Missouri River and in the Territory of Mexico and the United States, west of the Rocky Mountains, and on the coast of the Pacific, I have at different times gathered the seeds of such shrubs and plants as appeared peculiar to that country. Some of these 2. A letter from Doct. David Hosack of New may claim consideration from their inherent qualities, and others may find a place in the gardens of the curious from the fact that they are natives of the nost distant and wild territory of our Republic. It may perhaps be a pleasure to a lady of the Atlantic to gather Cherries or Currants from a shrub whose parent stock is now growing by the bank of a stream that flows unmarked by the eye of civilized man to the calm Pacific. A few samples Linclose to you, in the hope that you will make such a disposition of them that I may in some future time see them blooming in the gardens of the Atculture, to which I am now about to devote my at- lantic. The different parcels are numbered and of

No. I. Large black gooseberry, found on the head

hat burst from the sides of the mountains; where the soil is rich they grow well in the shade. Ripen here about the first of September. Entirely smooth. Society.

No. 2. The Seria Berry, gathered on an eastern spur of the Rocky Mountains, northern dehigh. Size of the Fox Grape.

No. 3. Choke Cherries of a superior kind; they ire found in all parts of the mountains, in the rich soil of the valleys of creeks and rivers. The thrub is from 4 to 7 feet high; in the middle of August when ripe, the berry is a most beautiful purple, and about the size of the Fox grape. field abundantly.

No. 4. The Yellow Current, found on the ources of the Missouri and Platte, on the eastern leclivity of the mountains found in the vicinity of prings and Rivers where the soil is good. The hrub larger than the common current; ripe about he 15th of August; they are larger than any urrant cultivated in the United States. An acuisition to the housewife.

No. 5. The Black Current, the fruit and shrub such like the Yellow, with the exception of the olor : found in the Black hills.

No. 6. The Buffalo Berry, found in the Black ills in gravelly soil along the water courses. The erry when ripe, about the middle of August is a eautiful red. The shrub, about 5 or 6 feet high, of that kind which is supposed would make a ood hedge.

No. 7. The Scented Grass-seed. This grass is und on the west side of the Rocky Mountains, the Columbia river. Grows in damp ground; ould be cut before ripe, when it is peculiarly agrant.

No. 8. Leaves of the Scented Wood. Grow the western coast, south of the mouth of the olumbia. The tree has a resemblance to the ple tree, the largest about eighteen inches in dineter. They may perhaps be restored to their iginal fragrance. I am not certain that the wood fragrant, but know bark and leaves to be so. ne tree is an evergreen. I procured seeds, but

I must request that you would do me the favor acknowledge the receipt of the package, directg to this place.

If in my future journeys to the west, I could all do it with great pleasure.

I am, Sir, your most obedient. J. S. SMITH.

The following resolutions were adopted.

I. Resolved, That the thanks of the Society presented to Doct, David Hesack for his valuadonation of books.

2. Resolved, that the thanks of the Society be esented to John S. Skinner, Esq. of Baltimore, the very acceptable present of seeds, obtained the regions near the sources of the Missouri, d west of the Rocky mountains.

3. Resolved, that the Secretary be directed to nsmit copies of the foregoing resolutions to the atlemen therein named.

As it is desirable that the rare varieties of foren and native fruits should be speedily and exscions should be made, and placed in charge of

New England Farmer, of the kinds, and the time in the part first formed. As this is a very mawhen they will be offered to the members of the

It is deemed expedient that the Committees on fruits, vegetables and flowers, announce, in the livity and clay soil, ripe about the last of Au- New England Farmer, when the exhibitions of rust. A fine fruit, the shrub about 5 or 6 feet those products will commence, at the Hall of the Society. Respectfully submitted by

II. A. S. DEARBORN. Pres. Mass. Hort. Soc.

Boston, March 19, 1831.

The seeds presented by Mr Skinner were ordered to be distributed by lot to subscribers, (along with others that may arrive) on Saturday next, the 26th inst., at 12 o'clock.

The meeting was then adjourned to 10 o'clock, the 26th inst.

The Standing Committee on ornamental Trees, Shrubs, &c, award the premium of three dollars to Mr David Haggerston of Charlestown, for the best specimens of Ca-R. L. EMMONS, Chairman. mellia Japonica. March 14.

FOR THE NEW ENGLAND FARMER.

INQUIRIES CONCERNING BEES.

Mr Fessenden-1 have been much interested and instructed lately, by a perusal of Dr Thacher's Treatise on the management of Bees. The pleasant style in which this work is written has interested me very much in the subject and has induced me to undertake, upon a small scale indeed, their cultivation. But being an entire novice in this employment, and living too in a part of the country where the late improvements in the management of bees have not been introduced, I am desirous of obtaining some information which I could not obtain from my neighbors. I have therefore ventured to apply to you for some information upon this interesting subject, to ask for answers to the following questions, and for any other information which a beginner in this business may need.

1. What is the best constructed hive?

2 Is it better to reserve for the bees the honey which is first made, or that which is last made? In Dr Thacher's book, in speaking of the hive used by himself, consisting of two apartments, the upper one of which is fitted with several boxes, described page 82, he says, 'the bees enter at ike any collections that would be interesting I their door, as is usual in other hives, ascend between the horizontal bars into the several boxes, and fill them first with honey; then the space below the bars, which is always enough to keep them through the winter.' 'This plan succeeds perfectly well, and affords the owner a handsome share of the finest honey in the comb, free from bee bread or young bees.' In the account which is given of the hive invented by Mrs Griffith, (page 96) it is said, it is ascertained satisfactorily that the young brood and the bee bread or pollen are deposited in the hive where the swarm is first put. holes in the cover are therefore kept shut by plugs until the hive be filled. The holes are then opened, the bees immediately pass up, (into a box placed upon the bive) and if the season be propitious, they fill the upper box with comb and honey, which, as there is neither broad nor bee bread, is of isively cultivated, it is suggested, that collections to be a contradiction between these two statements. Executive Committee, for distribution, at some and bee bread were in the comb last formed, and years there was imported of this article from Italy ure meeting; and that notice be given, in the from the latter one would conclude that they were alone, to the value of \$59,881,283.

terial point, I have asked the above question.

3. Is it better to purchase an old hive at this season, or to wait until the hives swarm, and purchase a new swarm then?

4. If a hive constructed on the old plan be purchased, is it advisable to attempt to transfer the bees to one of an improved kind?

5. Which kind of hive affords the greatest facilities for observing the bees while at work, and which preserves them most effectually from the depredations of the bee moth,

By answering the above questions, particularly the second, you will much oblige

A COUNTRYMAN.

EXTRAORDINARY MILCH COW.

Mr Fessenden-As much has been said in your paper of the produce of extra cows, of the improved breeds, I send you the following as the returns given by a Nalive Cow, belonging to one of my neighbors, the correctness of which I will vouch for. S SERGEANT.

Stockbridge, March 15, 1831.

An account of Butter made by one cow for 3 years.

	lbs.	ozs.

The above is exclusive of 25 lbs, 9 ozs, made while fattening 3 calves, and furnishing a family of 4 persons with milk and cream. The cow was kept through the summer wholly upon grass; in the fall she was fed with the tops of corn stalks, pumpkins and potatoes, and in the winter with a small quantity of bran and cob meal.

Cultivation of the tea plant at the Cape of Good-Hope,-The colonists at the Cape have been for some time speculating on the cultivation of the tea plant. The South African Advertiser states, that Mr Rhenius, one of the governors of the Cape, raised tea sufficient for his own consumption. It states that the tea plant is hardy and vigorous, and will grow any where, from the Equator to the 45th degree of latitude, but the best tea is produced between 25 and 32 degrees of latitude. It is supposed, if Chinese acquainted with the cultivation could be induced to come to the Cape, even for a time, that under their instruction it might be brought to perfection; but the great difficulty appears to be, how to induce such Chinese to come among them; for which they seem to build their hope on the effect of opening the trade between England and China, which they suppose will cause a much greater number of Chinese, than heretofore to visit England and the colonies in the line of voyage.

Raw silk .- The following facts from the work of R. Randall, Esq. in the library of congress being a view of the silk trade, and the measures of the British government relative thereto, will show the immense value of this article of commerce.

During the term of seven years, from 1821 to 1828, there were imported into Great Britain, the finest and purest kind.' There appears to me 24,157,586 pounds of raw silk, which at \$5 the peund, cost \$120,787,580. It also appears from From the former it would appear that the brood the same work, that during the like number of

REPORTS OF THE

MASS. AGRICULTURAL SOCIETY IN 1830 Continued from page 261.

MANGEL WURTZEL.

5. The committee take pleasure in recommending the premium of \$20 to be paid to Mr Gideon Foster, of Charlestown, Middlesex County, for his admirable crop of mangel wurtzel. If so large a quantity of this valuable vegetable has been raised by any one in this country, on an acre, it has escaped the notice of the committee. The largest amount that has been presented on any former occasion, was it is believed by Messrs T. and II, Little, of Newbory, which fell a little short of 1000 bushels. It will be seen by Mr Foster's well prepared statement, that, measuring by cart loads, he had 1413 bushels,-that weighing by the cart load, and taking the standard weight of 56 lbs. the bushel, he had 1542 bushels, or \$6,455 pounds, upwards of 43 nettons.-For this premium there has been no other claimant but the committee hope and believe, that it is not hence to be inferred that our farmers do not generally of those vegetables for cattle, a half acre had been proposed instead of a whole one, there would have been numerous competitors. It may be thought advisable, another year, not to insist on an acre and to have several premiums for the same article. Considering the length of our winters in this and desirable is it that we should feed our cattle on something besides dry fodder-some food which is, at the same time, succulent and nutritions. No climate is better adapted than ours for mangel two, and about equally productive,) ruta baga, common turnips, carrots, parsnips, potatoes,-and of all these, cattle are very fond, and most, if not all of them, form the most wholesome and favorite food of sheep and swine. Consider the value of those crops, too, by the acre, compared with hay, and that any season good for hay will be to the acre, of ruta baga 25, of potatoes nearly 18 through the winter. tons. Of sugar beets, carrots and turnips, it is prea ton and a half or two tons of hay on an acre, 1433 bushels or 86,961 lbs, or 43 tens, 961 lbs. and though it is not pretended that more labor is possibly doubt its being better to put a small inches in circumference,

portion of our grounds into this kind of culture? We have generally, it it believed, had the idea that mate to be 35 dollars. much more labor and skill are necessary in cultivating mangel wurtzel, sugar beets, and ruta baga. than for corn and potatoes. This notion is natural enough, because we have attended to the latter much more than the former. But we have, in Essex County, is entitled to the premium of \$20 this report, as we had in the report of the last year, the testimony of a practical and nice observer, Mr Colman, who, in speaking this year of ruta baga, says - The whole, from the sowing to the gathering, was not two thirds of the labor usually bestowed on planting, cultivating and gathering an acre of potatoes.' E. H. Derby, Esq. a man of experience in these things, says, in 1825, that 'cabbages, turnips, mangel wortzel, sugar beets, are all raised at as little expense as potatoes, If all this be true of potatoes, it certainly may with truth, be said of Indian corn. We have the opinion of Mr Colman, which is worthy of notice, as to the value of ruta baga for fatting or for store

The following is an account of the culture and product of one acre of Mangel Wurtzel raised by Gideon Foster, of Charlestown in the County of Middlesex, Massachusetts.

The soil is a black loam with a clay bottom, inraise more or less of the mangel wurtzel. On the clining six degrees to the northeast. In 1829, contrary they are led to think, that if as regards most three fourths of the same was planted with potatoes, with a moderate supply of manure in the hills and yielded an ordinary crop; the residue was in mangel wurtzel and grass. Early in the month of May of the present year, there was spread on said land about eight cords of compost manure, and ploughed to the depth of eight inchnorthern climate,-that our stock must be fed es, and harrowed in the usual way. About the from the barn from the middle of November to 12th of May, I sowed the seed in rows by hand, the middle of May, six months,-how important twenty two inches apart. I thinned them from 8 to 12 inches apart in the rows, when they became the size of a goose quill. I should have preferred an earlier period for this part of the cultivation had it not been for the threatened destruction by wurtzel, sugar beets, (the most nutritious of the the wire worms, which were then numerous. Nothing more was necessary in point of enlivation to perfect the crep, but to keep the soil loose about the roots, and the land clear of weeds. which was principally done with scuffling hoes, except frequent cropping of the under leaves, by which I obtained treble benefit. 1st, by obtaining an excellent food for swine and horned cattle : good for them. Perhaps it may be truly said, that 2d, by admitting the sun and air to the roots; 3d, there is as little uncertainty of a good crop of by removing them near to the crown, about the corn and potatoes as of hay. From the claims middle of September, which gave them time to exhibited in this report, it will be found that of heal, so that on barvesting they are found to be in mangel wurtzel there has been produced 43 tons a sound and healthy state for preserving them

They were harvested in the 3d week of Octosumed the same quantities can be raised as of ber. The roots were measured in a wagon body usually bestowed on planting, cultivating, and potatoes or ruta baga: of parsnips not so much; that held twentythree bushels by accurate measbut this last vegetable is the sweetest of all. These urement. This measure was filled 61 times, and are prodigious crops, such as may not, in common there were 10 bushels over. The wagon body raised considerable quantities, were fed off to my seasons, be generally or often realized; but sup- was then placed on its wheels and twice filled (to oxen, dry cows, young stock, and fatting sheep posing one half, or one third as much can be pro- the judgment of those of us present) as formerly, duced, what stronger inducement can be offered and weighed at the patent scales of D. Devens, to every farmer to turn his attention to these Esq. of this town. The average weight of which things? On our farms, we rarely have more than was as per tickets annexed, 14153 lbs. m aking

It was observed by agriculturists who inspected not wanted to raise vegetables than hay, and more the field, that much of its beauty consisted in the manure and particular care, yet as a preparation of uniformity of the size of the roots, none of them the ground for hay, and as forming a most grateful being so large as have been raised by others, while variety in the food of animals, and considering very few of them were small. The largest that the prodigious difference in weight of crop, who can I have known to have been measured, being 253

The actual expense of raising said crop, I esti-GIDEON FOSTER. Charlestown, Nov. 30, 1830.

RUTA BAGA,

6. Rev. Henry Colman, whose farm is in Lynn. for his fine crep of rota baga-741 bushels on an acre, weighing 683 lbs. a bushel, being about 25 tons and a half,

To the Committee of the Massachusetts Agricultural Society on Agricultural Experiments.

Gentlemen-Accompanying this you have the certificates of a crop of Ruta Baga raised this year on my farm in Lynn. From these it will appear that on an acre, measured by a sworn surveyor, on one side of the field, there were gathered 741 baskets full; and that forty baskets of the above named, weighed at the town scales 2750 lbs. net weight. This, allowing 56 lbs. to a bushel, the standard weight assumed by the Society, would give a crop of 903 bushels to the acre.

The turnips were planted on the 29th of June and 2d of July; about one pound and a half of seed was used for the acre; and they were gathered and stored in cellars and in the barn in the last part of November.

The ground on which they grew is a good soil, neither wet nor dry, and bore the last year an abundant crop of onions, and corn the year preceding the last. It was well manured at both times and in fine tilth. It was manured with at least six cords to the acre of barn manure the last spring and sowed again to onions; but the seed entirely failing, it was ploughed, harrowed, furrows struck out, and about eight cords of barn manure spread in the furrows; ploughed again so as by a back furrow to form a ridge over the manure, and the seed sown with a small drill harrow on the ridges, making the rows about twenty inches asunder. As soon as the plants were of sufficient size, a drill harrow, with small shares fixed to it, to cut off all the weeds was passed through the rows; and the plants thinned with a small weeding hoe to the distance of about eight inches apart, and the vacant places filled up by transplanting from the supernumerary plants. They were once more harrowed and cleaned, which was a very small labor; and owing to the very unpropitious weather, were not harvested until very late. Some of them were very large; one weighed 15 lbs. and many were nearly as large. The exact expense of cultivating the acre cannot be estimated, as it was intermixed with other farm work; but the whole from the sowing to the gathering, was not two thirds of the labor

gathering an acre of potatoes. My Swedish Turnips the last year, of which I To the cattle they were of very great advantage; and for feeding sheep, they proved the last year, by an accurate account, worth from ten to twelve and half cents per bushel. The man who has the care of my stock considers them as among the most profitable feed, which can be given either to fatting or to store cattle. Three years' experiment has increased their value very much for these purposes in my own estimation.

I am, gentlemen, very respectfully yours, HENRY COLMAN.

Salem, Dec. 1st, 1830.

he committee are sorry that, after so fine a year, ne should have preferred a claim for the pren on carrots, or sugar beets, or parsnips, or turnips. A better season for raising them ly if ever occurs. As to English turnips, the are of them is so common and easy, and they proved so fine this year, it is really surpristhat no claim should have been presented. it be because they have not been raised by y in sufficient quantity to gain the premium or not rather that our worthy farmers have neted to make application? Whatever may be d as to their not being in the habit of attendo mangel wurtzel, &c, it cannot be said of pips, which have been cultivated always to a ter or less extent, by almost every farmer.

ONIONS.

The committee award the premium of 20 ars to Mr Jos. Perkins, of Newbury, for his of onions. The product by estimate was abushels on an acre. Mr Perkins has supposable between by the society, but the committee believe bis, to be about the average weight of a bushel.

Trustees of the Massachusetts Agricultural Society.

ANTLEMEN—In conformity to the rules and ations of your society, I send you a statement 'e amount, together with the manner of cultage. Of one acre of onions, the growth of

The quality of the soil is a vellow loam, has been cultivated with onions several years. 129, it was sown as usual with onions, withny dressing, and produced between 400 and bushels. The 2d of December last, after rop was off, there were three and a balf of barn manure ploughed in, in ridges,-21st and 22d of April following, the land ploughed and harrowed, and two and a half ils of seed was sown in drills about fourteen s apart. The first hoeing and weeding was June 11th, which cost five days' labor. hold was July 2d, four days' more; the last ing was done the 22d, which cost four do. were harvested early in October, and be-1 9,000 and 10,000 bunches have been

en 9,000 and 10,000 bunches have been need, which, estimating 15 bunches to the s l,(each bunch weighing 3½ lbs. is a fair callion.) together with those that have been top-d ind sold by the bushel, there were 657 bushing.

JOSEPH PERKINS.

wbury, Nov. 12th, 1830.

A claims have been sent in for the best crop tian corn,—for the greatest quantity of vegats raised for consumption on the farm of the dint,—for the greatest quantity on one acre illet, of common beets, cabbages, dry peas, years, mustard seed, flax and hemp.

THE LUCERNE GRASS.

dan advertisement in this paper it well be seen a userne Seed is to be had at Cook & Corngary of the Cook of the Corngary of the Cook of the Consideration of the Seed here advertised is furnished by Mrth Carolin and an English cultivator, now resident in this spind it is very clean and of the best quality. The cultivation of the Lucerne is well worth tentino of the farmers of this region, and bistrict E. Fill of the Cook o

We do not profess to know much about it personally, but the testimony, wherever it has been tried, is strongly in its favor; and we take the following notice of it from the Farmer's Assistant, a very useful publication, which we happen to have.

This grass was introduced from France into Great Britain about 70 years ago; and was first brought to this country by that distinguished promuter of improvement, the late Chancellor Livingston. With the best cultivation and plentiful manuring it will yield from 6 to 9 tons of hav per acre, in a senson. About 20 lbs, of seed per acre, are required, if sown broad east, which is considered a more profitable mode of cultivation for the farmers of this country, than drilling. may be sown with onts; but it seems to he regarded as best to sow this seed by itself, after deep and thorough ploughing. Mr Livingston sowed it with success in September after an early crop of potatoes; and it may well be sowed immediately after a crop of flax; in both of which cases the soil is reduced to a fine mellow mould.

The best soils for it are said to be of the drier kind, such as a rich sand, or a gravelly, or sandy loam. It grows well even in the coldest elimate though it is more productive under the more temperate skies. It comes forward very early, endures drought well, and if cut frequently will renew itself till late in the season.

The first year's crop is not as large as the subsequent ones, and it retains its vegetative vigor about 10 years, when it should be ploughed in; and the soil will be found improved for other uses; it is as good as clover if not better, for this purpose, making the ground rich, friable and light. There is one quality, in particular, which rec-

ommends this grass, for fresh fodder, to farmers in the vicinity of market towns. If moved as often as the growth will fill the scythe, (as it should be for this purpose) it will continue to produce a succession till very late in the senson, Mr Young, a celebrated English farmer, says, for fatting bullocks and pasturing swine this grass may be very advantageously used. When it is made into hay let it be cut while quite green, and without much shaking, as the leaves fall off considerably when dry. A little salt added to it when haid in the mow, would be a great improvement.'—Troy Sentine!

Results of the late Census.—The Washington Telegraph contains official returns of the population in fifteen States, one Territory, and five Districts, which we subjoin, together with unofficial returns from four other States and one Territory.

SEED CORN

I have been in the habit a number of years (says a writer in an eastern paper) of selecting the best ear of two that grows on a stalk of corn, and have found it annually to improve to a very considerable increase. After pursuing the experiment for three years, and establishing the fact in my own mind. that by this method there was a constant and accumulative increase and improvement, I communicated the circumstance to my neighbor-he was quite incredulous, and I invited him to a thorough experiment. We took each our field of equal quality of soil, and richness, lying side by side,-planted them on the same day, and tilled alike as we could; the result was, that his, from ordinary seed, produced nearly 40 bushels; while mine, from the selected and improved seed, gave about sixty bushels per aere. - Genesee Farmer.

LAFAYETTE LAND.—Mr Skinner of Baltimore has written a letter to the American Farmer on this subject, from which we extract the following passage:

'Permit me to make known, as interesting to your readers in Florida, that the illustrious and much beloved Lafayette has sent me, and requested me to execute an unqualified power of attorney, to sell at public or private sale, one half of his Florida Lands. I have no doubt that, in distinguishing me by this mark of his confidence and regard, his leading object was to relieve the good people of Florida, and its capital, Tallahassee, into which his land runs, from all apprehensions of the check which might ensue to the growth of that country, by having in the heart of it a body of 24,000 acres of unoccupied land. I understand much of it to be exceedingly well adapted to the growth of cotton and sugar cane, and of tobacco; but I will give you a more particular description of it when better informed. In the mean time my plan will be, as at present advised, to sell alternate sections, on long credits, to practical settlers, as far as may be, demanding only a small portion to be paid in cash.

Longevity.—It is mentioned in the American Almanac, among the memorable events of the last year, that Donald M'Donald, a native of Scotland, died at Lynn, Mass. aged 108 years.

In the last number of the American Quarterly Review, we find under the head of Longevity, some very interesting conclusions drawn from the 'statistics of mortality,' especially to the lovers of long life. A few of them we shall state.

Parr, an Englishman, born in 1635, was married at the age of 120, retained his vigor till 140, and died at 152. A Dane by the name of Drakenbery, died in 1772, at the age of 147. A Norwegian by the name of Surrington, died in 1797, at the age of 160.

There is good reason to believe that longevity, or rather the value of human life, is increasing. Data as to this country have not been procured. But in England, in 1801, the mortality was 1 in 45; in 1811, it was 1 in 50; and in 1821, it was 1 in 45; in France, in 1781, the mortality was 1 in 23; in 1802, it was 1 in 30; and in 1823, it was 1 in 40. In Sweden in 1755, the mortality was 1 in 35; and in 1775, it was 1 in 48.

From these facts it appears that the proportion of deaths to population is regularly decreasing in Engineering 215,576 and, France and Sweden. The Reviewer has no doubt that the same is true in the United States. It appears also that an improvement has taken place in 31,128 and an arrangement and the united States. It appears also that an improvement has taken place in 31,128 annual mortality was one in 25; in 1751, it was 1,128 annual mortality was one in 25; in 1751, it was 1 in 38; in 1801, it was 1 in 35; in 1811, it was 1 in 187; in 1801, it was 1 in 361, it in 1821, it was 1 40. In Paris, in the 14th century, the annual mortality was 1 in 175; in 1801, it was 1 in 32. Other cities give similar results. The facts are said to be authentic. If so life is daily growing more valuable.

From the Boston Courier.

COL. JAQUES' STOCK FARM.

There are no branches of rural economy so important to New England, as those which relate to the rearing of Horses, Neat Cattle, Sheep, and Swine. They have ever been the great staples of our agriculture and, probably, will long continue to claim the chief attention of a very large majority of the farmers in the northern, and a considerable portion of those in the middle States. They not only afford the principal subsistence and raiment of the inhabitants,-furnish the materials for a vast number of the most valuable manufactures,-sustain the crews, and enter into the equipment of the fleets of commerce and of war,constitute a large amount of the national exports, facilitate the intercourse of the inhabitants, and the labor of transportation, on all the lines of intercommunication, throughout the Union; -but they are the alternate cause and effect of agricultural improvement, and of individual and public prosperity.

The climate and soil of this region are adverse to those valuable cultures, which enrich the planters of the more favored states of the South. have no rich products of the soil, to which the undivided attention of the farmer can be directed, with the confident expectation of realizing a fortune, or a very cheering profit. Sugar, Cotton, Rice, Tobacco and Indigo, are excluded from our tillage; and even Wheat cannot be so generally grown, as to furnish bread for the inhabitants, and we are, to a considerable extent, dependent upon for such an establishment, than any other place other sections of the Republic, for the staff of

Under these circumstances, the laborious and hardy husbandmen of New England must direct their chief attention to the rearing of flocks and herds; beef, mutton, pork, lard, butter, cheese, skins, hides, and wool, are the most valuable products of their industry; and if woollen manufactories continue to flourish, with the increase of population, in the same rapid manner, which has been experienced during the last ten years, the period is not distant, when the fleeces of the North, may rival in consequence the cotton crops of the South; while the demand for all the other enumerated articles will be augmented, with the extension of foreign commerce, the fisheries, the coasting trade, and the multiplication of hest breeds of cattle, sheep, and swine, should be introduced, and managed in the most perfect and economical manner.

Although the various agricultural societies have done much to encourage inquiry, and induce attention to this subject, and many intelligent, and patriotic individuals have made commendable efforts to introduce the most celebrated foreign stocks, and to improve the existing varieties of native animals, by judicious selection, and crossings, still much remains to be accomplished. But few, comparatively, of the proprietors of land, can afford to make the requisite experiments, for ascertaining the most perfect and profitable breeds, and the best mode of rearing them. Eminently superior species, and varieties, are costly, and must be either imported, or obtained from a distant part of the country, which cannot be done, without much trouble, hazard, labor and expense. This has been made manifest in relation to Merino Sheep, Durham Cattle, and the Arabian, Cleve-

about being carried into effect, by which these difficulties will be, in a great measure, surmount-

Col. Jaques, who has long been distinguished for his superior intelligence and skill, in the management of the most valuable kinds of domestic animals, has been induced to undertake the establishment of a Stock Farm, in the vicinity of Boston. It is to be 'Devoted to the important objects of breeding and rearing the best breed of horses, neat cattle, sheep and swine; the receiving and selling on commission, all kinds of live stock; and combining also with these the business of Agriculture and Horticulture, upon the most approved and economical system. The business also of disciplining young and refractory horses, and rendering them safe, for all useful purposes, will be attended to; and if found necessary, and sufficient encouragement should be given, a well educated Veterinary Surgeon may be attached to the establishment.

Col. Jaques has been encouraged to proceed in this excellent plan of an Experimental Farm, by the Massachusetts Agricultural Society, and the patronage of a great number of his liberal fellow citizens; and such are his cheering prospects, that there can be no doubt of ultimate success,

The 'Ten Hills Farm,' Charlestown, within fifteen minutes' ride of the city of Boston, has been selected, as extremely well suited to the above purposes. It combines, perhaps, more advantages in New England. The location is most favorable, being completely retired, yet easy of access. The farm, containing 222 acres, is made up of a variety of soils, and is capable of affording appropriate compartments, for all the branches of intended experiment.

Besides the advantages which will result from such an establishment, so far as respects the breeding and nurture of useful animals, every department of rural economy will be practically illustrated, in a manner which cannot fail of being highly beneficial to the citizens of the Commonwealth. England and France have offered glorious examples of the salutary influence of similar institutions. Societies have been founded for diffusing intelligence among all classes of the cultivators of the soil, while Experimental Farms and Gardens manufactories. How important is it, then, that the have been formed, either by associations, the government, or the affluent and enterprizing proprietors of landed estates.

The Experimental Gardens of the London and Caledonian Horticultural Societies, at Chiswick and Inverleith-the Jardin des Plants in Paristhe Institut Royal d' Horticole at Fromont-the Veterinary School for teaching of Rural Economy at Alfort, and the National Farm of Rambouillet -have been deservedly celebrated, and are considered among the most useful institutions of modern times.

Letters, Natural History, and the exact sciences had been more completely developed, by the aid of an infinite variety of public and private associations, in all the civilized nations of the eastern hemisphere; but agriculture and gardening still lingered in the rear, until like means were employed for fostering their advancement. If Great Britain took the lead in husbandry and gave the first impulse to improvement in each department of tillage, her continental rival, in the arts of civilland, Hunter and other remarkable races of horses. lization and in national glory, has not neglected to line from the end, insert only after nor.

Fortunately, a plan has been matured, and is profit by the precedent: and when the citizens the United States, have so ardently entered t same honorable career, they must not be deficis in any of the means which have elsewhere be employed, and are so indispensable to insure si

> To great practical knowledge, Col. Jaques uni a natural taste for the various objects which has undertaken to promote; and he is urged by that intelligence and generous enthusias which ever insures satisfactory results. With t public good for a motive of action, there came be a doubt that he will receive all that assistan from public and private munificence, which m be required, to enable him to present such an e perimental and stock Farm as shall do honor himself, and the Commonwealth.

COLUMELLA.

TURNIPS FOR SEED BEDS.

In the 270th page of the current volume of t New England Farmer, we adverted to a mode f obtaining early cucumbers by sowing the see in turnips scooped out for that purpose, a hastening their germination and early growth hot beds. Since that article was sent to the prewe have been assured by a horticultural frier who has often tried the experiment with success! results, that the encumber plants flourish be when the turnips are pared previous to their being placed in a hot bed. When this is omitted t outside of the hollowed turnip is apt to become tough and hard, and thus prevents in some me sure, the inclosed roots of the young cucumb plant from penetrating the shell of the turnip, a finding nourishment in the adjacent soil.

CUTTING TIMBER.

February is undoubtedly the best month in t year for cutting such timber as we wish to ha durable. We would therefore recommend it farmers, to cut their timber for rails and oth purposes, before the frost is out of it, or the s begins to circulate. The less sap timber has in when cut, the longer it will last, other circumsta ces being equal. When trees are felled, it is u doubtedly better to let them remain until sprin at full length, that the bark may be the mo easily peeled off, which is a very important thin. when the timber is to be used for rails, which should be split as soon as the bark will come of that they may have the benefit of seasoning di ring the summer. If farmers will attend to the they will find their rails will be worth fifty p cent more than when cut after the sap begins ! rise. Genesee Farmer.

REMEDY FOR LICE IN CATTLE.

We have been informed by a gentleman wh has for many years kept a large stock of cattle that fine dry sand scattered on the back, neck an sides of the animals is an effectual remedy again these vermin. He collects dry sand, and puts in a box or tub in the barn, and occasionally ap plies it during the winter by sifting or strewing over the body of each creature with complete suc cess in ridding it of its troublesome guests.

(Within 10 miles of Boston,) consisting of 20 to 30 acres of first rate land, having a comfortable house, harn, &c. A line, stating particulars, addressed to II. L. T. box 556 Post Office, will receive attention. 31 Boston, March 9.

Treatise on Silk.

Just published, and for sale at J. B. Russell's Seed Store, 52 North Market Street,

A Practical Treatise on the Culture of the White Mulberry Tree and the raising of Silk. Price 121 cts. \$9 per hundred-a valuable agricultural tract for distrihution March 16.

Spring Wheat.

For sale at the Seed store connected with the New England Farmer, 52 North Market-street,

A few bushels of genuine GILMAN SPRING WHEAT; this sort is the most valuable one cultivated in New England, is very productive, seldom if ever attacked by blight, and is the kind which has for many successive years obtained the premium from the Massachusetts Agricultural Society. March 16.

Cow Cabbage,

Just received, at the Seed Store, No. 52 North Market street, from London a small quantity of Seed of the Cow Cabbage; it is thought that no plant cultivated in this country will give so much fodder from the same space of ground, for Milch Cows, as this. It has been successfully cultivated to a large extent in New England and the Middle States the past year, and promises to be a great acquisition.

Spring Rye.

Wanted immediately a few bushels of genuine Spring Rye, plump, for sowing—for which a liberal price will be paid at J. B. Russell's Seed Store, 52 North Market st.

Seeds for Country Dealers.

Traders in the country who may wish to keep an assortment of Garden Seeds for sale, are informed they can be furnished, at J. B. Russell's Seed Store, connected with the New England Farmer, 52 North Market Street. Boston, with boxes of various sizes and prices, from 10 to \$50, containing a COMPLETE ASSORTMENT of the seeds mostly used in a kitchen garden, on as favorable terms as they can be procured in this country, of equal quality, neatly done up in small packages, ready for retailing, with short directions on each package for its culture and management—warranted to be of the growth of 1830, and of the purest quality. Nov. 5.

Black Current Wine.

For sale at the Agricultural Warehouse, 52 North Market Street-

A few dozen bottles of superior old Black Currant Wine, made by a gentleman in this vicinity; an account of its astringent and detergent properties in various complaints, and particularly the Sore Throat, will be found in the New England Farmer, vol. v. page 567, written by Samuel W. Pomeroy, Esq. and the late Dr John G. Coffin. Price 75 ets. per bottle-also, a few bottles of old White Dutch Currant Wine, price 50 cts. per bottle. Dec. 31.

Rees.

Gentlemen in want of swarms of young thriving bees can be supplied by J. B. Russell, at his Seed Store, No. 52 North Market Street, at 17 cents per lb. The bees were raised by Mr Ebenezer Beard, inventor of the new atent bive.

No Report has been made this week of prices of Cattle at Brighton.

MISCELLANY.

From the American Farmer.

THE FARMER'S VERNAL ODE.

THE farmer's joyous season, Comes gaily tripping on; Its heralds are the gentle airs, Warm'd by a genial sun. And now he wends him o'er each field, Each hedge and fence along; And through the groves and o'er the hills. His gladden'd herds among.

And joyously he views them all, From dreary winter free; And feels as doth the mariner, Just from the boisterous sea. Though herbage sere and leafless boughs, Arrest the careless view; He sees the living germs that peep, Their winter shelters through.

And gladsomely he greets them all, Those little buds of hope; Which soon will 'neath the genial sun, Their fragrant flowrets ope; From which he'll see the future fruit, Emerge and ripen soon; And thence the farmer's store of joy-Of hope the promised boon.

O! deem not tame such pleasures, As come with spring's return, To fill the farmer's bosom,-Nor vet their offerings spurn. For Oh! of earth the sweetest, The purest joys we sing; Are those the farmer feeteth At the return of spring.

We find the following story in the Journal of change the saddles? Commerce, which may not be an unseasonable hint at this time:

Not far from the year 1796, a brig from Russia laden with iron, ran aground upon a sand bar, that makes off from Newport, R. I.

The master was disposed to unlade and get her off; but the weather was extremly cold, and none could be found to undertake the task, as the vessel was at a distance from the shore, covered with ice, and exposed to the full effect of wind and cold.

Capt. G ..., a packet-master of Newport, resspected for his integrity and who abstained from the use of spirits, at length engaged to unload the brig and procure his own hands .- Six men were employed in the hold, which (the vessel being and the custom of visiting of an evening so much bilged) was full of water. They began the work with free, but temperate use of spirits, thinking they should need it then if ever. But after two hours' labor, they all gave out, chilled through. After refreshing and warming, they made a second attempt, using cider only the remainder of the day. They now succeeded better, but still they suffered much from the cold. The second day they consented to follow the directions of Capt. G. and drank nothing but milk porridge, made rich, and taken as hot as the stomach would hear it. The weather was equally severe as before, but they were now able to continue their work from simple beverage handed round every half hour, terest in American talent.

they continued their work from day to day, with not one drop of spirits, till all the iron was handed out and brought to shore, and not a man had a finger frozen.

Doctor Franklin was once a member of a body in which it was contended that a certain amount of property (50 dollars, we think) should be required to lake. The soil is principally a sandy loam, much c constitute a right to vote. The Doctor was opposed to it. 'Today,' he said, 'a man may own a Jackass, and he is entitled to vote; but before the next election comes, the jackass dies. The man, in the meantime has become more experienced—his knowledge of government and his acquaintance with mankind are more extensive-and he is therefore better qualified to make a proper selection of rulers; but the jackass is dead and the man cannot vote. Now, gentlemen, pray inform me, in whom is the right of suffrage? Is it in the man, or in the jackass?'

The young princess Esterhazy was a great favorite of George 4th. At a ball given in honor of his majesty's birth-day, the young ladies were each expected to kneel and present him with a nosegay; but the princess declared that she was of royal blood, and would not submit to such degradation. The king received her graciously notwithstanding this obstinacy; but the governess sent the child to bed immediately after dinner. 'It is very good for digestion,' said the little princess. This enraged the governess so much that she took her out of bed, and whipped her soundly. 'It is very good to circulate the blood,' said the princess. Next day the governess resigned .- Life of George 4th.

A formal old gentleman, finding his horse uneasy under the saddle, alighted, and called to his servant in the following manner:- 'Tom; take off the saddle off my bay horse, and put it on the ground; then take the saddle from thy gray horse, and put on my bay horse—lastly, put the other saddle upon thy gray horse.'—The fellow gaped all the while at this very long preachment, and at last cried out, 'Lack-a-day, Sir, could you not have said, at once,

'I was charmed,' says Lord Oxford, 'with the answer of a poor man in bedlam, who was insulted by an apprentice, because he would not tell him The unhappy creature at why he was confined. last said, 'Because God Almighty deprived me of a blessing which you never had.'

Conversation .- It is a secret known but to few, yet of no small use in the conduct of life, that when you fall into a man's conversation, the first thing you should consider is, whether he has a greater inclination to hear you, or that you should hear him.

A good fashion to follow.-The state of society in London is much changed of late; the great assemblies continue, but there are so many distinct sets, prevails, that several ladies who have influence in society sit at home, and receive without the gene of dressing and meeting in a crowd. They see their friends in a quiet rational way and it must be admited this is a great novelty.

The Aurora Borealis has for months past appeared in England, with a brilliancy unequalled in that climate. A comet of unusual size and splendor, and zodiacał lights have likewise been seen.

J. & T. Doughty have issued the third number of the Cabinet of Natural History, and American Rural Sports. It is a beautiful and valuable book, and we four to seven hours at a time, and then came up, hope it meets abundant patronage. The drawings are from the pencil of T. Doughty, whose exquisite as Capt. G. expressed it, 'smoking hot.' With this landscapes everybody remembers, who takes any inValuable and Chcap Land-for Sale.

The subscriber offers for sale, 14,000 acres of che Land, situated in the town of Pinckney, county of Le and state of New York. Some of the land is impre and under cultivation. The country is remarkably h thu, being entirely free from the fever and ague and f the common bilious fevers which often afflict the to upon Lake Ontario, this town being 18 miles east of covered with rich black mould. The timber is chi Sugar Maple, Black Ash, Butternut, Beech, Elm, The land yields first rate crops of Grass, Rye, Oats, ley, Potatoes and Flax; and on some lots, good Wi and Corn may be grown. To those wishing to obtain perior grazing farms, a line opportunity now offers it The produce of pasturage and hay from an acre of land, is very large, fully equalling if not surpassing from the same quantity of land in any other of the I River townships. The land is admirably well wate there being but few lots which have not durable rum streams upon them. The land is well adapted to Orch ing-the Apple tree thriving very well in this cou Stock of all kinds may be disposed of with the least p ble trouble, and to the greatest advantage, the dro purchasing at the very doors of the farmers, and pay the highest cash prices for their cattle, which will refind purchasers at all seasons of the year. Several mers at present residing on this town, were origin from the New England States, and some of them i Massachusetts, who are in thriving circumstances. above described land is offered for sale at the very price of from two dollars and a half to three dollars acre, for the uncleared land, and from three dollars a half to five dollars and a half for the improved lots. land will be sold in lots to suit purchasers, and from to five years' credit for payment, in annual instalme will be given. As a further convenience to purcha the subscriber will receive in payment, Cattle, Sh Perk, Grain or Grass Seed, for which products he allow the highest cash prices. The title to the la indisputable, and good Warranty Deeds will be give purchasers. Persons desirous of purchasing will pl to apply to the subscriber, at Henderson Harbor, co of Jefferson, State of New York, or to DAVID CANFIL JAMES H. HENDERSO. Esq. on the town. ep16t March 9.

GRAFTING GRAPES.

Mr Fessender—Observing in your Farmer of 9th inst. a piece signed . In . Imateur,' solicitfrom some one, who grafted grapes the last ison, for their result and information upon this piect; and no one offering, the season passenture to offer a few observations with a statent of facts on grafting vines the last season. intelligent member residing in the vicinity of ston, upon the same subject.

Some time in March, say about the middle, we Leight wild grape vines grafted with the Chasis grape, three on large, old vines, of an inch I over in diameter-and five, on cuttings of the d grape vine set out in the spring of 1828. ey were not large when grafted, the scions being ger than the stocks. The scions engrafted the three old vines did not grow; they kept e some time, the buds swelled, and some of n opened; the leaves expanded, but finally died; atched their progress with particular attention my conclusions are, they were grafted too y; as the sap flowed so long, and abundantly, ore it became glutinous, and adhesive, that the at was water soaked and died at the bottom, igh the top, as I before observed had the apance sometime of doing well. The other small vines did better; four of the five took I and grew astonishingly fast; the flow of sap small compared with the old vines; some of thin grew from twelve to fifteen fect in height, very rapidly, after the scions had taken to the at k; some days the vine grew thirteen inches per a surement.

he above mentioned vines were operated on left grafting, and grafted in the ground, the soil uled round them. Hereafter we shall alter in e respects, viz; where the stocks are large I bore in them, good sized stocks that pinch he scions tight, let them remain without tying eee of bass mat round them; smaller stocks, ald be well tied, for I observed in those that a during the flow of the sap .- Have them ed and the dirt hauled over the clay.

(Copy of memorandum handed me.)

and clayed on the common wild grape. The rules, however, we will repeat here: t bore fruit, but it did not come to maturity.

grafts set from 15th April to 15th May in this cli-branch off in several directions. mate more likely to do well that those set earlier. S. DOWNER.

BEES.

Mr Fessender-I was much gratified with the many facts which appeared in the correspondents between Drs. Thacher and Smith, respect. ing that interesting creature, the Honey Bee; and I think, that we may reasonably expect, as they have an intelligent and acomplished lady to assist them, that further valuable productions will appear.

The government and economy of the bee are not yet thoroughly understood. Many of their movements are enveloped in darkness. They manifest much art and sagacity in the construction of their habitation. Undoubtedly they have a language which we do not understand. They know an enemy from a friend. They have a wonderful policy-nectness, economy and industry mark all their steps. They have never informed us of their counsels and results, nor of the management of their internal affairs. It seems, however, that their government is a monarchy and the sovereign a female. But are we correct? Is the chief ruler a female? If so, her majesty must act the strange part of a coquette in commanding a large retinue of admirers to be massacred without distinction. This looks unnatural; but were those, which are marked out for destruction, merely a pack of lazy fellows, that had grown fat by rioting on the proceeds of the laboring part of the community, it would, perhaps, appear otherwise,

Man, it seems, is unwilling to allow these insects any faculty, except merely innate instinct, with which they are endowed. But how do we know that they do not, in some degree at least, improve in their arts? Instinct is a term given to the sagacity and natural inclinations of animals of the rafts of the Chasselas set 5th April, 1830, grew rules for putting up lightning rods, which our cor- lower creation; and reason is the term given to at 15 feet same year, grafted (by cleft graft- respondent might do well to consult. One of those the sagacity and comprehension of man. Where lies the difference? How do we know that the 'The rod should descend into the ground far insects are not capable of planning and comprehending their work? In many of their operations they seem to possess the faculty of perceiving what is right and best, and in fact to perform actions or things which seem to proceed from mozeter growth than those set by boring holes, of lamp black to keep it from rusting; when the no improvement by observation, instruction, or exones? *

think? No one will answer the latter part of the this season of ripening, either of foreign or do-A system of organs is necessary for the action of than a principle, having neither length nor breadth, be relied on as genuine. is incapable of itself of any action or thought, In order to produce actions or thought, the soul must be connected with proper organs, and the more perfect the organs, the more perfect will be insect can be no objection to the position here advanced. Admitting the position to be true, it does not follow, that the insect is endowed with the same faculties which eminently distinguish the human race: much less does it follow that because they have a soul, there must be a resurrection after death. However, if after death they should be brought to life, like Doctor Franklin's flies which were drowned in wine, bottled in Virginia, and resuscitated some mouths afterwards in Europe, they would be actuated by the same soulbeing the self same insect. On the whole, we believe the hypothesis to be true, that the Bee has a soul, and that it has proper organs for the union and action of this principle, and that the organs are more perfect than those of many other insects, and less perfect than those of man,

MASSACHUSETTS HORTICULTURAL SOCIETY.

At an adjourned meeting held on Saturday, March 26, at the Hall of the Institution, the following letters were read, and the scions which accompanied them, together with the seeds presented to the Society by J. S. Skinner, Esq. of Baltimore, were distributed among the members of the Society.

MR J. B. RUSSELL-Dear Sir - Accompanying this, you will receive a package of grafts for the use of Massachusetts Horticultural Society, which I mentioned to you in a letter in the winter, desiring you to purchase me some grafts, &c, which I have heard was for-tural Society will be held on Saturday next, at It o'clock. warded from Philadelphia by Mr Amory, a merchant of Boston. They are marked as follows viz. No 1, the Ashmore apple, (see N. E. Farmer, vol. ix. page 109.) No 2 Sweet Paradise * apple. (See the N. E. Farmer, vol. vii. page 256.) No 3, the Shenck pear, a seedling, large and very superior, a plentiful bearer, ripeus in August. It was reised from the seed of a small harvest pear, planted about 40 years ago by the late Mr John Shenck of Manor Township, Lancaster County, Pennsylvania. I obtained the grafts from Mr Philip Barger, Mr Shenck's son in law. Those marked xx are off the original tree. Those marked xxi and xxii off young trees grafted by Mr. Shenck, from the original and which his daughter, Mrs Barger, says, bear rather larger fruit than the old tree. I have engaged some of the fruit to send to the Philadelphia Horticultural Society

REMARKS ON LIVE STOCK.

The following from a Treatise on Live Stock, by suggest useful ideas to American Farmers,

In the first place, it would seem that the larges domestic animals are not the best, or most advantageous to the breeder or feeder; because we generally find, that the large big-boned cattle and sheep require more and better food in proportion a support and feed them, than those of a middling size and small bones; and the larger, bigger bon ed, and clumsier they are formed the more un profitable they are, while, on the contrary, the truer they are formed, and the finer the bone, the more profitable, as they not only take less food in proportion, but feed more readily.

I aver that no large boned animal will feed a quick, or cover so readily and thick with fat flest as one with a small bone, if well formed. This is the criterion-this is the main principle that we found our judgment upon, respecting all animals which are to be fatted for the support of mankind and we can justly say that this judgment is constanding this assertion is made with some degree of positiveness, yet we are not unconscious of it being a new dockrine to the generality of breeder in this island; and, consequently, will appear sur prising and strange to many old breeders and graziers. But I have not a remaining doubt, i the advocates for large bones will make fair and candid trials, the small bones will win or gain the prize, nine times out of ten, or rather every time THOMAS LEONARD, of Salem, were admitted mem- may I am inclined to think, that the small boned bers at the stated meeting of the Society, held on true proportioned animal will pay 4d, while the big boned one will only pay 3d. for what i Several beautiful specimens of Gilly flowers, viz: cats. - When I assert this I would wish to be un lambing, to the time of killing for the market; be cause I look upon the grazier, who buys in an feeds, and he that breeds and feeds, as two ver different people. It is the latter of those that the public are obliged to for that useful observation of small boned animals excelling large boned one in feeding; because he sees, watches, and examine the various pushes and improvements from the beginning to the end; while the grazier, who buy in his stock is easy, in a great measure, how they are bred, so long as they pay him for feeding. A plain, coarse, ugly animal may pay him more that a fine well made one; because he buys the coarse one at a much less price in proportion, and it is of little consequence to him as an individual: but, k his country, to community at large, it is a matter I observe that the 4th of April is mentioned for of prodigious importance, much more than has a given quantity of pasturage, turnips, cabbages, The beef or mutton is finer grained, and sells

om if possible, or as near to them as may be. It mountain sheep. rhaps, has been owing to the idea of largeness, the wish to breed the biggest in the different ids of domestic animals, that has so long prented our breeders from selecting and distinguishthe most valuable kinds : for, so universal was s idea, and so much were we blinded by it, that did not perceive which were the most valuaanimals of each kind. We had no conception any animal being valuable or good that was great. We could not seperate those two ideas good and great. We did not attend to that symtry and proportion, which so essentially charerize the valuable kinds of each species, and ich seldom, or ever, fail of being the hardiest, and best thrivers. In short, it was left to this age to ke those nicer distinctions, which constitute the e breeder and discerning judge; and the more se distinctions are attended to and examined, more they will be pursued; in consequence of ich improved notions, our breeders must now essarily follow those kinds that are most valua-

TURNING IN GREEN CROPS FOR MANURE,

8. To Mr William Buckminster, of Framingham, Middlesex County, the committee award the premium of \$20 for his experiment of turning in green crops as a manure,' This attempt of Mr Buckminster, in the judgment of the committee well deserves the attention of farmers, and particularly of those who live too far from a city or town to buy manure. The practice of enriching or renovating land by ploughing in green crops, is a very common one in Europe, though hardly known here. But would it not be well to try it? Our farmers in general have more land than they can till, owing to their not having manure enough, or because it is too far from their barn yards; and hence it is that some large farms, and naturally of good soil, actually produce less, but with infinitely more labor, than much smaller ones that are well cultivated. Indeed the desire of having large farms, without giving to them the necessary outlay is the common error of our country. The inevitable result is scanty crops and more labor. An acre is mown, often, for a ton of hav or less, where with decent care two tons might be had. A pasture often of a dozen acres, which might be easily ploughed, does not afford food enough for one cow; whereas at small expense, it might be made to support four or five. Now, in a country like ours where produce is so cheap and labor so dear, this is unquestionably a wrong, not to say a ruinous mode of management, - a mode which drives our children to the Western or Eastern country for want of land, who might have enough here if rightly used. But if farmers will have more land than they can till in the ordinary way, for want of manure, what better plan can be devised than that of ploughing, and sowing, and turning in the green crops, with the soleview of fertilizing their lands? Whether it be afterwards used for mowing, or tillage or grazing, still it must be good husbandry, if we can rely on the testimony of Mr Buckminster, and on the experience of farmers in England.

The remarks of Mr Buckminster on bog or meadow mud, are worthy of notice. It is quite certain, as he says, that used in its crude state, as dur from the meadow, it is inert and seemingly useless: but when put in the barn yard and hoggen, and trampled upon and mixed with manure, it becomes an excellent compost. As almost every farm has bog meadow, it must be well known, that after being several months in the barnyard or pigsty, it makes an excellent manure for corn in the proportion of about two thirds mud and one third dung. Whether Mr Buckminster's notion of carting it at once to the ground where wanted to save labor, and there mixing it with manner, is a correct one, every man will judge for himself. The common idea has been, that to take it to the harnyard first is better. But all must agree that it may be very profitably used as food for plants, and therefore ought not to be overlooked in the management of the farm.

To the Trustees of the Massachusetts Agricultural Society. I have been induced, partly by the premium you

three and a half acres of pasture that had, for possible to enrich them otherwise than with stable many years, been tilled by the former owner until manure. If they would plough and sow properlies the crops would not repay the labor. It was a they could make the whole rich, light loam, but not sandy. It had been so reduced, that IO acres did not afford sufficient pasturage ploughed in; for, say they, 'The growing cror for one cow through the season. We sowed im- will exhaust the land as much as it will enrich the mediately after thus plowing, a bushel of buck- same when ploughed in, so that we end where we down the buckwheat in the direction we in- edly, if the growing crop obtained its whole sus tended to plough, and then ploughed and sowed tenance from the ground. It probably does not as before. In the latter part of August we turn- one sixth part. It was the knowledge of this ed in a second crop of buckwheat-having rolled principle that gave me confidence of success it down that as at first, and then seeded it down in the experiment. The advantages of green with clover, herds grass and red-top, one peck and crops for manure are greater where the lands are a half to the acre. Most of the clover was winter distant from the barn, than in other cases. killed, and a great part of the herds grass and red-top. Early in the spring of 1829, we sowed 10 lbs. of clover seed to the acre; and with a manure. In April, 1828, I carted 30 loads of mud light harrow, went slowly over the whole. The or muck from a pondhole, which had a black soil 4 seed took well, but the clover was not high enough feet deep. I thought it must be valuable manure cut. We moved what had not been winter kill- grown on it for 20 years, owing to its sunken posied; and where it yielded best, we obtained one tion. The 30 loads were immediately spread on ton of herds grass to the acre. Immediately after an acre of worn-out land, and ploughed in. White mowing, we turned in our cattle, and fed the grass Beans were planted on a part, buckwheat on a close. Last spring, (1830) the grass was so for- part, and barley on another part. No crop worth ward we turned in our cattle on the 19th of April, cutting was produced. The muck did no service, There were 8 acres in the whole field, but there either last year or the year before. Last autumn were only five acres that bore any grass worth 50 I tried it again; carted out 15 loads on to the high cents. These five acres were the three and a half land aforesaid, and mixed with those fifteen, two managed as I have stated above, and one and a half on which grass seed was sown in April, gether, and suffered to lie in a heap till the 10th 1830; and fifty bushels of leached ashes mixed with loam, spread on the surface. On these five land as the other, and the whole heap produced all acres, (and the 3 which bore nothing.) I pastured the good effects of clear stable manure. I raised 4 cows constantly for 4 months, wanting two days, and they had an abundance of feed. I never had any pasture ground yield so well before. I think these green crops improved the land as much as muck raw or green, and applying it after it had a good dressing of manure, and the comparative been six months fermenting in a mass, thawing expense I estimate as follows on one acre, viz.

WITH MANURE.

20 ox cart loads of manure Hauling 3 mile and spreading Ploughing once, green sward Harrowing and sowing

WITH GREEN CROPS. First ploughing, green sward 2d ploughing, and rolling with man and horse I 00 ingredient lies. This will save a double earing 3d ploughing, and rolling do. Three harrowings do, Two bushels buck wheat Sowing

Thus you will see, that it has cost me less than one fourth as much to enrich my land with green crops, as it would with manure. If my grass had not been winter killed the first year, I intended to have shown you the precise weight of hay cut before the public another experiment of Mr Buckon an acre. The above estimate of the cost of minster's for which he or Mr Clark, of Northamp manure is less by I2 cents per load than it can be ton, may become entitled to a premium of \$50 purchased for in this place. I have given more the next year :- it is for an acre of the yellow bwithin 2 years,

(miscalled under improvement) 10 acres of which body. It has much to recommend it. The rawill not pasture a cow. BOG MUD AS MANURE. I have made another experiment on compost for the scythe, when the other grass was fit to though nothing but rushes and skunk cabbage, had loads of stable manure; the whole was mixed toof last May. It was then earted on to the same a good crop of Indian corn from it, without putting on over 20 loads of the compost to the acre. Such was the difference between applying this freezing, &c. to become pulverized.

All our farmers in this quarter, in making com-\$24 00 post manures, carry the most bulky, heavy ingre-5 00 dients many rods-some haif a mile to their cow-2 00 yards and hoggens-and when these materials 1 00 have rested there long enough, they are then carried back again to the fields, I would save them \$32 00 most of this labor. Let them make their compost heaps on, or near the soil where it is to be \$2.00 applied, and as near as possible to where the chief I 00 of half or three quarters of a mile. They will I 00 have to earry nothing but a little stable manure to I 55 that distance in most cases, instead of carting 25 back and forwards the whole mass.

> Respectfully yours, WILLIAM BUCKMINSTER. Framingham, Nov. 10, 1830.

YELLOW LOCUST.

9. The Committee are glad to be able to bring cust, having not less than 1000 trees. The vellow Farmers ought, in duty, to make the trial for locust, (Robinia pseudo acacia,) is the common themselves. They generally have much land, locust of our country, and well known to every-

grope, where, as the late learned Professor Peck, is said, 'this insect does not exist.' It was cultipod. It was esteemed for quickness of growth, beauty as an ornamental tree, and its aptitude perpetuate itself by its roots, which run near icle of fuel, as much so as walnut. At the preit time, nothing but the worm prevents our holdthe locust in the same estimation our ancess did, and shall this discourage us so much as only to prevent our planting, but incline us to irpate the few trees that remain? Rather let encourage the tree and endeavor to extirnate worm. This would be a much wiser as well a more manly course.—There are parts of the intry, the more southern parts, it is said, where s insect does not abound, or is not known and y may we not hope, ere long, to be freed from At worst, the locust will do for fire-wood, ugh hable at present to be blown down before ttains much size, and for this purpose alone, sidering that our forests are disappearing, -it is I worthy of public attention. Bad as the case is nay be much doubted, whether, as it can be so ily done, so good a use can be made of our vel knolls and barren spots as to plant them wh the yellow locust.

he Trustees of the Massachusetts Agricultural Society. TENTLEMEN-I have been induced by the prenim offered by you, to plant out an acre of Yel-Locust trees. In the spring of 1828, I proed at the seed store of Mr Russell, in Boston, a utity of seed, and poured into it boiling water, suffered it to soak therein three or four days. en I sowed it in the garden, and carefully weedhe plants; many of them grew to the height our and a half feet that season. In the spring wing I transplanted them on to about two thirds in acre of poor, worn-out land, placing them ows S feet apart, and at 4 feet distance in the s. On one side of this plat in 1829, I sowed e seed, with the view of making a hedge fence i them, and of supplying more trees to make the acre. I have this season covered over an with the trees of the two seasons, and there more than 1000 trees on the acre. On two ds of this acre, therefore, the trees are now of the years' growth-on the other third, of two rs' growth. On the best of the land some of trees are four and a half inches in circumfere, and seven feet high. I chose a poor soil the trees that they might enrich it.

notice that wherever Yellow Locust trees grow grass under them is not only much increased mantity, but that the caule eat it in preference ther grass-always biting it close to the ground. erefore prefer it for hedges to any other live wth-for, so far from injuring our pastures, y are a positive benefit to them.

Respectfully yours, WILLIAM BUCKMINSTER, Framingham, Nov. 15th, 1830.

ly weighing 1826 pounds,

OBSERVATIONS ON THE TEETH.

An object very subservient to health, and which ted in old times for various reasons. Planted on merits due attention, is the preservation of the avelly and sterile lands, where it grows freely, it teeth; the care of which, considering their imas found greatly to fertilize the ground. It was portance in preparing the food for digestion, is, in nsidered valuable for its great durability when general, far from being sufficiently cultivated. ed for posts and as timber. It was used for Very few persons, comparatively wash their mouth e nails in ship-building, not only for its strength in the morning, which ought always to be pracd durability, but from its not shrinking like other tised at the conclusion of every meal, where either animal food or vegetables are eaten; for the former is ant to leave behind it a rancid acrimony. and the latter an acidity, both of them hartful to surface of the ground,—and if wanted for no the teeth. Washing the mouth frequently with her purpose, could be used as a most pleasant cold water, is not only serviceable in keeping the teeth clean, but it strengthens the gums, the firm mel, or of separating the teeth .- Jour, of Health. adhesion of which to the teeth, is of great importance in preserving them sound and secure,

Picking the Teeth-Picking teeth properly is also greatly conducive to their preservation; but the usual manner of doing this is by no means favorable to the purpose. When it is necessary to pick the teeth, the operation ought to be performed with due care, so as not to hurt the gums; but the safest and best way of doing it is always before a looking-glass,

Tooth Powder, -- Many persons, while laudably attentive to the preservation of their teeth, do them burt by too much officiousness. They daily apply to them some dentifrice powder, which they rub so hard as not only to injure the enamel by excessive friction, but to hurt the gums even more than by the abuse of the picktooth.-The quality of some dentifrice powder, advertised in newspapers, is extremely suspicious; and there is reason to think that they are not altogether free from a corrosive ingredient .- One of the safest and best compositions for the purpose, is a mixture of two parts of oystershell, and one of Peruvian bark, both finely powdered; which is calculated not only to clean the teeth without hurting them, but to preserve the firmness of the gums,

Beside the advantage of sound teeth from their use in mastication, a proper attention to their treatment conduces not a little to the sweetness of the breath. This is, indeed, often effected by other causes, existing in the lungs, the stomach, and sometimes in the bowels; but a rot-

sequence of the mouth, or part of the food remaining too long about them. The most frequent cause of foul teeth is the substance called tartar, which seems to be a deposition from the saliva, and with which the teeth are often almost entirely incrusted. When this substance is allowed to which the mouth is to be washed with common

The teeth are sometimes covered over with a thin dark colored scurf, which has by some been mistaken for a wasting of the enamel, but which is only an extraneous matter covering it. By perseverance this may be cleaned off as completely as when teeth are covered with tartar; but it is apt after some time to appear again. When it is observed, the same operation must be repeated,

For the purpose of applying powders or washes to the teeth, a brush or a sponge is commonly employed; the latter is supposed preferable, as being in least danger of wearing down the ena-

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, MARCH 30, 1831.

POULTRY.

Continued from page 278.

Feeding and fattening Fowls .- Fowls will become fat on the common run of the farm-yard where they thrive on the offals of the stable, and other refuse, with perhaps some small regular daily feeds; but at threshing time they become particularly fat, and are thence styled barn-door fowis, probably the most delicate and highly flavored of all others, both from their full allowance of the finest grain, and the constant health in which they are kept by living in a natural state, and having the full enjoyment of air and exercise. It is a common practice with some housewives to coop their barn door fowls for a week or two, under the notion of improving them for the table, and increasing their fatness; a practice, however, which seldom succeeds, since the fowls generally pine for their loss of liberty, slighting their food, lose instead of gaining additional flesh, the period being too short for them to become accustomed to confinement.

Sandy gravel and a little lime rubbish should be placed where they can be accessible at all times to fowls, and often changed. Small bits of charcoal, it is also said, will be swallowed by poultry, and prove beneficial to them. A sufficient number of troughs, for both water and food should be ten state of the teeth, both from the putrid smell placed around, that the stock may feed with as emitted by carious bones, and the impurities lodged little interruption as possible from each other, and in their cavities, never fails of aggravating an perches for roosting on in the same proportion unpleasant breath wherever there is a tendency of should be furnished for those birds, which are inclined to roost aloft, which few of them will de-Foul Teeth.—The teeth sometimes become yel- sire after they have begun to fatten, but which low or black without any adventitions matter helps to keep them easy and contented till that being observed on them; at other times they he- period. By this mode fowls may be fattened to come foul, and give a taint to the breath, in con- the highest pitch, and yet preserved in a healthy state, their flesh being equal in quality to that of the barn-door fowl.

The privation of light, by inclining fowls to a constant state of repose, excepting when moved by the appetite for food, promotes and quickens their fattening; but a state of obesity, obtained in remain, it insinuates itself between the gums and this way cannot be a state of health; nor can the the teeth, and then gets down upon the jaw in flesh of animals so fed, equal in flavor, nutriment, such a manner as to loosen the teeth. This, in- and salubrity that of the same species fed in a deed is by far the most common cause of loose more natural way. Economy and market interteeth; and when they have been long covered est may, perhaps, he best answered by the plan of with this or any other matter, it is seldom they darkness and close confinement, but a feeder for can be cleaned without the assistance of justru- his own table, of delicate taste and ambitious of ments. But when once they are cleaned, they furnishing his board with the choicest and most Large Ox .- An Ox six years old, belonging to may generally be kept so, by rubbing them with salubrious viands, will declare for the natural mode us Lothrop, Esq. of Easton, was slaughtered a thin piece of soft wood made into a kind of of feeding; and in that view a feeding yard gravbrush and dipped into disilled vinegar; after elled and turfed, the room being open all day, for

them, to make the best of them, it being extremely line, sweet apples, or any other sweet vegetable difficult, and often impossible to fatten long legged substances with potatoes for food for poultry which fowls in coops, which however may be brought to it is wished to fatten. a good weight at the barn-door,

In the choice of full sized fowls for feeding, the short legged and early batched, always deserve a preference. Where a steady and regular profit is required from poultry, the best method, whether for domestic use or sale is constant bit h keep from the beginning, whence they will not only be always ready for the table with very little extra attention, Lat their flesh will be superior in nutrimem and favor to those which are fattened from a low and litive fermation, do not contain all the ingredients made for grinding them should be constructed. emaciated state. Fed in this mode, the spring pullets are perticularly fine, and at the same time mest nomishing and restorative food. The pullets which have been hatched in March, if high fed from the nest, will lay plentifully through the following autumn, and not being intended for breeding stock, the advantage of their eggs may be taken, and the fowls disposed of, thoroughly fat for the table in February, about which period their laying will be finished. Instead of giving ordinary corn [grain] to fattening and breeding poultry, it will be found most advantageous to allow the beaviest and best, putting the confined fowls on a level with those fed at the barn-door. It grows best on rich new lands, or on a soil where they have their share of the weightiest and faces; corn. This high feeding shows itself not only in the size and flesh of the fowls, but in the size, weight and substantial goodness of their eggs. which in those valuable particulars will prove far superior to the eggs of fowls red upon ordinary earn or washy potatoes; two leags of the former going furt'er in demestic use than three of the I cler. The water also given to fattening fowlshould be often renewed, firsh and clean; indeed requires a good loamy soil not too light nor too The New England farmer can adopt the Flems! those which have been well kept with our with disgust from ordinary feed and foul water,

Barley and wheat are the great dependence for chicken poultry; cats will do for full grown hens and cocks, but are not so good as barley; both, introduction of turnips and clover, all soils but when they have their fill of corn will cat occa- lattle cohesive were thought quite unfit for wheat; with the urine and carbonaccous liquids of the vard sionally cabbage or beet leavis. the lowls to retire at pleasure, will have a decided is very useful to mix with the food of poultry,

To be continued

FARMERS' WORK FOR APRIL, SPRING WHEAT.

It has been a generally received opinion that wheat cannot be cubivated to advantage in New England; but with proper management good crops have been and doubtless may be obtained. It is said that the soils of New England, being of primare allowed by all agriculturists to be animal matter and lime. The former has a direct influence in supplying that essential constituent to wheaten flour, gluten; and the latter azote and lime, both netually found in the straw of wheat. At all events it is certain that wheat will not thrive on any soil which does not contain lime. In this Sir H. Davy, Chaptal, Professor Theor and Gris- abounds in animal matter; and this must be the enthwaite fully agree.

Spring wheat should be sowed as early in the season as the soil can be fitted for its reception. which has been well manured for the crops, which immediately preceded the proposed wheat erop, It is apt to be injured by the growth of grass and weeds, and should, therefore follow potatoes or some other heed crop; or it may follow peas, or a clover lay, if the land is free from weeds. Dr Deane observed that wheat sown in the spring should be only covered with the harrow, as it has no time to lose and ought to be up early. Wheat the cask, and extending horizontally and parallel beavy. An English writer says, the soils best adapted to wheat are rich clays and heavy leams; but these are not by any means, the only descriptions of soils on which it is cultivated. Before the

Field, Grass, Garden, Herband Flower Seeds, to be found in New England, of the very first quality, and at fair prices, wholesale and retail.

Also, Fruit and Forest Trees, Grape Vines, (of both native and European origin,) and Ornamental Shrubs at Nurserymen's prices. March 2.

Silk-Silk.

The Subscriber, of Luffrey, Cheshire county, New Hampshire, has two or three thousand White Mulberry Trees of three years' growth, in fine order for transplanting the present Spring, which he will dispose of on reasonable terms. Inquire of I-AAC PARKER, 74 Water street, Boston, or the subscriber. Jaffrey, March 15, 1831. ASA PARKER.

20,000 White Mulberry Trees.

Orders received by the subscribers for the above Trees, to be delivered in the month of April: they are from one to three years old, of the first quality, and will be sold on reasonable terms. GREGG & HOLLIS,

-Dealers in Medicine, Paints, Oil, Window Glass. &c.-No. 3) Union street, Boston. March 16.

Grape Vines.

The subcriber offers for sale, several hundred Grape Vines of one and two years growth, and uncommonly healthy and thrifty. They have been raised with great care from Vines which have been forty years in this elimate, and are of the kind which obtained the premium bage; it is thought that no plant cultivated in this of the Horticultural Society the last season. Also, a few Isabella, and several other varieties. Orders for any and, for Milch Cows, as this. It has been successfully number of Vines left with Mr J. B. Russell, at 52, North wivated to a large extent in New England and the Mid-Market street, Boston, or with the sub-criber at Charles-DAVID FÖSDICK.

Charlestown, March 23, 1831.

Gardener Wanted.

Apply to ZEBEDEE COOK, Jr. No. 71 Exchange

Notice to the Public.

WILLIAM PRINCE & SONS, Proprietors of the Lax-

NIEAN BOTANIC GARDIN AND NORSERIES BEAR New York, have to announce, tha every invoice of Trees, &e, sentr from their E-tablishment, eithe direct or throng i by a printed heading, and have The their signature, and that they take

upon themselves no responsibility, unless such bils from them can be produced, and they therefore wish their entomers in every part of the Union to be tenucious on this head. The accuracy of every article sold by them is expressly guaranteed; and as many persons in the Unite I States are Agents for various Nurseries, they request that orders intended for them may be particularly designated, and that the bill as above be required as proof of their execution. Orders sent direct per mail, or through Mr J. B. Russell, Eoston, or any other Agent, will receive prompt attention. March 26.

Agricultural Seeds.

For sale at the New England Seed Store, 52, North Market street, Boston,

Spring Rye; Millet; two-rowed Barley; Gilman Spring Wheat; Perkins' Early Seedling Potatoes, (that took the premium from the Massachusetts Forticultural Society); Burnham's Premium Potatoes, (that have twice taken the premium from the Essex Agricultural Society, as the best stock potatoes raised in the county); Early Manly Potatoes, (originally from Europe); Grass Seeds of all kinds, &c .- ill of the very first quality.

ASPARAGES ROOTS.

Several thousand plants of the Large Early Devonshire Asparagus, 3 years old, price 75 cts per hundred, well packed in moss, in boxes of one, two, and three hundred roots each.

GOOSEBERRY BUSHES, &c. Also, large Scotch Gooseberry Bushes, just received from Greenock .- Large White and Red CUR-RANT BUSHES, &c.

Also, Catawba, Isabella, White Sweetwater, Black Hamburgh, and other kinds of Grapes, well packed in moss, so as to bear transportation hundreds of miles with safety-price 50 cts each. Large Tart Rhubarb Roots, March 26.

BRIGHTON MARKET-Monday, March 28. [Reported for the Chronicle and Patriot.]

At market this day, 524 Beef Cattle, 37 pair Working Oyen, 10 Cows and Calves, 198 Sheep and 1025 Swine; 200 Beef Cattle, all of which are good and many of them equal to any at market remain unsold; also, quite a numher of yokes working Oxen, exclusive of some driven in from the immediate neighborhood and back again at night.

PRICES .- Beef Cattle-The market today was much gluited and sales very unequal, we have not noticed the like since Sept. last; several of the drovers were firm at something like last week's prices, some did not sell an ox. others but a small part of their drove, while on the other hand several lots were sold at astonishingly low pricesconsiderably below our quotations. We shall quote from 4 25 to 5 25; a few prime Cattle, say about 20, were taken at \$5.50.

Working Oven-More were at market today than we can recollect of ever seeing in one day at this season of the year; several exchanges were made; also sales and prices not disclosed, we noticed as follows; \$45, 58, 65, 2, 75 and SS7 50.

Coms and Calves .- Sales 17, 19, 23 and 25.

Sheep .- We noticed one lot of 60 prime, sold at \$5,50 a 4,5); price not ascertained for the other lot.

Swine .- Considerable doing; the medium price for selected lots 41 for Sows and 51 for Barrows; some small selected lots of Barrows at Se; also, one or two lots of large do, at die; also, a small lot large and coarse at 3e; retail, fair, at 5c for Sows and 6 for Barrows.

New York Cattle Market, March 21.-At market 450 head of Beef Cattle and about 190 Sheep. The demand for Beef not so good as heretofore, 1st quality 7,50 a 85; good 63 a 7, fair 6 a 64. Sheep, 1st qual. 64 a 7, good 55 a 6; fair 4 a 5. One small lot wethers, without the fleece \$4 cach; one lot of beautiful Sheep from Philad. at 12½c, per lb. quarters weighing 130 to 150 lbs. Mileh Cows, market is full and sales dull, 25 a 30 and \$35 each; first quality will bring \$40.

MISCELLANY.

From Hood's Comic Annual for 1831.

I'M NOT A SINGLE MAN.

Well, I confess, I did not guess A simple marriage vow

Would make me find all womenkind Such unkind women now!

They need not, sure, as distant be

As Java or Japan,-Yet ev'ty Miss reminds me this-I'm not a single man!

One used to stitch a collar then, Another hemmed a frill;

I had more purses netted then Than I could hope to fill.

I once could get a button on, But now 1 never can,-

My buttons then were bachclor's-I'm not a single man!

Ah me, how strange it is the change, In parlor and in hall,

They treat me so, if I but go

To make a morning call, Il they had hair in papers once,

Bolt up the stairs they ran; They now sit still in dishabille-

I'm not a single man!

Miss Mary Bond was once so fond Of Romans and of Greeks, She daily sought my Cabinet,

To study my antiques.

Well, now she doesn't care a dump For ancient pot or pan;

Her taste at once is modernized-I'm not a single man!

Go where I will, I but intrude, I'm left in crowded rooms, Like Zimmerman on Solitude,

Or Hervey at his Tombs.

From head to heel they make me feel, Of quite another clan;

Compeil'd to own though left alone, I'm not a single man!

"Tis hard to see how others fare, Whilst I rejected stand,-Will no one take my arm because

They cannot have my hand?

Miss Parry, that for some would go A trip to Hindostan,

With me don't care to mount a stair -I'm not a single man!

Some change, of course, should be in force, But, surely not so much-

There may be hands I may not squeez But must I never touch?

Must I forbear to hand a chair, And not pick up a fan?

But I have been myself pick'd up-I'm not a single man!

Others may hint a lady's tint Is purest red and white-May say her eyes are like the skies.

So very blue and bright,-I must not say that she has eyes,

Or if I so began,

I have my fears about my ears,-I'm not a single man!

General Rapp's Fidelity .- On the day when the news of the decease of the ex-Emperor reached the Tuileries, Louis XVIII. was surrounded by a brilliant Court, all of whom, with the exception of one man, received the intelligence with the most unequivocal signs of delight. This man was General Rapp, who burst into tears. The king perceived and noticed it. 'Yes, Sire,' answered the General, 'I do weep for Napoleon; and you will excuse it, for to him I owe everything in the world, even the honor of now serving your Majesty, since it was he that made me what I am.' The king, in an elevated tone of voice, replied, 'General, I do but esteem you the more. A fidelity which thus survives misfortune, proves to me how securely I may depend on you myself,'

In the Rutland Herald is a story that a 'Bay State Yankee' snuggled a lot of goods from Canada, safely, by driving by the Custom House at full speed, at night, and when chased by the officer, after going two miles, turning and meeting him. The officer asked if he had seen a man with a load of goods; he replied he had, half a mile behind him; and when the officer was going one way, the sninggler turned upon another road, and journeyed at his ease.

An Ancient Feoffment.-There is a singular historical fact connected with Sutton, in Bedfordshire. The valuable manors, advowsons, etc, etc, etc, of Sutton, and the contiguous and populous parish (Potton) were conveyed by a deed of gift to Sir Roger Burgoyne, by the famous John of Gaunt, Duke of Lancaster, as a reward for the valor of that warlike knight: and the extensive and valuable domain has, notwithstanding many intervening revolutions, remained vested in 'the heirs of his loin' down to the present day. The deed of conveyance was made in the following laconic manner:

> I, John of Gaunt, Do give and grant, Unto Roger Burgoyne, And the heirs of his loin, Both Sutton and Potton. Until the world's rotten.

EYRON'S EPIGRAMS.

'One,' he says, 'I wrote for the endorsement of the "Deed of Separation" in 1816; but the lawyers objected to it as superfluous. It was written as we | Esq. on the town. were getting up the signing and sealing. *** has the original.

Endorsement to the Deed of Separation in the April of 1816.

A year ago you swore, fond she! 'To love, to honor,' and so forth: Such was the vow you pledged to me And here's exactly what 'tis worth.

For the anniversary of January 2, 1821, I have a small grateful anticipation, which, in case of accident, I add-

To Penelope, January 2d, 1821. This day, of all our days, has done The worst for me and you; 'T is just six years since we were one, And five since we were two.

An ladignity.—A medical man who has just returned from setting the broken leg of an Arab, gave the following anecdote: -- 'The patient,' said the doctor, 'complained more of the accident which had befallen him than I thought becoming one of his tribe. This I remarked to him, and his answer was traly amusing. "Do not think, doctor, I should have uttered one word of complaint if my own high bred colt, in a playful kick, had broke both my legs; but to have a hone broken by a brote of a jackass, is too bad, and I will complain." "-Sketches of Persia.

The wrong Leg.—Dr Thomas (Bishop of Salisbury) forgot the day he was to be married, and was surprised at his servants bringing him a new dress. A gnat stinging him in the leg, the doctor stooped and scratched the leg of a gentleman who stood next Farm for Sale.

A fine opportunity to any person wishing to make imof one of the best Farms for this purpose in the State; sit uated 9 miles from this city. A large part of the land; alluvial soil, may be easily kept drained, and made ex ceedingly productive. A further description may be see: at this office. 31 March 16.

Valuable and Cheap Land-for Sale.

The subscriber offers for sale, 14,000 acres of choice and state of New York. Some of the land is improve and under cultivation. The country is remarkally heal tan, being entirely free from the lever and ague and from the common bilious fevers which often afflict the town upon Lake Ontario, this town being 18 miles cast of the lake. The soil is principally a sandy loam, much of i covered with rich black mould. The timber is chiefly Sugar Maple, Black Ash, Butternut, Beech, Elm, &c The land yields first rate crops of Grass, Rye, Oats, Par ley. Potatoes and Flax; and on some lots, good Whea and Corn may be grown. To those wishing to obtain su perior grazing farms, a fine opportunity now offers itself The produce of pasturage and hay from an acre of this land, is very large, fully equalling if not surpassing tha from the same quantity of land in any other of the Black River townships. The land is admirably well watered there being out few lots which have not durable running streams upon them. The land is well adapted to Orchard ing-the Apple tice thriving very well in this county Stock of all kinds may be disposed of with the least possible trouble, and to the greatest advantage, the droven purchasing at the very doors of the farmers, and paying the highest cash prices for their cattle, which will readily find purchasers at all seasons of the year. Several farmers at present residing on this town, were originally from the New England States, and some of them from Massachusetts, who are in thriving circumstances. The above described land is offered for sale at the very low price of from two dollars and a half to three dollars per acre, for the uncleared land, and from three dollars and a half to five dollars and a half for the improved lots. The land will be sold in lots to suit purchasers, and from two to five years' credit for payment, in annual instalments. will be given. As a further convenience to purchasers. the subscriber will receive in payment, Cattle, Sheep Perk, Grain or Grass Seed, for which products he will allow the highest cash prices. The title to the land is indisputable, and good Warranty Deeds will be given a purchasers. Persons desirous of purchasing will please to apply to the subscriber, at Henderson Harbor, county of Jefferson, State of New York, or to DAVID CANFIELD JAMES H. HENDERSON. March 9. ep16t

MORTICVETURE.

FOR THE NEW ENGLAND FARMER,

MR FESSENDEN-In the September number, of Annales de L'Institut de Fromont, is a very eresting lecture on fruit trees, by Professor teau, a translation of which I inclose. It is the teenth of his course on horticulture, in that adable school, where are assembled, peoils from parts of France, to receive theoretical and prac-Il instruction, in every department of garden-

You will observe, that of the five works on t trees, which he recommends to his students, have enriched our library with two of the most table. Duhamel's Traite des Arbres Fruitiers Thouin's Cours de Culture, The first is not v the very best, but the most superb work ever lished on Fruit Trees, In Europe it is conred indispensable in the libraries of all instions, which have been founded for the diffusion ntelligence in the various branches of rural nomy; and every gentleman, who has a taste useful or ornamental planting, and is able to that splendid monument of Pemona, is amous to make the acquisition. As it is expen-. costing in Paris about two hundred and fifty urs, but few copies have reached his country. ow of only two others, besides that which we ived last autumn. It is itself a fait library; a learned, and magnificent publication as s lustre to a nation and establishes at epoch s history.

he Manuel Complet du Jardinier by M. L. Noi-, the Cours theorique et Practique de la taille Arbres fruitiers by Dalbret, and the Pomone ecaise, by the Comte Lelieur, would render collection of French publications, on fruit as, quite perfect, and I hope we shall obtain before next autuum,

Very respectfully,

Your most obedient servant, H. A. S. DEARBORN.

inley Place, th 28, 1830.

EXTRACT NO. XXXIII.

m the Annales L'Institut Royale Horticole de Fromont. HERAL AND HISTORICAL REMARKS ON FRUIT TREES.

BY PROFESSOR POITE AU.

Iom considerations on the structure, power use of our organs, and reflections on the and gradual progress of the human mind. sophers and naturalists have, for a long time. induced to think, that the primitive race of had no other nourishment, than the simple , which nature presented; and that their study was directed, to the amelioration and plication of those, which were the most

is opinion, so universally entertained, and to in no one can urge an objection, places the Bre of fruit trees, not only at the head of all Pres, but of all human inventions. This culr it is true, must have been very imperfect durgiany ages, for, probably, the cradle of the hufortunate inhabitants of the tropics.

Whether the earth has grown colder in those portions the least exposed to the influence of the sun, or that a too numerous population has flowed. back from the equator towards the poles, it is at least certain, that it was the inhabitants of those climates, which are deprived of sufficient heat, who first attempted to ameliorate the indifferent or bad fruits, which their soil produced, and to introduce others, which had been ameliorated, or were naturally good. Why, indeed, should the people, who live near the tropics, trouble themselves to obt un by culture, those products of the earth which nature herself lavishes upon them? Does she not offer, in profusion, Bananas, Guyavas, Sapota-Pluns, Custard Apples, the fruits of the Palms, those of the Bread tree and several others, which have sufficed, and will for a long time suffice to support the inhabitants of those fortunate regions? But it was not the same, with the man who lived in the temperate and cold climates; the earth yielded him nothing without great labor, and whenever he invaded her vast domains, she seemed to reproach him, like a step mother, as if it had not been his country.

Wearied by the rigors of nature, it was then that the man of the temperate climate began to develope his august character, and to distinguish himself from the brute, with whom he had coutended for his prey; his genius soared, his conceptions were enlarged, his ideas multiplied and he combined them; phenomena, which he had never observed, attracted attention; he drew conclusions from some, conjectured others, and attempted to imitate them. Soon, becoming master of the secrets of nature, he caused the pear tree to divest itself of thorns and to change the hard and acrid substance of its fruit, into a rich and succulent pulp : he gave the sweetness of honey to the biting acid of grapes, and to the disagreeable sourness of the cherry; almonds lost their bitterness; hard, juiceless and tart peaches, were metamorphosed into delicious fruit, which charmed the senses of vision. taste and smell; finally, man impressed the seal of his power upon all objects which surrounded him, not only making them administer to his wants and his pleasures, but changing their habits, their forms and their natural characters.

All these wonders could only be effected in a temperate climate; that is to say, in one, not sufficiently warm, for nature to produce spontaneously, all that is necessary, for the support of man, nor so cold, as to prevent the complete development of all his physical and intellectual faculties,

Indeed, the inhabitant of the tropics, yielding to the sole imperious wants of nature,-to live and reproduce, has never invoked the assistance of genius, nor of that extensive power of ratiocination, which it demands; but he has continued to to encourage the people, and to direct their attenvegetate in a state, but little elevated above the tion, to the practice of that art; and they did not brute, because he is wanting in that stimulant, so disdain to trace, with their own hand, its precepts necessary for the development of his intelligence. and its laws. Were not the greatest men of Rome, On the other hand, the inhabitant of the frigid alternately, cultivators of the soil and warriors? zones, discouraged by nature, is indeed very sensible of his numerous wants, but the austerity of fields that they were sought, to be placed at the are was under the torrid zone, where nature his climate is constantly opposed to a full develop- head of armies, to be elevated as Consuls, or

lavished her treasures, as she still does, to the ment of his organs; and with imperfect organs, he cannot act or think, but in an imperfect manner.

The inhabitant of the temperate zones, who is as well organized as those of the tropies, contains within himself the germ of genius, and of all the intellectual faculties; but the earth only presents him acorns, brambles and thorns. Nevertheless, obliged to procure the means of subsistence, he construtty directs his attention towards those objects, which can satisfy his hunger, and labors with his hands, to execute whatever his reason had suggested. These various operations enlarge his memory, favorable and unfortunate experiments are recollected, and he learns to do better. He assertains what fruits are preferable; he gives them his exclusive attention, and has the pleasure of seeing them ameliorate under his fostering cares. Such discoveries, after the experience of several generations, enlighten his mind, and give him the first idea of the dignity of his character, and reveal to him the fact, that he alone, can rival na-

So long as cultivation was in its infancy, the good fruits, which it had produced, existed no longer than the original trees which bore them, after the death of which, they disappeared forever; for although the origin of the art of budding, grafting, and the propagation by layers, is lost in the highest antiquity, it is certain, that fruit trees had long been cultivated, before an attempt was made to cause one of their branches to take root, and a st longer time before nature was imitated in the peration of grating by approach,-the only kind of grafting of which she has given us an example. But it is most true that the period is very distant, when some parts of culture and of vegetable physiology had been carried to a certain point of perfection, for the art of budding has been known, at least, since the age of Hesiod, or for nearly three thousand years. This mode of grafting is not an imitation of nature, but the result of reason. Now he, who knew how to reason so far, as to obtain by budding, the same result, as from grafting by approach, must have been as well acquainted with vegetable physiology as we are, er as those who have preceded us, during the last thirty centuries.

Besides, it is not astonishing, that in very distant ages, the culture of fruit trees, and of cereal plants, should have been carried to a very high degree of perfection; for they have, during all time, been the source of real wealth, and the most legitimate means of prosperity; they afford salutary exercise, and infinitely varied pleasures, which very far from being injurious to the constitution, like many others, they embellish the career, and fill up the leisure hours of life.

Even after the mind of man had directed his tastes towards other objects, in the acquisition of riches, wise kings, and enlightened princes, ever convinced of the value of agriculture, ceased not proclaimed as Dictators; and when these demi-embellished his dwelling, charmed his leisure hours, husbandry.

Still, the false and haughty pride, of the imabitants of cities, induced them to regard agriculture, received from him, in their infancy. as a low occupation, and unworthy of a man of merit; of the earth is the most difficult of the arts, that discoveries, of learned theories and of fortunate devoted his labors for the public good, and but fee economy. It is to this false pride, which is most all charm, which induces us to love trees, the in-assuredly attributable, the mutual contempt that numerable pleasures which they afford, and the de-he rendered to agriculture, horticulture, the art of the earth as the most essential class of the cmpire.

Like all branches of human knowledge, agriculture has gained, but more often lost by the revolutions of nations: according to circumstances, one branch of culture has been proscribed and another encouraged. Thus during the disastrous years of the revolution of 1789, it was, if not more useful, at least more safe, for the tranquillity of the cultivator, to cover his land with potatoes, than to enrich it, with new foreign plants; consection of the last, in which render this edition as complete as possible, not or quently, almost all the nursery-men of Vitry, were art is the more perfect in proportion as it approxi- by as respects the science which has much advanobliged to destroy their young plantations of trees mates to nature. It is a task which the director ced since the time of Duhamel, but in the perand shrubs, and devote themselves to other branch- of the Institut Horticole has reserved to himself, fection of the engravings, and we venture to be es of industry. If at some future period, you may sire to see a large number of fruits, sufficiently ell delineated, you will examine the Traite des rbres Fruitiers, which M. Turpin and myself have blished.

FOR THE NEW ENGLAND FARMER.

REES.

MR EDITOR-A writer in your last paper over e signature of 'A Countryman' makes several quiries about Bees and Beeshives. Although I n unable to answer his inquiries positively, yet hat little I have experienced in the management bees, may be of some use to him and other ovices' (as he calls himself) in the business.

Having been much troubled with the bee moth the old fashioned hives in the spring of 1829, I put swarm into a hive made exactly from the descripon of Mrs Griffith's hive in Thacher's Treatise, ge 95. As the dimensions there given make large hive, and the season was unfavorable for oney they did not quite fill the hive, and were t into the box. The last season, I put two varms more into the same kind of hive. The ason proving favorable, about the first of Auist, I opened the holes in the three hives and t the bees pass up into the bexes. After y bees had done collecting honey in the fall, took off the boxes, and had sixty pounds of ire honey and white comb in the three, entirely ee from bee bread, young bees, or any other ixture. This being good toll, and not being le by the most careful examination to discover y appearance of moths at any time in hives of at construction, I am very decided in favor of rs Griffith's hive. Some time in April, I lowered e bottom of the hive about half an inch, and pt it open until cold weather in the fall, expt some cold stormy weather. This gave e bees a free passage on all except the hinge

Now whether 'the first made honey is free from e bread and young bees,' I do not know, but I do tow that my honey from the boxes was; and as e bee bread and young bees must be somewhere, suppose it and they might be found among e first made honey, or rather in the first made imb. And whether all or any of the numerous ans for an Apiary, will prevent the moth from struding, I am not able to say; but I believe that ie smoothness of the inside of Mrs Griffith's hive, ad the shape of the lower part are a sufficient curity against their depredatious,

I am somewhat sceptical as to the various neories men have adopted respecting the governient, laws, &c, of bees; more especially as allost every writer I have read has a scheme of is own, and condemns all others. I have atempted, by glass in the hives with a shutter, to ee them at work, but with little success. They ave generally, with me, covered the inside of the lass with something to prevent my seeing. One bing is certain, whoever undertakes to pry into heir concerns too closely, will soon to his cost earn, that they are capable of turning his attenion from themselves to his own bodily feelings;

at the others are but extracts, or compilations, will be known that they are governed by a queen, ore likely to mislead, than to direct you, properly, whether their form of government is a monarchy, John B. Turner.

Scituate, March 26th, 1831.

WILD RICE.

Mr Russell-In your paper of 16th inst. some inquiry is made relative to the Canadian or Wild Rice (Zizania aquatica) called also Folle avoine, and Menomene. I send you berewith a package of this seed. It was given to me by my friend Mr James Ronaldson, of Philadelphia, who procured it from the Menomene Indians, now, or lately, at Washington. They stated to Mr R, that it grows always on muddy bottoms of rivers or ponds, where the water is shallow and does not run rapid. I find that the seed is much larger than the Zizania miliacea which is abundant in this neighborhood, and grows in similar situations,-and which fattens our ' Reed or Rice birds' (Emberiza oryzivora) until they equal or excel the famous Ortolans of Europe. Yours, truly, R. CARR.

Bartram Bot. Gar. March 27, 1831.

The seed of the Wild Rice described above, is received. In order to carry Col. Carr's patriotic intentions into effect, we shall distribute it among such of the subscribers of the New England Farmer as will apply for it. As the quantity of seed is necessarily small, and we wish to give it as wide a diffusion as possible, applicants must be modest in their expectations.

MAJ. LONG'S GRAPE.

MR FESSENDEN-In your number of the 9th of March, a writer over the signature M, inquires whether the Grape mentioned by Major Long, in his Journal of the Expedition to the Rocky Mountain, has yet been introduced or cultivated by any one.' I have the pleasure of informing you, Sir, that I have a number of plants growing from the seeds of these grapes, which were brought for me, by my consin, Dr Thomas Say, who accompanied Major Long on this expedition. They have not yet borne fruit, but it is very probable that they will produce some this year,-when I shall have the pleasure of forwarding you a sainple of them.

Very respectfully,

I remain your obedient servant.

ROBERT CARR.

Bartram Botanic Garden,) Philadelphia, March 26.

BREEDS OF CATTLE.

MR FESSENDEN-'A Rustic and the public generally' are advised not to receive as good authority the communication from Colonus.

"A Rustic' for the information he wishes is referred to the different and many able communication and reports of Committees of different Agricultural societies, published in the New England Farmer, from the 1st to the 9th volume, upon Cattle and Cows.

QUERIES.

and I very much doubt whether it is now, or ever correspondents have the goodness to inform me Taunton Sun,

through the New England Farmer, the most effectnal way to exterminate from our soil, that dreadful stuff usually called twitchgrass—also what kind of a plaster is most suitable to apply to the wounds of apple trees caused by pruning.

A Subscriber. Hampton Falls, N. H. March 28, 1831.

From the Genesee Farmer.

CARROTS.

Messrs Editors-In Number 6 of your paper, I noticed an article on Carrots, in which that vegetable is strongly recommended as a cheap, wholesome, and invigorating food for horses, &c. Now, sirs, although I am neither an Agriculturist nor Horticulturist, and not much of a Horse-ologist, yet having, as I conceive, thoroughly tested the properties of carrots, as an article of food for horses, I leg leave to communicate the result of that test through the medium of your interesting Journal.

In the summer of 1829, I became possessed of two horses, that were so lean and ungainly in their appearance, that they would have caused Rozinante, to blush for the degeneracy of his race. A heighbor of mine advised me to feed them on carrots: I did so -and their rapid regeneration equalled my most sanguine expectation. I continued this diet until they were in what is called good order, when having occasion to travel about four hundred miles, I resolved to ride one of the horses and have the other put to work. Before I got to my journey's end, however, I found that the horse on which I rode was losing flesh faster than he before had gained it, for which I was at a loss to assign any adequate reason; I finally concluded. however, that he was unwell. Having with much difficulty rode him home, I was surprised to find the horse which had been worked, poorer, if possible, than the 'bonny steed' which I bestrodethe former having been fed entirely on carrots. I communicated the circumstance to a gentleman in the neighborhood, who had been a drover for a number of years, thinking that he might probably 'account for the phenomena. From him I learned, that whenever he became possessed of a poor horse, he immediately dieted him on carrots, mixing with them a little oat or corn meal; or else, after fattening them on carrots alone, he always fed them on meal, for two weeks, or more, before driving or working them; because, from the rapidity with which they acquire flesh, when fed on this esculent, their flesh is not solid. This I subsequently found to be the case.

As you truly observe, horses will fatten quicker on carrots than on any other diet, but I would recommend that they should be chopped fine, and mixed with meal, as their flesh, when fattened in this manner, will be much more firm and durable.

Rochester, Feb. 21, 1831.

ANOTHER WARNING TO DRUNKARDS .- On Monday morning last, a man was found in a saw mill in the easterly part of this town, with both legs frozen to the knees, and his arms to the shoulders. It is supposed that in a fit of intoxication he took up his lodgings there on the Saturday night previous, and was unable to get ont on the Sabbath in consequence of the frozen state of his limbs. He was found on Monday morning by the owner of the mill, with a jug of spirits by his side. It is not expected that he will survive, or MR FESSENDEN-Will you or some of your if he does it will be with the loss of his limbs -

REPORTS

MASS. AGRICULTURAL SOCIETY IN 1830.

Continued from page 295.

DESTROYNO BEE MOTH.

10. Mr John Stone, of Sudbury, in Muldlesex, has made known his method of securing his beehives from the bes-moth. The committee recommend the publication of this statement, considering every hint on this subject as worthy of notice; but as the same in substance has been recommended by others, they do not think it merits the premium.

1, John Stone, of Sudbury, in the county of Middlesex, and Commonwealth of Massachusetts. do testify and say, that I have kept bees, for the term of ten years last past; that for several years my bees were much injured by the beemoth, so called; I lost two hives of bees, which were wholly destroyed by them; every bee was killed and al the honey and comb consumed, and the hive filled with web. In the spring of IS24 or IS25, about the first of April, I raised my hives about 5 of an inch, by putting a small block of that thickness under each corner of the hive; immediately the bees commenced the work of destruction upor the moth-worm, and entirely cleared the hives of them. I have followed the practice ever since and have never received any injury from the becmoth, the worm having been invariably destroyed by the bees, and brought out of the hives. The hives have remained in this situation till the month of October, when I have taken away the blocks and let them down. JOHN STONE.

EXTIRPATING BORER.

II. Mr David Prouty, of Hanover, Plymouth County, has sent a letter to the Trustees, dated Oct. 19, 1830, on the subject of the Apple Borer, which the committee advise to have published with this report. They fear, however, that no effectual remedy has yet been formed to extirpate this most mischievous worm. They invite further attempts to destroy this enemy of our favorite fruit tree.

Respectfully submitted,

P. C. Brooks, Chairman.

To the Trustees of the Massachusetts Agricultural Society.

Gentlemen—The cheapest and most effectual mode of extirpating the Borer that attacks the apple tree, which has come to my knowledge is the application of sharp, coarse gravel, applied as follows: viz. dig off the turf about 4 inches deep, 6 inches to a foot from the tree; spread about half a common cart-load of the afore described gravel, so as to come in close contact with the tree-this article the borer dislikes, and immediately makes his escape; -this has been entirely and completely successful in my orchards for three years past; it may have been tried by others, but I have seen no account of it. I would re- happen that some of the statements should be a quantities, we believe, are greater than are usualcommend a general trial the ensuing year, having little exaggerated, it was thought the evil could by sown, but his crop of grass, nearly two tons to the fullest confidence in its entire success.

Very respectfully.

Your most obedient and humble servant. DANIEL PROUTY.

Hanover, Oct. 19, 1830.

ON THE BEST CULTIVATED FARMS.

examine and consider the claims for premiums for Report.

that this has not happened through any indifference sued the most honorable and useful calling of a ing notice in season to comply with the conditions the successful candidates, prescribed. They are the more confirmed in this

to this object. It was done after much considera- of our country. tion, and a full persuasion that it would prove useful. The only doubt they have over enter-tenant of a farm in Salem, belonging to the heirs tained of its expediency arose, from the district, of the late Col. Pickman, has claimed a premiover which the society extends, being so large that um for this farm. By his statement, which will it would not be practicable for the Trustees, per- be published, it appears that the farm contains sonally, to visit and inspect the farms of the ap-, 428 acres, of which 300 are rocky and broken land plicants. They intended, moreover, by the liberal ble farmers, but to its novelty, and their not receiv- premiums they offered, to bestow a bounty on

These are some of the motives and views which opinion, from finding that one of the applicants influenced the Trustees in establishing premiums states, that he received information that such a for the best cultivated farms; and they still cherpremium was offered, only two days before he ish the expectation that a generous competition made out his statement on the 18th of October, for them in future years, will render them a suc-The public will perceive, that the Trustees have cossful means of conveying practical information appropriated a considerable portion of their income founded on actual experiments, to the agriculturists

Mr E. Ware who for several years past has been

This farm is situate near a market town, Saalso, to derive a considerable profit from apples. He enjoys, moreover, the advantage of purchasmaking it from eelgrass, kelp, and rockweed, To remedy these disadvantages on the part of which he gathers from the beach, and the former, eelgrass, puts into his hogpen and cowyard, and the latter spreads green on his grass land. Bog mud he likewise carts into his barnyard, and mixes with other manure.

> Mr Ware has not given so particular an account of his rotation of crops as could be wished, but as his purpose was to keep as many cows as his farm would support, it is to be presumed he kept his land up no longer than was necessary to subdue, mellow, and renovate it.

His potatoes were principally raised on land of eight or ten cords to the acre, taken from the the cattle, was spread and ploughed under the sod. He states that he has found fresh or long manure for small vegetables, especially tap rooted articles. This, it is believed, is no new or uncommon manure of any kind on his land the year he sows with small grain, that he usually lays it down with successful in taking off a crop of early potatoes in the fall, and sowing grass seed alone upon the land the same year. The crop must be gathered early, to render this advisable. His practice, he says has been to sow a peck and a half of herdsgrass. ed, farmers suffer from being too sparing of their seed.

It is worthy of remark, that it is the opinion of Mr Ware, founded on considerable experience, land lies nearly flat, than where it is drawn the fall with rye, and alone in October after taking around the stalks in a high hill,

one of them is on a model for saving and pre- grass did not get to maturity the next season. ring manure and vegetables for the use of the We are informed that a committee of the Agrit profitable, product of the farm.

, and the great product he has obtained, which oug the tests of skilful husbandry, deserve commendation and entitle him to a premium, ne committee think it also deserving of specstice, that Mr Ware carried on this extensive in the neighborhood of a great market town, out the use of ardent spirits, except for mediurposes. It appears that the laborers were ied freely with family beer, molasses and , and cider with their food, and nothing more. practice the committee consider a saving of ise to the farmer, and health to the laborer; ilthough not very uncommon at this day, on a large scale and highly creditable to the s, and it is hoped will serve to encourage othimitate their example. The committee recand that a premium of \$75 be awarded to are, for the skilful and successful manner ich he has cultivated his farm.

A laim has also been made by Jonathan Allen, of Pittsfield, in the county of Berkshire, for a um for his valuable farm in that town. The ontains 250 acres, and appears to be improvupland, are laid down to grass, for hay; from market, at of the farm is pastured and tilled alter-

en wheat or rye the first year, Indian corn atoes the second, and the third, to lay the flown with oats, or some other spring grain, rdsgrass and clover. His practice is to sow garts of each, but it is to be observed that it asture, if that ought to make any difference quantity. He lays down in this manner ten acres annually.

s and ways of sowing grass seed, viz .-- in suffrage to females were made.

off a crop of corn, and upon the snow covering The statement shows that this farm has been wheat or rye, and in the spring withouts or other tivated with judgment, economy, and skill, in spring grain, and that he is satisfied the last is the bundry; and this impression, we think, its best time and way of sowing it. He observes pearance would make on any agriculturist who that he made several experiments of sowing grass over a good common road. This appears a comuld happen to pass by it. The barns are large, seed alone in the fall, but always found that the

k in the winter, which might be adopted with cultural Society of that county, judged that as antage in smaller buildings. The crops of the many as three or four acres, out of cleven acres year taken together were large, and it is be- of corn planted by him this year, would yield as ed few, if any, farms in Massachusetts will be much as 90 bushels to the acre, and awarded him id to have yielded a greater profit to the culti- a premium for it. The land on which this crop r. The expense for labor, it will be seen, was raised was broken up the same year, having small in proportion to the work done. His been manured on the grass for three or four years on, which was the principal, and probably the from the hogpen, when it was planted. Mr Allen at the rate of 18 or 20 miles an hour. has not stated the quantities of manure used by s the milk was sent to market instead of being him in any case, and as to most of his crops has ufactured into butter and cheese on the farm, given us only an estimate of their amount. This ecount of the management of it possibly may omission, we suppose, may be owing to his not rebe so generally useful to agriculturists, as a coiving the notification of the Trustees offering intelligent account of the management of a this premium, and prescribing the particular inforfarm might prove. We think, however, the mation that must accompany his application, until mer in which Mr Ware has cultivated this his manure had been applied and most of his crops gathered. The first notice he received, he says, was only two days before he made out his statement, viz. the 16th of October.

The committee much regret this accident, but they consider that the utility of the premiums of farms will essentially depend on their obtaining from the applicants a precise specification of their whole process of carrying them on, and of the crops they yielded; and that from the want of this particularity in Mr Allen's statement, the Trustees would not be justified in awarding him a premium.

WILLIAM PRESCOT, Chairman. To be continued.

Rail Roads.—The Baltimore American remarks. that the country people in that part of the State, who are in the habit of employing a driver and a team of five or six horses in sending a wagon load of sixteen barrels of flour to market, at the rate of about twenty miles a day over the best turnpike roads, will perhaps be a little surprised when informed that on the railroad, last week loads of seventyfive barrels of flour were repeatncipally as a Sheep Farm. It is washed on edity brought from Ellicott's mills to Baltimore, by Ie by the Housatonic, which annually over- a single horse only. The distance was travelled a tract of 40 acres of meadow, bordering on with ease in two hours, being at the rate of six leaves a deposit on the land that renders and a half miles an hour. Much greater loads rther manure or dressing unnecessary. From than these have been heretofore drawn by one act, if Mr Allen is not mistaken in his esti- horse, but the fact we have just stated will neverhe gathers annually from eighty to ninety theless be deemed sufficiently striking to illustrate cetter than two tons and a quarter to an acre, the utility and value of rail-roads and the ease , ject and utility of their creation. best of English hay. A young orchard of cheapness, rapidity and certainty with which comeighteen acres, and about five acres more modities may be transported on them, either to or

RAIL ROADS .- Niles' Register says -- loads of seventy-five barrels of flour are now brought from Elicott's mills to Baltimore, 13 miles in two hours. by one horse, without more apparent labor than is cause: I by the drawing of a gig, with two persons, mon load. On the 15th inst, one horse drewfour carts laden with one hundred barrels of flour, from the mills to the relay house, six miles, at the rate of seven miles an hour-another horse then drew the same load with equal speed to the depot in Baltimore. Neither horse appeared distressed. This result is the effect of the almost entire annihilation of friction in the machinery of Winan's improved cars of Mr Cooper's model. A locomotive engine is plying on a part of the road, for the cows, averaged 277 gallons of milk for the before, and was dunged in the hill with manure gratification of those who wish to ride by steam,

Many rail roads are about to be made in different parts of the United States, the subscriptions for which have overflowed. The Liverpool and Manchester rail road has made unexpected dividends. The stock is at a great advance, though the road cost about £35,000 a mile.

A late Liverpool paper says-On Saturday last the Majestic, a new engine which has just been put on the railway travelled 6 times between Liverpool and Manchester, a distance of one hundred and eighty miles! The total quantity of goods conveyed backwards and forwards, amounted to one hundred and 42 tons! The same engines travelled on Monday one hundred and twenty miles, with loads similar to those taken on Saturday. There are now ten engines of Mr Stephenson's employed on the railway.

The expense of fuel, oil, and attendance on this engine, is said not to to exceed \$5 a day. At this rate of cost, 25,560 tons may be transported one mile for five dollars-or fifty tons one mile for one

NATURAL HISTORY.

'The science of Natural History is eminently important to the civilized world, and ought to be duly appreciated and thoroughly understood. The study and pursuit of its various branches are fraught with instruction to man, evincing the subserviency of the products of na-ture to his will, and industry. Of the benefits of this ture to his will, and industry. Of the benefits of this science in the improvement of many arts, no one doubts. Our food, our medicine, our luxuries, are improved by it. There is not a department of human inquiry or labor, either for health, pleasure, ornament or profit, but is indebted to this science for support. It is an interesting and landable source of enjoyment, by which the mind is expanded, and the heart warmed and animated with the glowing spirit of devotion. He who surveys the vast field of nature, and devotes a portion of his time to the study of the principles which influence or gov-ern the motions of animated beings, however minute they may be, will not only derive pleasure from the pursuit, but will gain the only means of discovering the ob-

The Snow-ball, or Guckler Rose, and the High Cranberry, of our swamps, take readily, by inocula tion, each on the other. To me, a Snow-Ball when covered with flowers in spring, and loaded with the fruit of the High Cranberry, in autumn, and through the winter, is a novel spectacle, though not rare. Both the snow-ball and the cranberry, however, in the garden, are so apt to be loaded with insects, that I have had to cut down all the bushes with their leaves, for two summers in succession. I had rather forego the pleasure of this new family alliance, than breed such hosts of ene-

BOSTON, WEDNESDAY EVENING, APRIL 6, 1831.

FARMERS' WORK FOR APRIL.

SPRING WHEAT. Continued from page 294.

Your seed should be of the largest and finest of the crop, well-ripened before it is harvested. With regard to its preparation both to prevent smut, and to quicken and invigorate its early growth, almost every farmer has his favorite recipe; and the accounts which our paper contains of the manner of cultivating the wheat crops which have from time to time entitled diligent and skilful cultivators to premiums from our Agricultural Societies give modes for preparing seed wheat for sowing, which have been found useful by that infallible guide, experience. The method used by Payson Williams, Esq. of Fitchburgh, in raising his premium crop, is the most simple, least expensive and probably as effective as any. He prepared his seed wheat by 'a thorough washing, after which it was immersed in thick whitewash made from good lime so as to coat every kernel-no fears need to be entertained from the plentiful use of this liquor, as by way of of experiment, I have planted wheat after its lying in this liquor four days which vegetated well.' A variety of other ingredients, such as salt, blue vitriol, salt petre, urine, arsenie, &c, &c, have been recommended for forming steeps for seed wheat, but it is believed that lime is the safest, and perhaps it is quite as effective as any which is ever used for that purpose.

The quantity of seed to the acre recommended by our best agriculturists is from 2 to 2½ bushels. In Hagland, however, acording to the supplement to the British Encyclopedia, the quantity varies from two bushels or less to three and sometimes even four bushels per English statute acre. Land sown early requires less seed than the same land when sown late in autumn or in spring; and poor land is at all times allowed more seed than

rich land,

It is recommended in Lordbu's Husbandry to sow aborder of rye round the field of wheat to prevent its being blasted. The writer states that 'Mr Isaac Young of Georgia mixed rye among his seed wheat and thus escaped the blast of his wheat. It was repeatedly tried till he was convinced of its efficacy; and then he sowed five acres of wheat surrounded with a list (or border) 25 feet in breadth of rye; this also succeeded and being repeated is found a certain security to wheat. It is very important to pass a heavy roller over the ground soon after the wheat is sown and harrowed in, especially when grass seed is sown, as well to level the ground for the seythe as to answer the other important purposes of that useful implement.

The following letter to the Trustees of the Plymonth County Agricultural Society on the subject of cultivating spring wheat, written by Dr James Thacher of Plymouth, to whom the community of cultivators is indebted for the Orchardist, Treatise on Bees, &c, was republished from the old Colony Memorial in the 2d volume of the New England Farmer, page 285. We present it again to our readers, as containing a plain and concise exemplification of some the best rules for growing spring wheat.

rods, consists of a rich loam, but a small part of afterwards they were not so much rotted as t it very gravelly and apt to suffer by drought. It oak. In 1772, a fence was made partly of che produced a tolerable crop of Indian corn and nut and partly of oak posts and rails-the tre potatoes the two preceding seasons. In April last made use of were of the same age, and were wi it was covered with a full coat of stable manure, may be termed young trees. In nincteen yes and on the 15th and 16th of the month it was the oak posts had so decayed at the surface, as ploughed twice and harrowed; after which the need to be strengthened by spurs [braces] wh wheat and grass seed being sown, it was again the chesnut required no such support. A gate pe harrowed. The wheat was immersed in sea water of chesuut on which the gate had swung for fit twentyfour hours and afterwards rolled in lime, years was found quite sound when taken up, a The quantity sown was one bushel, and of that a barn constructed of chesnut in 1743 was fou species of wheat from Italy, the straw of which quite sound in every part in 1782. It shot is employed to make leghorn bonnets. The wheat seem, therefore that young chesnut is superior exhibited the most favorable appearance during young oak for all manner of work, which must the season, entirely free from smut or mildew and put partly in the ground, * in August at was harvested. The produce is eight if the lower ends of posts are seorched it teen bushels one peck and two quarts. The grain is hot flame before they are put into the groun remarkably well formed, and being ground and they will last the longer. The posts should be set at least two feet in t is now covered with a superior growth of herds. ground. Some farmers cut their posts so lor

climate and soil are well adapted to the productione come rotten. tion of summer wheat. One of my industrious neighbors obtained a few years since, 31½ bushels from an acre; and another has expended in his family no other floor than the produce of his own soil for the last five years. Our farmers in this county are greatly deficient in their attention to this object, though it is believed that every farm would afford suitable land to yield wheat sufficient for the consumption of the family. On the principle of profit and economy the cultivation of wheat ought to be encouraged, more especially as it is found to be the preferable grain to accompany clover and herdsgrass for moving the ensuing

PENCES.

Fences now require a general, thorough, and critical review; and all deficiencies should be supplied with materials somewhat more durable than a snow bank in April. Cattle when first permitted to take leg-bail, after a winter's imprisonment are very apt to become tresspassers on the ficehold, without regard to any man's right of property. Hunger arges them to pass over or break through even stone walls, unless they are surmounted by poles, secured by stakes, and thus present an effectual barrier to the predatory excursions of the most desperate quadrupeds,

In many parts of the country posts and rails will be found the cheapest materials for fences; and with proper precantions may be rendered very durable. In making fences of this description, it is advised by Mr Preston, of Stockport, Penn. to set the posts, with the top parts in the ground, and he asserts that they will, in that position, last three or four times as long as when they are set with the butt ends down. He advises, also, in making fences always to place the rails with the heart side up,

The best timber for rails, according to Dr Deane. is red cedar. It is easy to split, light to carry and handle, sufficiently strong, and the most durable of any. In the Transactions of the Society of Arts, in England, there is an account, which states in substance that posts of oak, and others of chesnut were set down in Somersetshire, where they had to undergo repairs in 18 years. The oak posts Austria. were then found to be unserviceable, and the ches-

few seions of the celebrated Russet Sweeting-a itiful native apple that originated in Templeton. The is a free grower, and bears well-the fruit is a fine est, and has kept till June—a specimen can be seen to. 52 North Market street. It is in eating from Nober to May.

so-500 lbs fine Southern Clover, put up in Pennania expressly for our retail trade. Farmers in want good Southern Clover seed are requested to examine April 6.

Howard Improved Patent Cast Iron Plough.

For sale at the Agricultural Warehouse, 52, North Market street, Howard's Improved patent Cast Iron Plough, of all sizes, which are found on trial to exceed any plough that has been in use. The mould board is formed on such true mechanical principles as to entitle the proprie or to a patent, against which he forbids all persons tresp ssing. The Ploughs in every part are finished in a very superior manner. The Mould boards are ground smooth, which renders them fit for immediate use, and they are warranted in every respect. From the long experience the patentee has had in manufacturing Ploughs, he feels confident that he now offers to the publie an article that cannot be surpassed in principle or workmanship.

Grape Vines.

The subscriber offers for sale at his garden at Dorcheser, a few Cuttings of the black and white 'Moscatel Grape Vines, just received from Cadiz, procured for him by the Consul of the United States, resident there. He says, 'I obtained these cuttings from Vines on which I have seen clust rs of Grapes weighing as much as TWEN-TYSIX POUNDS. They contain several joints and will be sold at 50 cents each.

250 Isabellas, 2 years old;

1400 1 yr 300 White Muscadine; Caroline; Black Hamburg ;

Constantia; Golden Museat;

Napoleon, Gore's, a beautiful black fruit: 8 Varieties of superior truit from Xeres and Malaga;

Some large Vines from France, that have borne fruit two seasons, very prolific and of fine quality; 159 CATAWBAS;

100 Bland's ;-and several other kinds,

Orders by mail addressed to the subscriber, or personal application at his office, 74 Congress street, and to Patrick Kennedy at the Garden, for any number of Vines, from one to one hundred, will meet with prompt attention. ZEBEDĖE COOK, Jr.

March 12, 1831. 5t

Grape Vines.

The subcriber offers for sale, several hundred Grape Vines of one and two years growth, and uncommonly healthy and thrilly. They have been raised with great care from Vines which have been forty years in this elimate, and are of the kind which obtained the premium of the Horticultural Society the last season. Also, a few Isabella, and several other varieties. Orders for any number of Vines left with Mr J. B. Russell, at 52, North Market street, Boston, or with the subscriber at Charlestown, will be attended to. DAVID FOSDICK. Charlestown, March 23, 1831.

20,000 White Mulberry Trees.

Orders received by the subscribers for the above Trees, to be delivered in the month of April; they are from one to three years old, of the first quality, and will be sold on reasonable terms. c GREGG & HOLLIS,
—Dealers in Medicine, Paints, Oil, Window Glass, &c.

No. 30 Union street, Boston. 4t March 16.

Stock for Sale.

Seven very fine English BULLS, crosses of the Holderness, Durham Short Horns, Ayrshire, and North Devonshire breeds of Cattle. They are from one to three years old, and from seven-eights to full blood, and very superior animals, and all in fine order. Prices from \$100 to \$400. Also two or three very fine Stallions, one of them is half Arabian and half English, six years old, 15½ hands high-the other a full-blooded English horse, six years old, 16½ hands high—they are both very superior animals. Apply, personally, to J. B. RUSSELL, Publisher of the New England Farmer, Boston.

Evergreens, Silver Firs, &c.

The subscriber being engaged in the Seed business would be happy to receive orders for Forest Trees, Seeds, and Evergreens from Maine, and being Agent for J. B. Russell, Boston, and Prince & Sons, Flushing, N. Y. orders sent through them or otherwise, will be attended o without delay. Particular directions for taking up and packing is requested. WM. MANN.

Augusta, Me., March 26. A list of Mr Mann's prices for Evergreens, &c, can be seen at the New England Farmer office.

Agricultural Seeds.

For sale at the New England Seed Store, 52, North Market street, Boston,

Spring Ryc; Millet; two-rowed Barley; Northern Buck Wheat; Perkins' Early Seedling Potatoes, (that took the premium from the Massachusetts Corticultural Society); Burnham's Premium Potatoes, (that have twice taken the premium from the Essex Agricultural Society, as the best stock potatoes raised in the county); Early Mauly Potatoes, (originally from Europe); Grass Seeds of all kinds, &c .- ill of the very first quality.

ASPARAGUS ROOTS.

mer Savory At this Seed Store can be found the greatest variety of Field, Grass, Garden, Herb and Flower Seeds, to be found in New England, of the very first quality, and at fair preces, wholesale and retail,

Also, Fruit and Forest Trees, Grape Vines, (of both native and European origin,) and Ornamental Shrubs at Nurserymen's prices. March 2.

Silk-Silk.

The Subscriber, of Jaffrey, Cheshire county, New Hampshire, has two or three thousand White Mulberry Trees of three years' growth, in fine order for transplanting the present Spring, which he will dispose of on reasonaule terms. Inquire of ISAAC PARKER, 74 Water street, Boston, or the subscriber. ASA PARKER. Juffrey, March 15, 1831.

Gardener Wanted.

Apply to ZEBEDEE COOK, Jr. No. 75 Congress street March 30.

> BRIGHTON MARKET-Monday April 4. [Reported for the Chronicle and Patriot.]

At Market this day 358 Beel Cattle, 19 *pair Working Oxen, 16 Cows and Calves, and 1076 Swine. 148 Beef Cattle were reported last week; unsold at the close of this day's market 103, all good cattle.

PRICES .- Beef Cattle-Although there was more than a sufficient number of Cattle to supply the market, ret little better prices were obtained on some qualities. We quote from \$4 50 to 5 25. From 15 to 20 were taken at 5 50 a 5 75.

Horking Oxen-Sales at \$53, 65, and 80.

Cows and Calves .- Sales at \$15, 17, 21 and 24. Swine .- Considerable doing; an entire lot, two-thirds barrows, at 4½c.; one lot 4½c. for sows, 5½c. for barrows. Small selected lots 43c. for sows, 53c. for barrows; one lot, to close, at 48c.; one of 111 averaging about 250 lbs. each at 4ic. At retail, 5e, for sows and 6 for barrows.

MISCELLANY.

From Hood's Comic Annual.

THE DUEL.

In Brentford town, of old renown, There lived a Mister Bray, Who fell in love with Lucy Bell, And so did Mr Clay.

To see her ride from Hammersmith, By all it was allow'd Such tair outsides are seldom seen, Such Angels on a Cloud.

Said Mr Bray to Mr Clay, You choose to rival me, And court Miss Bell, but there your court No thoroughfare shall be.

Unless you now give up your suit, You may repent your love, I who have shot a pigeon match, Can shoot a turtle dove.

So pray before you woo her more. onsider what you do; If you pop aught to Lucy Bell-I'll pop it into you.

Said Mr Clay to Mr Bray, Your threats I quite explode; One who has been a volunteer Knows how to prime and load.

And so I say to you unless Your passion quiet keeps, I, who have shot and hit bull's eyes, May chance to hit a sheep's.

Now gold is oft for silver changed, And that for copper red; But these two went away to give Each other change for lead.

But first they sought a friend a-piece, This pleasant thought to give-When they were dead, they thus should have Two seconds still to live.

To measure out the ground not long These seconds then forbore, And having taken one rash step, They took a dozen more.

They next prepared each pistol-pan Against the deadly strife, By putting in the prime of death Against the prime of lite...

Now all was ready for the foes, But when they took their stands, Fear made them tremble so they found They both were shaking hands.

Said Mr C. to Mr B. Here one of us may fall, And like St Paul's Cathedral now, Be doon'd to have a ball.

I do confess I did attach Misconduct to your name;
If I withdraw the charge, will then Your ramrod do the same?

Said Mr B. I do agree-But think of Honor's Courts! If we go off without a shot, There will be strauge reports.

But look the morning now is bright, Though cloudy it begun; Why can't we aim above, as if We had call'd out the sun?

So up into the harmless air, Their bullets they did send; And may all other duels have That up-shot in the end!

From the Tyne Mercury, New castle, England, Dec. 12, 1830.

INTERESTING AND AUTHENTIC STORY.

In our paper November 16th, we extracted from Mrs, Alaric Watt's New Year's Gift, a rather romantic story respecting the ship Ravensworth breaking from her moorings, and going to sea with only a little boy on hoard, which possessed like. The soil is principally a sandy toam, much of a local interest from the event stated, occurring at Shields. We find that the circumstance excited a The land yields first rate crops of Grass, Rye, Oats, Ba great sensation here, and is perfectly remembered ley, Potatoes and Flax; and on some lots, good Whe be interesting, therefore, to record the facts which took place, as they differ from the fictitious narrative in several particulars. The Ravensworth, in the first place, was not an old Greenland what ler, as she is represented, but was a small ship of about 200 tons, belonging to Messrs Mosley and Airey, coal fitters of Newcastle, Mr Robert Atkinson, commander, regularly employed in the coal trade, between Newcastle and London. She the metropolis. She was driven from her moorings. at North Shields, while there was a strong fresh in the river. All the crew as stated, were at the time on the shore, except the cabin boy, a lad about eleven years of age. This occurrence, which, as we have observed, excited great interest in the neighborhood, took place about 1792 or 1793. Soon after it was known that the vessel had gone to sea with only a little hoy on board, the Unity belonging to Mr N.Clark went out with capt. Atkinson, the master of the Ravensworth, in search of her. They did not succeed, however, in meeting with her, and returned. It is not true, as stated, that the Ravensworth was three weeks tossing about on the German Ocean and was then driven on the coast of Holland. The little sailor who constituted her sole pilot, had the prudence, as mentioned in the tale, to lash the helm, so as to keep her from the shore, and he not only hoisted the forestaysail but hoisted what is called 'a Jack' on the fore-topmast rigging. This attracted the notice of a Harwich smack, when she was near Flamborough Head, on which she went to her assistance, and as we are informed, took her safely into the harbor of Harwich, after she had been buffeting with the waves for five days. It is worthy of note that the ballast port was open at the time. The little fellow was busy frying pancakes when the Harwich ber smack came to the Ravensworth. It is perfectly recollected here that when the young sailor returned to Newcastle, he was taken to the Exchange and shown as a little hero, and several of the merchants gave him silver in token of their admiration. The author of the story in Mrs. Watt's Anmual, represents him as an old gentleman in his wig, recounting his adventures. This is not onite correct; if he is now alive, he must be under fifty years of age.

Sympathetic Ink .- Dissolve a small quantity of starch in a saucer with soft water, and use the liquid like common ink; when dry no trace of the writing will appear upon the paper, and the letters can be developed only by a weak solution of iodine in alcohol, when they will appear of a purple color which will not be effaced until after long exposure to the atmosphere. So permament are the traces left by the starch, that they cannot (when dry) be affected by Indian rubber, and in another case a letter which had been carried in the pocket for a fortnight, had the secret characters displayed at once, by being very slightly moistened with the abovementioned preparation.

Valuable and Cheap Land-for Sale.

Augusta, Me. WM. MANN. Halifax, N. S.-P. J. Holland, Esq. Recorder Office. Montreat, L. C .- A. Bowman, Bookseller

Hurtford-Goodwin & Co. Booksellers, Newburghort, Eberezen Stedman, Bookseller, Portsmouth, N. H. J. W. Foster, Bookseller, Portland, M.—Samuel, Colman, Bookseller.

The subscriber offers for sale, 14,000 acres of choice Land, situated in the town of Pinckney, county of Lew and state of New York. Some of the land is improve and under cultivation. The country is remarkably her i toy, being entirely free from the fever and ague and fre the common bilious fevers which often afflict the town upon Lake Ontario, this town being 18 miles east of the covered with rich black mould. The timber is chief Sugar Maple, Black Ash, Butternut, Beech, Elm, & by some gentlemen older than ourselves. It may and Corn may be grown. To those wishing to obtain a perior grazing tarms, a fine opportunity now offers itsel The produce of pasturage and hay from an acre of the Land, is very large, fully equalling if not surpassing the from the same quantity of land in any other of the Blac River townships. The land is admirably well watered there being but few lots which have not durable runnin streams upon them. The land is well adapted to Orchan ing-the Apple tree thriving very well in this county Stock of all kinds may be disposed of with the least poss ble trouble, and to the greatest advantage, the drover purchasing at the very doors of the farmers, and payin the highest cash prices for their cattle, which will readil was light and not laden, having just arrived from hind purchasers at all seasons of the year. Several far mers at present residing on this town, were original from the New England States, and some of them from Massachusetts, who are in thriving circumstances. Th above described land is offered for sale at the very lor price of from two dollars and a half to three dollars peacre, for the uncleared land, and from three dollars and half to five dollars and a half for the improved lots. The hand will be sold in lots to suit purchasers, and from two to five years' credit for payment, in annual instalments will be given. As a further convenience to purchasers the subscriber will receive in payment, Cattle, Sheep Icrk, Grain or Grass Seed, for which products he wil allow the highest cash prices. The title to the land i indisputable, and good Warranty Deeds will be given to purchasers. Persons desirous of purchasing will pleas to apply to the subscriber, at Henderson Harbor, count of Jefferson, State of New York, or to DAVID CANFIELD Esq. on the town. JAMES II. HENDERSON.

CHOLETICHMUC:

FOR THE NEW ENGLAND FARMUR.

SPATED COWS.

R Frssender-Some years since, I passed a ner at Natchez and put up at the Hotel then by Mr Thomas Winn .- During the time that s there, I noticed two remarkably fine cows, were kept constantly in the stable, the serwho had charge of the horses, feeding them arly, three times a day, with green Guinea ent with a sickle.

ese cows had so often attracted my attention, count of the great beauty of their form and red color, the large size of their bags and gh condition in which they were kept, that at length induced to ask Mr Winn, to what of cattle they belonged, and his reasons for ig them constantly in the stable, in preferto allowing them to run in the pasture, where ould enjoy the benefit of air and exercise, the same time crop their own food and v save the labor and trouble of feeding them? inn in reply to these inquires, stated, that o cows which I so much admired, were of nmon stock of the country and he believed nish origin-but that they were both spayed ed that they had given milk, either two or ears.-Considering this a phenomenon (if nature, at least in art) I made further inqui-Mr Winn, who politely entered into a very ting detail, communicating facts, which were aordinary, as they were novel to me, and ng that they will prove equally as interestour numerous agricultural readers, as they me, I am induced, on the request of a to offer them for publication in your very . Journal, in the hope, that some of the who supply our large towns with milk, em them of sufficient importance, to make ents for the purpose of ascertaining whethesults which they may obtain, will corrobe facts stated by Mr Winn, and which, portant benefits, not only to farmers, but to reepers and other inhabitants of cities, ages who now keep cows, in order that y be sure of a constant supply of pure and rated milk.

Vinn, by way of preface, observed, that of the ploughing matches which were an- ments. eld in some of the Southern Counties of and although there was no connexion that subject and the facts which he should was nevertheless the cause which first dents which resulted in the discovery of degree of ridicule. of which he detailed and which I will rranas accurately as my memory will enable

Mr Winn's frequent reflections, had (he said) led him to the belief - that if cows were spayed munication, to make experiments, they will find soon after calving and while in a full flow of milk, it better to spay cows which have had several they would continue to give milk for many years, calves, rather than heifers, as at that age, their bags without intermission or any diminution of quantity, are usually large and well formed, and are capaexcept what would be caused by a change from green ble of carrying a much greater quantity of milk to dry or less succutent food.

To test this hypothesis, Mr Winn caused a very animals. good cow, then in full milk, to be spuyed; the operation was performed about one month after the cow had produced her third eaff; it was not attended with any severe pain or much or long continued fever; the cow was apparently well in a few days and very soon yielded her usual quantity of milk and continued to give milk freely, for several years, without any intermission, or any diminution in quantity, except when the feed was scarce and dry-but a full flow of milk, always returned, upon the return of a full supply of green food. - This cow ran in the Mississippi low grounds or swamp, near to Natchez, got cast in deep mire and was found dead,-Upon her death, Mr Winn caused a second cow to be spayed, the operation was entirely successful, the cow gave milk construtly for several years-but in jumping a fence, stack a stake in her bag, that inflicted a severe wound, which obliged Mr Winn to kill her. Upon this second loss, Mr Winn had two other cows spaned, and to prevent the recurrence of injuries from simular causes with those which had occasinned him the loss of the two first spayed cows, a resolved to keep them always in the stable, or some safe inclosure and to supply them regularly with green food, which that climate, throughout the greater part, if not all the year, enabled him to procure.

The result in regard to the two last spayed cows, was as in the case of the two first entirely satisfactory, and fully established, as Mr Winn believel, the fact, that the spaying of cows, while in full milk, will cause them to continue to give milk during the residue of their lives or until prevented by old age.

Waen I saw the two last spayed cows it was I they be fully confirmed, may lead to great believe, during the third year that they had constantly given milk, after they were spayed.

The character of Mr Winn, (now deceased) was highly respectable and the most entire confidence could be reposed in the fidelity of his statements, and as regarded the facts which he communicated in relation to the several cows which he if my health is preserved, I shall probably return to In former years been in the habit of read-had spayed, numerous persons with whom I my residence at Mount Republic, Wayne County, English Magazines which contained ac- became acquainted, fully confirmed his state-

public, and peradventure, his discovery might prove his mind into that train of thought and not to be new, as doubts in regard to the facts, g, which finally induced him to make the might where he was unknown, subject him to some

ont, after the lapse of more than twenty stock of cows, that would be constant milkers, are but I would, most freely, inquire for, search out, too obvious, to require an enumeration.

Should gentlemen be induced from this com-(without pain and inconvenience,) than younger VIATOR.

Keene, N. H. April 1, 1831.

Proceedings of the Massachusetts Horticultural Society, at a meeting held of the Hall of the Institution on the 9th of . Ipril, 1831.

Report made by H. A. S. Dearnoux, President of the Society.

It is with great pleasure, that I am enabled to announce encouraging indications of the deep interest which has been excited, in all parts of the Union, in favor of horticultural pursuits. A spirit of inquiry has gone forth, and a .eal for collecting and disseminating intelligence, seeds and plants, has been evince I, within a few years, which presage great results. The liberality, which has been extended towards our institution, by numerous intelligent, patriotic and generous fellow citizens, as well as by many foreign honerary and corresponding members, merit our grateful acknowledgements. Having acquired a reputation, far in advance of our actual means of utility, and of the services which have been rendered to a most interesting and valuable department of tillage, we must strennously endeavor, to reach the level of publie expectation. I renewed efforts, to make our labors more circuly and extensively beneficial.

To insure success, in any undertaking, unremitting industry and a resolute determination, to surmount all impediments are indispensable; and with such powerful means nothing is impossible,

Since the last meeting, the following letters have been received.

1. A letter from Sheldon Norton of Pennsylvania, now making a tour through the south western states.

Conecuh County, Alabama, Jan. 4, 1831. GEN, H. A. S. DEARBORN,
President of the Mass. Hort. Society.

SIR-I am now in Alabama with the view of promoting the cause of Sunday School instruction. I have, though a Layman, been urged to this course by a high sense of religious duty. All the energies of my mind will be devoted to this service, for some 8 or 10 months yet to come. At which time, Pennsylvania.

Feeling an interest in whatever may refine the At the time to which I alluded, I endeavored to taste, improve the mind, or add to the proper en-, performed by cattle, and that he had persuade Mr Winn to communicate the foregoing joyment of my fellow-men, I have viewed, with much that the prizes were generally adjudged facts to the late Judge Peters, then president of pleasure the organization and successful operations eplough-men, who worked with spaned the Agricultural Society of Pennsylvania. But he of the Mass. Horticultural Society; and have been was restrained from complying with my request by induced to offer any service that may promote the an extreme unwillingness to appear before the success of that Association, and that may be consistent with the performance of a higher duty.

If the Society should not have a correspondent. resident in this State, whose friendly attentions may make my offer unnecessary, you can command, from The many and great advantages that would re- me, any compatible service which my limited pesult to the community, from the possession of a cuniary resources will admit. I am no Botanist, and forward, in such manner as may be directed,

enttings, seeds, &c, of any desirable varieties of fruit, plants, &c.

I have been informed by Mr Mobley, a respectable planter of Clarke County, and who had been for a number of years a member of the Legislature of this State, that a successful method of propagating rare varieties of fruit, as practised in this climate, is by planting cuttings thereof early in the Spring. Of this, my informant stated the most indubitable testimony could be given. For examples of successful practice he referred me to two or three of his friends. Notwithstanding the unusual drought of the last season, Mr Mobley had been successful with cuttings of the peach and quince, and with a considerable proportion of his apples.

Thrifty suckers, termed, by him, 'water sprouts,' are taken from choice trees, and planted in a horizontal trench, and covered, to the depth of six or seven inches, throughout, with the exception of one or more points-according to the length of the cutting-containing one or two bads exposed to the influence of the light and air. If the cutting should shoot forth at more than one point, the number of plants would be multiplied by separating the cutting between the shoots with a chisel the ensuing year.

I must confess that I have been induced, by witnessing unsuccessful experiments, to be not a little scentical as regards the propagation of rare varieties of the apple, pear, peach and cherry, by planting cuttings thereof. But, if I am permitted to sit down in my family circle again, I think I will allow my scepticism to give way, so far as to prove, by practical experiments, whether I have, this time by the Colombians; using that name, I suchit upon a successful modus operandi.

We have, in Wayne County, Pa. two or three known native varieties of apples, which are believed to possess qualities that would commend them for general cultivation.

We have also other valuable varieties in cultivation, whose different synonymes I have not had the means of determining. The obstacles, in the way of a direct freight to Boston, have prevented my forwarding samples of our best varieties. The difficulties are now in some measure removed by the construction of the Delaware and Hudson Canal.

Letters addressed to me at Montgomery, Montgomery County, Ala. will probably reach me, in the course of from 3 to 5 weeks. I expect to make a short visit to Mobile, and possibly to Pensacola.

I am, Sir, very respectfully,

Your obedient servant,

Sheldon Norton.

A letter has been sent to Mr Norton, thanking him for his kind proffer of services, with assurances of the high value we place upon them, and of the obligations which he will impose upon us, by such contributions, as it may be in his power to make, to our fund of information, in any of the divisions of horticulture, or to the existing collections of indigenous plants.

Such voluntary tenders of assistance, indicate the universal excitement, which has been induced for the development of the various branches of rural economy, while they claim our admiration as Americans, and our gratitude as a society.

2. A letter from Gidcon B. Smith, Esq., Editor of the American Farmer, published in Baltimore.

Baltimore, March 31, 1831.

SIR-I have taken the liberty of forwarding to

small box, containing a dozen roots of Aracacha, tempted to acclimate them. He placed them, for the use of the Horticultural Society of which his green house, where they passed the winter you are, I believe, president, and request their ac- security. The following spring, when the fre ceptance of it.

ble root in a sound and vigorous state. Last fall they perished; and Doct. Mitchell expressed doul I imported one hundred and forty roots, and have as to the possibility of introducing the culture succeeded in preserving them perfectly sound to the Aracacha so far north; still Mr Floy believ the present time by merely packing them in moist earth and keeping them in a cellar protected from frost. They are now growing finely in my conservatory, and I have no doubt of perfectly succeeding in their cultivation in the open ground.

I have just made my second importation, and the roots are equally as sound as the former ones. Her Soulange Bonn, at the horticultural est Those I send you are part of this last lot,

I am somewhat fearful that your season will communication, in the number of the Journa not be long enough to allow the roots to attain a that Institution, for August last, he appears to proper size; but that is all the doubt I have of tertain hopes of ultimate success and thinks their succeeding with you, provided the roots be valuable vegetable may be cultivated, in the sor planted and steadily kept in a shady cool situation.* ern departments of France, Spain and in Italy This appears to be the only difficulty—the heat of advantage. He states that it is cultivated in our sun is their only enemy in this country. The Botanical Garden of Montpellier and flouris reason, I apprehend, of the ill success of former in that of Geneva. Experiments have also b attempt to introduce this valuable esculent both made in the Garden of the London Horticula into N. America and Europe, is that edible roots, such as are sold in the markets of Caraccas, clay, Esq., at Plymonth, and by the great nurst were taken; whereas the little offsets that spring men, Messrs Loddiges. from the large roots are the proper ones. Another cause may have contributed to this failure. I employ- into Cuba and Jamaica, and if our climate she ed two gentlemen in two successive years to obtain aracacha for me, but they could find none in all Colombia. I then learned that it was called apple ceeded.

I am with due respect yours,

GIDEON B. SMITH. Ed. Am. Farmer.

*The temperature of their native climate is seldom above 70; they should have a rich black soil.

The present which Mr Smith has so generously transmitted, is most worthy of our especial attention, and claims the assiduous care of such of the members, as have the requisite means of making a thorough experiment,

The Aracacha has recently attracted the notice of most of the celebrated horticulturists in Europe, and is considered as destined to assume an important station among esculent vegetables. It is a native of Santa Fee, Bogota, New Granada and other parts of South America, where it is considered the most useful of all the edible roots; being superior to the common, and sweet Potato, (Convolvulus Batatas); it is extremely grateful to the palate; so tender that it requires but little cooking, and so easy of digestion, that it is the common practice, where it is cultivated, to give it to convalescents and persons who have delicate stomachs. Starch and a variety of pastry are made of its fecula, and it has all the advantages of Arrow-root and Tapioca,

In 1825, that distinguished botanist, the Baron de Schack arrived in the United States from Trinidad, and brought some of the roots of the Aracacha, for the purpose of introducing its cultivation in the southern and middle states, where he believed it could be successfully done. Doct, S. L. Mitchell, ever conspicuous for his zealous attention to whatever may subserve the cause of science and the interests of his country, took great interest in the experiments.

Plants were confided to Mr Michael Floy, a your address by the brig Hamilton, Capt. Foster, a meritorious nursery-man of New York, who at that all the discoveries and improvements,

had passed, they were transplanted into the g I have twice succeeded in importing this valua- den; but the season having been unusually d that it could be propagated in the latitude of Lo Island, and he attributed the loss of his plants a too sudden exposure to the air, in the or ground, without any protection against advevicissitudes of the weather,

> An experiment was commenced by the Che lishment of Fromont, in April, 1829; and b Society at Chiswick, at Bury-Hall, by Robert I

> The Aracacha has been successfully introdu prove too cold, there is but little doubt it car propagated in the southern states, and may come the rival of the Sweet Potato.

The roots, or small tubers, are planted in So America, about twenty inches apart, with a sl inclination towards the south; when they sp above the ground, they are managed like the St Potato. As the flowers begin to form, they carefully placked, in order to concentrate the v of vegetation in the roots. At Santa-Fee, wl the mean temperature is about 73 degrees of l renh it's thermometer, the roots acquire their growth in six months. In Jamaica where Aracacha flourishes remarkably well, it is c vated in rather poor land, such as that of mountains of St Andrew, where there falls little rain,

It is well known to you, that Mr Smith to wl we are indebted for the Aracacha roots, succee John S. Skinner, Esq. as Editor of the Ameri Farmer. The latter gentleman has acquired a servedly high reputation, for his indefatigable forts, to advance the science and art of Agric ture and Gardening, throughout the United State and Mr Smith is actively pursuing the same m torious course, in a manner which must secure him the respect of the intelligent planters of ! ryland, and the benedictions of his fellow citiz in every section of the Republic. The labors those gentlemen are not only duly appreciated, the cultivators of the soil, on this side of the lantic, but have received the commendations those, on the eastern continent,

If a winged Mercury transmitted intelligen among the gods of ancient mythology, theg jus of the moderns has more than supplied office. By the art of printing, innumerable here are incessantly sent forth, who interchange tidings of every region of the globe; and such certainty and celerity, that they have only received the name, but far surpassed the! vices of Jove's fabulous messenger. It is t natsoever is useful or interesting to man, in the hundred in their proper places, and upwards of especially where our object in cultivating them is own; and individuals, distinguished for their dectual attainments, and arts of philanthropy, ead of being claimed as the citizens of a sinnation, are hailed as compatriots in the vast ublic of letters, science and the arts, and are versally honored as the benefactors of the hurace.

Respectfully submitted

By H. A. S. Dearborn. Pres. Mass. Hor. Soc.

he following resolutions were unanimously bted.

esolved, That the thanks of the Society be ented to Gideon B. Smith, Esq., Editoa of American Farmer, for the very acceptable ent of Aracacha roots, which he has kindly smitted from Baltimore.

esolved, That the Aracacha Roots be confid John Lowell, Esq., Thomas Nuttall, Curator the Botanic Garden, David Haggerston of lestown and Nathaniel Davenport of Milton; that they be requested to attempt their cultin, and report the results of their experiments e Society.

ie following members were admitted. DEON B. SMITH, Esq. Editor of the Ameri-

a corresponding member.

ions of the Warren apple were presented by han Warren, Jr, Weston. It is a native and in eating from November to April. The s large, skin yellow, freekled with red and

and dots. Said to be high flavored.

From Prince's Treatise on the Vine.

of a letter from Edward H. Bonsall, Esq. to author, dated

' Vineyard, Germantown, Pa. February, 1830. Deceived your communication, in due course, el under obligations for the kindness which sted it. In accordance with the invitation tned in it, I shall now proceed to give a y sketch of my practice and experience, so I understand your proposition to extend. I remise, that I commenced planting my vinen the spring of 1825, with from seven to housand cuttings, which I extended over icres of ground, arranging them with a view vines being when grown, at distances of raseven feet from each other. There was rage of two cuttings in a place. From the of planting (say first of April) for a period weeks, there was but about one fourth of a f rain, and the sun frequently warm. The ting principle was put in action, the sprouts , and deriving no nutriment from the soil, of them were soon killed, and dropped off. d something beyond one thousand. The nd most important part of the next season most equally unfavorable, which combining ie necessity of starting with very few of of the varieties, I was desirous of cultivating

rious career of civilization is immediately made one thousand more to be renewed. Thave such to make wine. confidence in the business being both practicable and profitable, that I contemplate planting one and a half acres more on a site well suited to the purpose, adjoining my present establishment.

Some of my vines produced fruit in 1827, pretty freely in 1828, and last year very largely, when my vintage produced eight barrels of wine beside my making sale of a considerable quantity of fruit in Philadelphia, &c. The ensuing season, I shall probably have more than double the quantity, as there are constantly new vines coming into bearing, and also others approaching their full capacity, which had previously made only a first or second effort.

As regards the varieties with which I have had most success, and to which I give the preference, I am unhesitating in ranking as the three foremost, the 'Catawba,' the York, (Pa.) 'Black Madeira, and the 'Isabella.' These seem to possess all the requisites for our purpose, more particularly as wine grapes,-and some persons admire them for the table also. They all produce excellent wood, ripening the shoots almost to the extreme end, even in the most unfavorable seasons and without any protection, pass through our coldest winters as securely as the oak of the forest. The 'Catawba' and 'Isabella' yield extra-abundant crops of fruit, and the York Black Madeira is also a very good bearer. Their fruit rarely fails to arrive at fine maturity, and is rich in saccharine matter,-the basis of wine. 'The 'Alexander' I am cultivating pretty largely, but my estimation of it is on the wane. It does not produce as good wood as those just mentioned, and is less certain of ripeping its fruit. I have some plants of the North Carolina 'Seuppernong' coming forward : but from conversation with some of my friends, who were familiar with it at the south, I doubt its adaption to extensive culture. They say, that as the berries commence ripening, they immediately loosen their connexion with the stem, and by slight agitation, fall in great numbers, as is the case with most of our Fox grapes. I have upwards of thirty additional varieties, several of which have not produced fruit, so as to enable me from personal observation, to place an estimate on them; and such as have, I do not think worthy of being brought into competition with the three first mentioned. There are some, the 'Elsenborough,' 'Orwigsburg,' &c, the fruit of which is good and generally ripens, but they hardly seem fitted f or vineyard culture, on account of deficiency in the size of the fruit, amount of produce, &c.

The wine Dr Hulings alluded to was part of a eask of one hundred and thirty gallons, made by me three years since, from the 'Alexander' grape, purchased of some of my neighbors, my vines not having at that time come into bearing. It has been pronounced by connoisseurs in Philadelphia, to be very similar in its character to a good Madeira, excepting that it was rather more Captain E. S. Bunker, which left New York on

cill and Delaware rivers-four miles from the former, and eight from the latter, at an elevation of three hundred feet above their level, having, vely, (and from which I have since been an aspect facing S. S. E., with a sub-stratum of ating, and gradually extending my stock,) light isinglass soil, and seems well suited to the propose to erect a Wind Grist Mill. The cost is obstructed the completion of my estab- purpose. From my experience, both on my own estimated at \$500. The amount of Grain conat, so that there are yet some vacancies to premises and at other places, it is my judgment sumed at the House annually, is about 5000 bushd. I have now about three thousand five that we should reject almost all foreign varieties, els.

LIVE FENCES.

Ma Editor-There is one very serious objection against adopting the suggestion of Mr Buckminster, of using the yellow locust for live fences, and that is, this tree is so prone to send up sprouts from its extended roots, that it would soon encumber the fields,

The avocations of the nursery forbid my adding anything further than that

1 remain, respectfully,

Your obedient servant, Albany, April 12, 1831. J. BUEL.

Premium.—The Plymouth County Agricultural society offer a Premium to that town which shall maintain the best piece of road, being a public highway, of a given extent within its territory. The improvement of roads is a worthy object for premiums. The funds of agricultural societies might be aided by the state and the fines of one town be bestowed as a bounty on others. As for some roads that we wot of, if there were 'sermons in stones' and preaching could avail any thing, no premiums would be required to improve their condition .- New Bedford paper.

Wool .- According to the present appearances in Europe, there will be a considerable rise in the price of wool. None could be obtained in Portugal or the frontiers of Spain in January, nor would there be a supply till next summer; at the same time, the demand for coarse wool was increasing and prices advancing. The stock in England was small, and of consequence the prices good, and would probably remain so. This will have an effect on the American market.

Lowers.-The demand for tenements in this town has never been so great as at the present time. We recently advertised one to be let, and have received not less than forty applications for it. Ten years ago our population was about one hundred and fifty; it is now not much less than seven thousand, and the prospects of the growth of the town. have at no time been so promising as at the present. Funds sufficient have been obtained to build a rail-road from Lowell to Boston; the Suffolk Company has recently been incorporated with a eapital of \$500,000, and have commenced erecting two mills with all the necessary appendages ; the Tremont Company is also just incorporated with a capital of \$500,000, all of which has been subscribed. Among the buildings to be erected this summer, will be a hotel on a very extensive scale, at the corner of Merrimack and Dutton streets.

Lowell Journal.

Coal for Steam Boats .- We learn from the Providence American, that the steam boat President, Tuesday at 4 o'clock, A. M. arrived at Providence ' My vineyard is situated between the Schuyl- the same evening at 11 o'clock. It is added that she used coal instead of wood on the passage and that the experiment proved entirely satisfactory.

The Directors of the Boston House of Industry

REPORTS

MASS. AGRICULTURAL SOCIETY IN 1830.

Continued from page 301.

To Be ajamin Guild, Esq.

offered by the Massachusetts Agricultural Society may be required, but I shall make an attempt, bany stage road, containing two hundred and fifty acres or thereabout. The soil alluvial and loam; which farm I purchased ten years since and for which I paid nearly 14,000 dollars. I have forty acres of good wood land, principally covered with the sugar maple. I have also in one square lot forty acres of meadow, almost perfectly level, and irrigated or overflowed by the waters of the Housatonic river, (by which it is bounded on the east,) in the spring of the year when the snow melts away, generally, and sometimes twice or thrice in a year, so that it never requires any manure, and I have nothing to do but to keep up my fences and cut the grass, which is all of an excellent, quality, consisting of herds or timothy, clover and fine English, and produces annually from eighty to ninety tons. This lot lies upon the east side of the road, opposite to my house and the residue of my farm upon the west side of the road, pretty nearly in a square form, a little elevated above the meadow, say 8 or 10 feet, and rises but little to the western extreme of the farm. I have an orchard lot consisting of about eighteen acres, which I mow, and obtain between (wenty and thirty loads of excellent hay. I have also moved five acres in another lot, which was seeded two years since, which produced five or six loads, making in all between 120 and 130 loads of first quality of herdsgrass and clover hav, which we have estimated at one ton to the load as we get in, well made, The residue of my farm consists of pasturage and tillage, say 147 acres, all good, which I bave improved alternately for pasture and tillage by a rotation of crops, first for wheat and rye, then corn, then oats or other spring grain with clover and grass.

I have improved it the present season as follows; of winter crops 12 acres of rye which was an excellent crop, but not measured, and two acres of winter wheat which was sowed upon corn butternuts, one ditto of walnuts, and one bushel of ground after the corn was taken off, and produced, as it was sowed rather too late, but 32 bushels. I have also raised this year 5 acres of oats, which produced 122 shocks, some of which we have threshed, which have yielded two bushels per shock; if the whole should yield in like manner, the five acres will give 244 bushels, or nearly 50 bushel per acre, upon which land I had beans and oats last year. With a little manure 1 also sowed one bushel of marzowfat peas, which supplied my family and several of my neighbors with green peas. I harvested eight bushels well dried and fine for seed. I have also on my farm two acres of potatoes. I have dug and got in one acre only, which produced 296 bushels, besides what were dug for use for several weeks,so that I can safely say that this acre yielded tending from the west end of my barn south 120 something more than 300 bushels of the flesh color, and worth double the common potatoes.

I have raised this season about 11 acres of corn over head. I have three or four other shee of the small early eight rowed ears which is a temporary or of less value. My barnyard is 12 very good crop, and will produce as determined feet square divided by a line of fence through the by a committee of an Agricultural Society, 90 centre each way, making four yards of about e bushels to the acre, that is, for three or four of the feet square, with a shed for each and a well DEAR SIR-On Saturday the 16th inst, was the best acres; for which they gave me the Society's water in the centre, from which I water each yar first time that I saw or knew of the premiums third premium. The land on which it was raised in each of which I have wintered about 100 shee has been moved for three or four years, and last and make my manure principally by hedding the for the best improved farm. I therefore shall be year broken up and hog-dung put into every hill, with straw. I have kept the last year two yol unable to make all the statements I wish to make, hills at three feet apact. My farm is divided by of oven and one yoke of steers, five cows at with that accuracy that is desirable and which a lane through the whole and fenced on either nine head of young cattle, three horses and of 1 side, and they divided into 10 and 20 acre lots colt and 425 first quality Merino and Saxo therefore offer my farm which lies in the cast part opening to the centre lane, so that I have more sheep. We have made butter and cheese on of the town of Pittsfield, upon the Boston and Al-than 6 miles of fence, a part of which is half wall, enough for family use. Although my stock

twenty acres of small white beaus which I have ceived this Society's first premium as the be not yet gathered, and which I estimate to yield fifteen bushels to the acre, or about 300 bushels in all. This field was planted two years since to corn and then to rye and oats.- I have ploughed and summer-fallowed twenty acres of old pasture where my sheep have run, and sowed it to rye and three acres more to winter wheat; all sowed about the last of August now looks finely, and if nothing befalls it, I think I may safely calculate upon thirty bushels to the acre.-The number of apple trees in my orchard is 149. Six years since 1 put in 1000 grafts by contract, principally of winter fruit, such as Greenings, Spitzenbergs, Gilliflowers, Russets, Golden Sweetings and Seeknofurthers, &c, &c, from which I last year made 36 barrels of eider and put up about 100 bushels o fine winter apples. To my trees I have done nothing but trim and scrape. This year, owing to a late frost I shall not have five bushels in all. My manner of making eider is the common way. As to saving grass seed, I usually seed down about 10 acres annually with 4 quarts of clover and 4 quarts herdsgrass to the acre. I have made several experiments. After taking off a corn crop, I have ploughed and sowed nothing but grass seed; this was done in the month of October, and it took well, but did not get to maturity fully the next season. I have also sowed with rye, in the fall and also upon snow covering wheat and rye, and also in the spring with spring wheat, rye and oats, and I am satisfied that to sow clover and herdsgrass in the next spring withouts is the best time and way. Another experiment may possibly be useful. Eight years since I ploughed and fenced about two teres of good land upon which I planted one bushel of chesunts, and smaller quantities of apples, peaches, pears, quinces, hazlenuts and filberts, most of which failed, save only a few peaches, severalchesnuts and filberts. The filberts I have transplanted near to my house, and have now probably 100 bushels which have borne considerably the two this year 140 acres, 17 of which has been seed last years, as large as any of the imported. The late frost prevented their bearing this year, but I have no doubt that they can be grown here plentifully with little trouble. My barn is 100 feet long and 40 feet wide, standing east and west, with a a few years since. Poultry in abundance, of ma floor through it lengthwise, over which is another floor, each twelve feet wide. Upon the south side of my barn I have a tier of stables extending the whole length, 12 feet wide, which is sufficient to put up 25 head of cattle. I have one shed exfeet, half of it 20 feet in width and the other half 14 feet, capable of holding 30 or 40 loads of hay

I have also raised this year two acres of spring cows are of the first quality, yet my family is lar rye, which I have not threshed, which I think will and consume all they produce; for one of n give me 20 bushels per acre.—I have also raised cows, which is only 3 years old, I last week r among 37 cows offered for premium; her calf no is only four weeks old, and she is a descendant the stock of cattle called the Gore breed, 1 b lieve from a bull imported by the late Govern Gore; at any rate, from my connexion with the Berkshire Agricultural Society, I was induced to purchase some of the finest cattle of our part the country, and for the ancestor of this cow paid \$100. My other cows and stock are of t Holderness stock. Of swine, I only keep and I enough for family use and some little surplus pay laborers. I am now feeding 8 of the By field breed, a part of which I think will weig about 300 lbs. each. As to the amount of lab for the last year I have hired only one man, at have two boys almost men; and in haying a threshing, day laborers, which in all probably co me \$140 or \$150 inclusive of board. I won also add that in consequence of tilling so mu land, I have hired 100 of my sheep pastured ! past snonner.

To recapitulate—

63 acres of meadow land

12 do, winter rye

do. do. wheat

5 do, oats

2 do, potatoes

11 do, corn

2 do. spring rye

20 do. beans

117

20 acres sowed to winter rye

3 do. do, to do, wheat

140

40 wood

70 pasture

It will be seen that I have moved and till down to grass.

My stock is as follows, viz. 425 sheep 20 he of cattle, 4 horses, 10 wild geese, and a few Inc geese, presented to me by Gorham Parsons, E.

This rough draft was drawn up last evening at this morning in much haste, and is imperfect f want of more time. Yet it is as I believe true.

I am, dear Sir, very respectfully, Your obedient humble servant, Pittsfield, Oct. 18, 1830 JONATHAN ALLEN. To be continued.

GYPSEM OR PLASTER OF PARIS.

nd the event answered his expectations,

e hay is better which is produced by it.

It is however said that Gypsum will not proote vegetation so much near the ocean, or in effects are not so visible any where in wet seaus. My own practice has been 17 miles distant [York for it, we buy that which was imported. om Long Island sound, where my first use of it, exceeded my most sanguine expectations,

In the spring of 1796, I sent to New York. d obtained a barrel of Gypsum which had been ported from France, and in May and June sowit on different soils, and several kinds of crops, d it produced wonderful effects generally. t some of it on Indian corn after the first hoeing.

d left 5 rows through the middle of the field ich was not plastered, which did not produce re than one, on either side, owing in some asure to the grubs having left the corn, where plaster had been used, and gone on to those ows, which some miles distant, looked like a d which had been cut through a wood, for the n was exceedingly poor, and from 20 to 50 bs under each hill, and not a grub to be found ler the hills which had been plastered.

The flax and potatoes were much benefited by ster, but the wheat, rye, barley and oats did not I w the benefit much; yet the grass was visibly beer some years after the crops were taken o ... The utility of Gypsum appearing so manifest iruced me to use it freely, and the next spring set corn, eider, &c. to Passamagnoddy and hought I tous. I used the greatest part of it the same yr. I generally put about 3 bushels on an acre athat time, because they used as much as that an acre in Pennsylvania, but 2 bushels are Lught now to be sufficient.

whim has gone abroad that it injures land. in the encyclopedists say that it does not, more the stable manure.

they have used it in Pennsylvania more than Syears, and still value it highly us a manure. It tury behind others in improvements, who have prices of grain, wool, fat cattle, &c. have improved. yet ventured to try it; but as it is now plenty the risk of trying it.

on the same lands will not find so much generally used the Gypsum oftener than once bushel to the acre.

planting, after soaking it awhile in tar water, the last season. - Hamp. Gaz.

which is made by putting balf a gill of tar into History informs us that the utility of Gypsum 2 gallous of water, or in that proportion, stirring or grass, was first discovered in Germany by a jit well, just to make the water a little sticky, and the horer at the quarry, passing across a meadow to plaster will adhere to the kernels much better, porten the distance home, discovered the luxuri- and the birds and insects will not meddle with nce of grass, where he had travelled, and imagin- | it; (too much tar may prevent - vegetation.) - Wcig that the dust of Gypsum from his clothes then put on from half a bushel to a bushel of plasmust have been the cause, tried the experiment, ter on an acre, after first hoeing, and the crop will generally be aloubled by using the plaster, unless Some time after, a keg of it was sent to Ameri. It be in a wet season, when the difference will not to Mr Jacob Barge of Philadelphia, and it soon be great; yet you may see where the corn hills were, me into use in that part of Pennsylvania, where some years after the land is laid down to grass. ey value it very highly, and even suppose that Some say it is best to sow a bushel on an acre of grass land every year, but its effects being visible several years, I have not practised in that way.

The Nova Scotia Plaster is not all of it equally by place where it can be decompounded by par-good or even that which is brought from France, des of sea salt. That may be so, yet it has some, but the imported is the best; yet the difference is nes done well near the sea in dry seasons, and not great, and as the Nova Scotia is the cheapest, consistence that will hold water longest without I generally use it, unless when we send to New

cal soon after grinding; or else it may become proving sandy and clay soils is to give to the forclammy and need washing or running through the mill again. Still damp weather is the best for sowing it, that it may not blow away; and it will sow better, and last longer; if it is not ground excessively fine. It may be sown in Spring or Autumn, but vegetation ought to have time to come forward before it is sown. Its effects will be most visible on land which has been recently laid down to herds grass and clover; but if it is mowing ground, it is best to mow it once before the Gypsum is put on, for fear it may make the clover lodge down, but the 2d year the herds grass will support it, much facility as potatoes. The Hon, J. Welles It is well to sow it as soon as the hay is taken off, thus describes his method, which we should believe for it will collect moisture, and keep the land from altogether worthy of general adoption. being parched from the intense heat of the sun, which is often the case at that season of the year,

not well be ploughed, though it will not do much the first year or two, yet the second or third year luxuriantly, especially after grain is taken off.

When clover seed is sown clear from the hull and it will keep it moist, and belp vegetation,-Middletown Sent.

Business.—It appears from the city papers that there is a great demand for vessels, and that the rates of freight have advanced more than 33 per cent,-Vessels have not been in so good request been used near 40 here, and yet we have for several years. The manufactures of cotton by farmers among us who choose to be half a and woollen goods are realizing a fair profit. The

The farmers of Hadley, Hatfield, and other cheap, I would advise farmers at least to towns in this vicinity are calculating to engage exhose who have used it plentifully and repeat- is believed that more acres will be devoted to this erop the ensuing season than in any former year, forked over, so as not to touch the roots. efit by using it again, as they did at first, yet Many acres in Northampton meadow baye been a good manure, even in those cases. I have leased to the growers of broom-corn. The price given for the use of good land, for one crop, if the , 8 or 10 years on the same land, unless it land be manured, ploughed, and made ready for the a little when the land was tilled, to roll planting by the lessor, is about 20 dollars per acre grain in, or a little to put on it, not exceeding and about 12 dollars per acre are given for the use

new busine garner.

BOSTON, WEDNESDAY EVENING, APRIL 13, 1831.

GARDENER'S WORK FOR APRIL.

In the Eastern States, generally, this is the month for sowing the principal garden crops. There is an advantage in sowing the hardier kinds of garden seed as early as the state of the soil will permit, as by that means the plants become firmly established before they are overtaken by the heat and drought of the summer. But a stiff and moist soil should never, on any account, be dug, ploughed or harrowed when it is so wet as to be claiming or adhesive. A light sandy soil however, will be benefited by being hood or otherwise wrought on while meist.

Mr M'Mahon well observes that 'earth of a becoming hard when dru, is that of all others the best adapted for raising the generality of plants It ought to be ground in fair weither, and sow- in the greatest perfection. The great art of immer such dressings of clay, cowdung and other kinds of manure, as will have a tendency to bind and make it more compact, and, consequently more retentive of moisture; and, to the latter coats of sandy earth, pond mud, horse dung, &c.

Asparagus may now be sown or transplanted, It has formerly been thought necessary to make a very laborious and expensive process of cultivating asparagus, but it has been found that the old modes of growing that valuable esculent may be dispensed with, and asparagus raised with about as

'A piece of ground was taken, of a deep rich soil. After a common corn crop was taken off. It is sometimes sown on old sward where it can- the land was ploughed and manured in the usual course. Holes were then dug, twelve to fourteen inches in depth, and about the same distance apart. it will show itself, and make the grass thick and and two or three shovels full of compost manure heavy, and continue to help the land several years, were mixed with a part of the earth. The roots It will do the most good on land which is in pretty, of a year's growth were then inserted at about six good order. It will not make poor land produce inches in depth. This bed has flourished and been thought as productive as any whatever. * * *

' However rare it may be that there is any over without covering, it ought to be rolled in plaster, eultivation or preparation of soil for any vegetable production, in would seem here to be the case. The old forms appear to have been kept up and to have discouraged a more general diffusion of this valuable plant.

'Dr Dean, in his husbandry, has somewhat simplified the matter, but not sufficiently. The proposed method of placing the roots at 6, 8 and 9 inches is quite too near. The duration of 10 or 12 years is quite a mistaken one; it lasts with us double that period.

'The management of the bed may be given in a very few words. In the fall of the year it is tensively in the cultivation of broom-corn, and it important to cover it with horse manure; in the spring it should be raked off, and the bed lightly

> 'If the bed from frequent weeding becomes low it may be raised with dock mud to advantage. This produces no weeds, while the saline particles are favorable to its growth. Where this cannot be had, rich loam may be taken.'

Mr Armstrong, in vol. 2 of the Memoirs of the N. of first rate land in its present state, that is, land | York Board of Agriculture says, 'It has been late-We have generably rolled Indian corn in it be which was well manured and hore a good crop by asserted, and with sufficient confidence, that a pickle of salt and water, of the ordinary strength flatulency,'

for preserving meat may be very usefully applied to asparagus beds in the spring. The effects ascribed to it are its stimulating power over the crop, and its tendency to destroy the seeds of weeds and insects, lying near the surface. Experiments on this subject should be multiplied, and with pickles differing in strength and quality.' In the last edition of Deane's New England Farmer, it is observed that ' to a bed fifty feet by six, a bushel of salt may be applied with good effect before the plants start in the spring."

Asparagus is thought to be a very healthy article of aliment. Loudon says, 'In Paris it is much resorted to by the sedentary and operative classes, when they are troubled with symptoms of gravel or stone. Willich's Domestic Encyclopedia states that, · Asparagus is allowed to promote the appetite; and affords a delicious article of nourishment to the invalid and valetudinarian, who is not troubled with

Dandelion. Leontodon taraxacum. This hardy plant might probably be improved by cultivation. Gen. Dearborn gave some notices of its successful culture, in the New England Farmer, vol. vi. p. 337. He observed that they might be set out at any time after the frost is out of the ground. I would recommend that the rows be three feet asunder, and the plants two feet apart in the rows.' And that 'the rapidity with which the leaves shoot out after cutting is greater than in any plant I have ever seen. Some of them were covered with flower pots, after the fourth cutting, to blanch the leaves for salad, and they are nearly or quite equal to endive. In five days after the pots were put over, the leaves, which had been previously cut close to the crown of the root, the plants shot up five inches in height.'

The culture of the dandelion is desirable on account of its medical as well as its esculent properties. A writer for the National Intelligencer, who appears to have been a medical man say, 'Dandelions have always been considered peculiarly useful in visceral obstructions, particularly those of the liver, when eaten eather as greens, salads, or taken in ptisans. - They seem calculated from their stimulant deobstruent powers to promote bilious discharges, and from long experience have been found highly efficacions in all biliary affections of the liver. They are also good to keep the body open and are dirretic and attenuant. In the dropsy, the dandelion has been known for ages to be of great utility. The ancients, says Willich, were better acquainted with the properties of this excellent vegetable, than those modern practitioners who appear to be more anxious to introduce exotics, imported from distant countries, than to ascertain the qualities of those numerous medical plants, which grow in our own climate. I advise all who are troubled with bile, flatulences, fulness of blood, and who are fearful of dropsy, vertigo, &c, to make free use of this precious gift of nature the dandelion.

EARLY CUCUMBERS.

large cucumbers, at the stall of Michael Tombs, Boston Market, They were raised by Charles Hovey, Cambridge-port.

Original Repartee .- A very intemperate man, whose face was covered with rum blossoms, insultingly said to a clergyman: 'do you know that I have got to be elder? 'No,' replied the elergy- about 6 years ago, we were so much troubled man, 'you look more like dog-wood.'

FOR THE NEW ENGLAND FARMER

BEES,

MR FESSENDEN-In August of last year, a gentleman from Kentucky called with a friend to see me, and observing I kept bees, mentioned that a friend of his in that state had for several years kept them in a dark room in one end of his garret, (a brick house) with some small holes cut through to admit the passage of the bees; by this means he was saved the trouble of hives and swarming (which they never do as long as they have room them. The bees appear perfectly satisfied with to work in,) and that he could at any time go into the room (properly guarded) and take 10 or 50 lbs, of comb at a time. Early in December, I wrote a letter asking many questions, with an intention of giving to your paper, the results of my inquiries, but presume, I did not get a proper direction, as I have not received an answer. During the winter I have made some inquiries, and reflected much on the subject, and herein give you an extract of a letter from T. W. Sumner, Esq. of Brookline, Mass.

'In the summer of 1827, a swarm of bees entered by a small hole under the shingled gutter which is on the top of the cornice of one of the dormer windows of my house; when in, they found abundance of room for working, and no one could disturb them, but by taking down the plaistered ceiling of my upper rooms. You will recollect my house has what is termed a gambleroof; the space above the level plaistering, forms a flat triangle, of 7 feet wide, twenty inches high and at least 60 feet long. I think had they not been disturbed, they might have worked twenty

"We did not disturb them, neither did they disturb us, till I took them up in January, 1829, on a very cold day. I took down the plaistering about a yard square under the comb and smothered them in the usual way with sulphur. We got 296 lbs. of comb, bread and honey. I have often regretted I did not try to propagate them, for honey in a family is a very convenient article,'

A friend of mine as much as 15 years since, in taking a house to pieces in Boston, found a swarm of bees over one of the dormer windows in the garret, which he had carefully sawed off and secured and carried to Brighton, where he kept it several

I understand there has been in the roof of a house in Brighton a swarm of bees for 7 years past. They have not had much room to work in, but will not be driven away.

All these circumstances had determined me to prepare a place in my barn, when your paper about a month since stated it was a common practiec in Ohio.

I have made a tight closet of near 10 feet square and about 6 feet high in the centre, at the southwest end of my barn, immediately under the ridgepole. The floor is about 25 feet from the ground and is approached by a fixed ladder from the second floor, and kept under lock. In this I have On Saturday, the 9th inst. we noticed several placed two hives purchased last season from Mr Beard, from the interior of Maine, where as I understand they have not been troubled with the bee moth. I apprehend from the great elevation of my bee house, I shall not be troubled with them again, as I believe they do not often rise so high from the ground.

I have kept more or less bees for 20 years; till by the bee moth that I gave them up. Last year cently passed southwesterly from Springfield.

I began again in the hope, with some of the improved hives to succeed better, and still intend keeping some in the usual way near the ground. If the chamber plan succeed, of which I see no reason to doubt we shall be saved a great deal of trouble, as we shall no longer be obliged to watch and hive them. I have put in some extra rafters. also a shelf and standards, to enable the bees more readily to attach the comb.

Any persons baving a wish to see the method adopted by me, I shall be happy to shew it to their elevated situation.

I am somewhat apprehensive that a southwest aspect may be rather too warm in summer, and rather regret I had not put the room even at the northeast end of the barn. I should have preferred a southeast front, taking the morning sun and being cooler in the afternoon. I do not think there is any danger to be apprehended from severe cold, if they are only kept dry.

Very truly yours, JOHN PRINCE. Jamaica Plain, April 11, 1831.

Instead of remitting silver to China in exchange for teas, we now begin to receive thence, remittances in specie for our domestic goods. We find the following paragraph in the New York Journal of Commerce:

' The Tide Turned .- The brig Delight, at Phila delphia, from Canton brought \$24,000 in specie. A letter states that half a million has been recently exported to Europe. If China is to disembogue its silver upon the western nations, while the usual supply from Mexico and South America contimes, the effect will be to make the article a greater drug even, than it is at present. And it is already the dullest commodity in the money-market. Any good paper is preferred before it.

Brighton Market-Monday, April 11

[Reported for the Chronicle and Patriot.]

At Market this day 279 Beef Cattle, including 72 unsold last week, 19 pair Working Oxen, 50 Cows and Calves, 12 Stores, 351 Sheep, and 220 Swine; 50 Beef Cattle remain unsold.

PRICES .- Beef Cattle-Prices were more under than last week, but probably not much variation in the whole, we shall quote the same from 4 50 to 5 25, extra at 5 50 a 5.75

Working Oxen-We noticed the sale of 8 pair, none of which were for less than \$55 and none for more than

Cows and Calves-We noticed the sale of one at \$12, five at \$15 each, and at 19, 20 and \$22.

Sheep-We noticed 2 beautiful Cossett Wethers from Westborough taken at \$12 50 each, one lot of about 60 at 5 871, and one lot at \$6.

Swine-The whole at market were taken in one lot at 43e. after which a few were retailed at 5 for sows and 6 for barrows.

MISCELLANY.

From the Massachusetts Journal and Tribune.

MRS. HOOD'S REPLY

TO MR HOOD'S LAMENTATION, 'I'M NOT A SINGLE MAN * Caltean.—You taught me longuage, and my profit on't Is I know how to -- Pun. '-- Tempest.

I WILL not fiet, though you regret You made me your's for life; But yet I find that all the heaux Remember I'm a wife, Your winks and wiles, and wreathed smiles From them have set me free. But your winks, alas, good Mr Hood, Have fairly Hood-winked me.

You 've changed my name, but I'm the same In face and disposition, But at the altar to my cost I altered my condition. To catch my eye, beaux once would fly Where'er they knew it shone, To watch it's beams-but now it seems

I at the parlor windows sit To eatch them unawares, But they wont even stare at one Who is not above stairs. My lovers trembled when they sung Of Love, that weeps and wakes, Their tremors all have ceased, and I Now find them no great shakes.

A beam is in their own.

My veteran beau, old Mr Stubbs, Though bald, in thyme would caper; Both carls and wit o'er night for me Committed were to paper. My reign is o'er, and him no more Do wigs or rhymes employ; He's now abandon'd the old scratch. And looks like the Old Boy,

With billetdoux of every hue, By seals with quaint expressions, Beaux strove both on the wax and me At once to make impressions. But their epistles come no more The tale of love to tell; Their letters now I know are joined For another sylla-belle.

Bouquets once came the ardent frame Of Lovers to disclose, And many a tender line was sent All underneath the rose. But verse inclosed in roses now Appears not, though I ask it; And all the tender lines I get Come in a market basket.

The fate of both of us is hard, Which hardest, none can tell-I can no longer tie a beau. You cannot ring a belle. But still I do not like to hear Forever from your lip, That from the hour you got a rib, You've always had the hyp.

You can't imagine, Mr Hood, That when the knot was fied Your heart was ticensed, like the mail, To carry six inside. Nor wonder yet the fair forget The claims you bring to view, The reason's plain they cannot see A likely-Hood in you.

To me your dame, you are the same, Your wit and humor's free, For I've no fear you'll ever prove A false-Hood unto me. And since you taught me how to pun And took the marriage vow, I'll say though I was singly blest, I'm doubty happy now.

Aucient Desterity .- One of the early kings of Egypt being desirous to secure his riches, commanded a treasure-house to be built; but the architect, intending to have some share of the treasure, instead of finishing the building completely, placed one of the stones in so artful a manner that it could be taken out and put in again by one man. As he was prevented by death from accomplishing his design, on his death bed he gave full instructions to his own sons how to execute it. After they had for some time plundered the treasury, and carried off large sums, the king who observed the gradual diminution of his wealth, without being able to discover how the thieves had access to it, finding his seal upon the door always whole, ordered several strong traps to be left in the treasury. By this means one of the brothers was at last taken; but, finding it impossible to escape, he pressed his brother to cut off his head, and retire with it to prevent any discovery. The king next morning examining the success of his project, upon finding a man without a head in the snare, hastened out in the greatest alarm and confusion, he ordered the body to be exposed on the outside of the wall to the public view, charging the guards placed round it to observe the countenance of the spectators, and to seize those who appeared sorrowful. The surviving brother, urging by his mother's entreaties and threats of exposure, formed the design of carrying off his brother's body. Accordingly driving has asses tinther laden with skins of wine he found means by the stratagem of letting his wine run out, to intoxicate and stupefy the guards. When they were in a deep sleep, he shaved the right check of each of them, by way of derision, and in the night carried off the body on one of the asses. This action still more astom-hed the king; who being now more earnest to discover the thief, ordered his daughter to receive the addresses of all suitors promiseuously, on condition that each should previously confess to her the most ingenious action he had ever managed, and the greatest crime he had ever committed. The young man resolving again to perplex the king, went to the palace of his daughter, and confessed to her that he had cut off his brother's head, and afterwards carried off his body. When she then offered to lay hold of hun he stretched out to her the arm of a dead man, which he had carried in under his cloak (suspecting the intentions of the king.) and, while she had the cul-prit, he made his escape. The king's resentment being now converted into admiration, he promised a pardon and rewards to the person who had robbed his treasury, if he would discover himself. The young man, upon this proclamation, immediately made himself known; and the king thereupon accounting him far superior in dexterity to any man then living, gave him his daughter in marriage.

In these days of selfish calculation and heartless policy, it is refreshing to meet such sentiments as the following by Mrs S. C. Hall- 'llow beautiful, how sacred, are the feelings of affection in pure and guileless bosoms! The prond may sneer at it-the fashionable may call it fable-the selfish and dissipated may affect to despise it-but the holy passion is surely of heaven, and is only made evil by the corruption of those whom it was sent to bless and preserve.

Self Illustration .- In the Jamaica House of Assembly, a motion being made for leave to bring in a bill to prevent the frauds of wharfingers, Mr Paul Phipps, member for St Andrew, rose and said-'Mr Speaker, I second the motion: the wharfingers are to a man, a set of rogues; I know it well; I was one mysetf for ten years.'-Mirror.

Fontenelle boasted in his old age, 'J'ai quatre vingt ans ; je suis Français ; et je n'ui pos donne dous toute la plus petite ridicule à la plus petite verlu.' ('1 am eighly years old, I am a Frenchman, and through the whole I have never thrown the smallest ridicule upon the smallest virtue.') This was indeed a proud subject of self-gratulation .- Tweddell's Remains.

Vuluable and Cheap Land-for Sale.

The subscriber offers for sale, 14,000 acres of choic Land, situated in the town of Pinckney, county of Lew and state of New York. Some of the land is improve and under cultivation. The country is remarkably hea ton, being entirely free from the lever and ague and from the common bilions fevers which often afflict the town upon Lake Ontario, this town being 18 miles east of th Like. The soil is principally a sandy main, much of a covered with rich black mould. The timber is chiefl Sugar Maple, Black Ash, Butternut, Beech, Elm, &. The land yields first rate crops of Grass, Rye, Oats, Bar ley. Potatoes and Fiax; and on some lots, good Whea and Corn may be grown. To those wishing to obtain su perior grazing farms, a fine opportunity now offers itself The produce of pasturage and hay from an acre of thi Land, is very large, fully equalling it not surpassing tha from the same quantity of land in any other of the Blae' River townships The land is admirably well watered there being but lew lots which have not durable running streams upon them. The land is well adapted to Orchard ing-the Apple tree thriving very well in this county Stock of all kinds may be disposed of with the least possi tile trouble, and to the greatest advantage, the drover purchasing at the very doors of the farmers, and paying the highest cash prices for their cattle, which will readily find purchasers at all seasons of the year. Several far mers at present residing on this town, were originally from the New England States, and some of them from Massachusetts, who are in thriving circumstances. The above described land is offered for sale at the very low piece of fron two dollars and a half to three dollars per acre, for the uneigned land, and from three dollars and hait to five dollars and a halt for the improved lots. The hand will be sold in lots to suit purchasers, and from two to five years' credit for payment in annual instalments will be given. As a further convenience to purchasers the subscriber will receive in payment, Cattle, Sheep Perk, Grain or Grass Seed, for which products he will allow the highest eash prices. The title to the land is indisputable, and good. Warranty Deed, will be given to purchasers. Persons desirous of purchasing will please to apply to the subscriber, at Henderson Harbor, county of Jefferson, State of New York, or to DAVID CANFIELD, Esq. on the town. JAMES H. HENDERSON. March 9. ep16t

COMMANTORATIONS,

FOR THE NEW ENGLAND FARMER.

BEES.

ir wings to circulate the air. They found they bees, but, perhaps, they would be too large for re too numerous to do this, and of course made pees raised in this quarter. ush for the doors, this I found to be the case, I have bees from Maine, and one swarm in my de under such a heat to ferment, so as to increase of March, I transplanted this melted hive of are a great many bees lost for want of bee-bread. s into one of the hives, which the bees had left, thing that the hive which they were in would prove a good one for them to breed in this sum-. I took the melted hive and sat it on the und in front of the bench, and set my other on the bench, where the melted hive had id. Then turned the bottom of the melted hive vards, took off the bottom board, split down the young bees were hatching out.

discovered on these combs a bee like the comlaboring bee, but larger, and so clumsy that y all had stings. Where were Mrs Griffith's nes that vivify the young at this time? for you no drones at this season of the year; and still rout drones they are manufacturing their fam-

I will thank you, Mr Editor, to tell the public ere the drones are bred. And if you believe a queen and a drone can give birth to a differspecies from themselves, or make a honey-bee a sting.t

CONSTRUCTION OF HIVES.

In answer to a writer for your paper, with the signature ',1 Countryman' [N. E. Farmer, vol. ix., p. 283,14 would observe that by experience in the management of bees, I have found that in an old MR PESSENDEN .- I will trouble you with my fashioned hive the contents are thus arranged, viz. ggestions on the bees which I had melted down.* In the top of the hive is the white honey and in in the 16th of last January this hive of bees was the middle is the bee-bread, and dark honey, such ought from Maine, with one hundred and seven- as the bees live on in the winter. In the lower five others, and stowed away in the hold of the part, or bottom of the hive is the dry comb, such ssel; and from the time they were stopped up as the bees breed in, and summer in. Finding it Maine, till they came to Charlestown was about thus arranged, I have, in my new fashioned hive, nonth. This was in the mouth of November, and made a ceiling one third of the way down the have course was warmer than it w s when they were so as to take in the white honey. In the ceiling sited down. The cruse, I think, was that after are two small cracks, and in these cracks, I have by came to Charlestown, and had been opened, shdes that fit them. When you wish to take the e or two swarms of bees left their hives and honey, you enter these slides, and then take out ant into this one, and this being a small hive they the top boxes, four or more in number, as the size ed it full, so that in moderate weather they came of the swarm may require. But, whatever fashiont and covered the hive on the outside in front; ca hive you use, be careful to have the part I in cold weather the hive was full of bees, I which the bees breed in and live in large enough. s obliged to crowd the bees which were in the I' you do not you will be apt to rob them of too ors, to get the stoppers in. In excluding the air much of their food, and not leave a place large bees became heated, and, as their practice is, shough for them to winter in and breed in; my case they are too warm, they set a buzzing with tives, I think are of a good size for the Maine

when I opened the door they pushed out in lossession, which last fall weighed three pounds, rents; I think therefore that the numerous body nees and comb. By the use of boxes and slides, bees, being so crowded together, in attempting [have got them in good order, I took honey comb, nove became heated, a fermentation took place full of honey, and bee-bread, mixed together, and he bread and honey which compose their food; put into those boxes, and put them in the top of only in the combs, but, I am of opinion that the hive, and then drawing out the slides, let the honey and bread which the bees had eaten were bees pass up into these boxes and feed upon the lark honey. This spring I have given my bees heat and cause the combs to fall. On the 6th hearly half a barrel of bee-bread, I believe there

If the young swarm is put into a hive with loxes on the top, it is necessary to have it so constructed that the separation may be perfect, the white comb not adhering to the dark; and if the passage way for the bees to ascend into the top poxes be made right, you will have no young bees nor bee-bread in the top boxes. When my bees become a year old I enter my slides, and take the s of the hive, and found that the bees had re- boxes out until the 20th of Junc. Then they will nufactured their combs, had got the hive half have swarmed twice if a good season; and after of comb, had put their honey in the top of ;hat I draw my slides, and receive the bees into the hive, had laid their eggs below, and some of top boxes, and from that time to the end of the season you will generally obtain one set of boxes from the old swarm, and your two young swarms.

With regard to the question whether it is best to ould not fly, in the act of laying eggs. I kil- buy an old swarm, I consider that for breeding, some of them, and found in their bodies whit- a swarm one year old is best. But, if you have matter like the eggs, which I have found in the an old fashioned hive let them remain in it for om of the cells. These were not queens, for breeders; until they become so old as not to be good for breeding. Then drive them into a new hive about the first of June. If you wish for more concerning bees I shall, with pleasure, inform you, as far as in my power.

Yours, with respect,

EBENEZER BEABO.

† By the Editor.—There is, perhaps, no subject in the whole circle of science, which is enveloped in more obscurity than the natural history of the honey bee; partic-See New England Farmer, page 259 of the car- ularly the mode by which the species is continued. The volume.

queen bee is the mother of all the inhabitants of a hive viz. succeeding queens, working bees, and drones opinion, however, is not compatible with Mr Beard's statement of his having found on the combs hees like the common laboring bee, but larger, &c, in the act of laying eggs. Of these it seems there were a number, for Mr Beard 'killed some of them.' If Mr B. has not been deceived by some of the managives of these little conjurors, the queen bee has no exclusive right to the honors of maternity, and is not the sole parent of her people. But, perhaps, the bees which appeared to Mr. Beard to be depositing eggs were in fact laborers feeding the larvæ in their cells. Conjectures, however, can establish nothing, and we beg leave to refer this subject to some of our friends, whose pursuits and investigations may best enable them to explain its mysteries.

FOR THE NEW ENGLAND FARMER.

QUESTIONS RELATIVE TO THE MANUFACTURE OF CHEESE.

MR EDITOR-If the manufacturers of good cheese would answer the following inquiries, no doubt it would have a tendency to lessen the quantity of bad cheese, and greatly benefit our country.

- 1. What effect has it on milk in hot weather, if it is much agitated and heated in the udder by the cow's being driven a long distance, or running about?
- 2. Which is the best method to keep milk sweet over night in warm weather?
- 3. Which is the best method to preserve rennet skins?
- 4. What quantity of new cheese will one rennet skin prod · · ?
- 5. How many quarts of milk (milk measure) will produce card for a cheese which will weigh 15 lbs, from the press?
- 6. What will a cheese which weighs 15 lbs, from the press shrink the first 6 months after it is
- 7. What degree of the Thermometer should be the heat of the milk when the rennet is put to it?
- S. What is the effect if the milk is too hot when the rennet is put to it?
- 9. What is the effect if the milk is too cold?
- 10. How long time should be allowed after the rennet is put to the milk, to cause it to turn to curd fit for the knife?
- 11. What is the effect if the curd is stirred or broken too soon?
- 12. What is the effect if too much rennet is put to the milk?
- 13. What is the effect if too little rennet is put to the milk?
 - 14. What kind of salt is best for cheese?
- 15. What quantity of salt should be put to card which will make a cheese weighing 15 lbs. from the press?
- 16. What is the effect if too much salt is put to the curd?
- 17. What is the effect if too little salt is put to the curd?
- 18. What is the effect if cheese is not sufficiently pressed?
- 19. Why does American cheese dry sooner than English cheese when it is cut open?

CHEAP ROLLER

Mr Fessenben-The roller described by Mr Phinney in your last volume is an excellently well constructed one, but those who have no old carts and wagon wheels on hand with which to make [1829] by a gentleman in Dennis of soaking seed one formed of a but of timber 20 inches in diameter, after being rounded by rule by a carpenter, would be better if larger, and 31 feet long. The shafts for a horse are made of 2 pieces of scantling in the end of each to receive an iron gudgeon 3 of an inch diameter, which is driven into the centre of each end of the roller; a board for a scat crosses immediately over it, and rests on a rising from each shaft, and the feet of the driver rest on the draw bar; thus the weight of the driver is added to the roller, and 2 or 3 may ride, and a boy of 10 years old has rolled several of my fields this spring of 4 to 5 acres, in a half a day each, taking the whole field, or at least the half of it, at a land. This length moves very little if any ground in turning. Your most obedient, Bridgeport, Con. April 5.

THE EFFICACY OF COPPERAS ON SEED CORN DOUBTED.

I prepared some seed corn with copperas so strong that my planter declared it had made his hands so sore he could not hold his hoe handle, and refused to use any more, leaving about half a peck. which when dry was the color of copperas; I gave some to a lame cock in the door yard, where the other fowls were not admitted, and seeing no bad effect, I gave it toall of them without perceiving any bad effect.

I planted some of it in the garden, and out of about 30 hills there were 5 or 6 stalks affected as if by a worm, but I did not see the insect and therefore cannot say what kind. I do not know that there was any difference in the field,

Bridgeport, Con. . Ipril 5.

Remarks by the Editor .- We should be sorry to learn that a recipe so often and so strongly recommended by practical farmers as that of copperas water for preserving seed corn against worms, birds, &c, should prove unavailing. We wish, however, that the truth may be ascertained, and will as readily publish facts against as in favor of the use of the solutions we have so often recommended. In an article in the third vol. of N. E. Farmer, published in 1825, we mentioned that Dr Deane had advised to use a solution of copperas as a steep for seed barley and proposed its trial for seed corn. A correspondent, who signed '. I Subscriber', and dated, Gloucester, March 18, 1826,' whose communication was published N. E. Farmer, vol. 4, p. 284, states as follows: From an article which I observed in your paper I was induced to try the experiment there recommended, to soak my seed corn in copperas water before planting. It immediately struck me that it would have a beneficial effect. tried it and the result was fully equal to my most sanguine expectations, &c. The same volume, page 395, contains an article, copied from the Hampshire Gazette, which states that Mr Ralph stock, as his yard fully evinced at the sale last fall, Owen, of Belchertown, in May last, planted 3 or 4 acres with corn, which had been soaked in copperas water; the seed came up well and not a plant was of great promise, and I should now be proud to destroyed by worms. An adjoining field, planted show him to him! with corn which had not been steeped was very much injured.

The 8th vol. of N. E. Farmer, p. 355, contains the following article, copied from the Barnstable Journal. An experiment was made last season

one, may dispense with its use for want of some-corn in solution of copperas, from 24 to 40 hours thing more cheap and easily constructed. I have previous to planting, as recommended in the N. E. Farmer and in Fessenden's N. E. Farmer's Almanae the careless and unobserving, yet it is a fac-The corn thus soaked was untouched by worms, while some planted on the same piece in the common way was very much injured. A Connecticut farmer of suitable size for that purpose; a hole is bored has made a similar trial, and says that it was not only untouched by worms, but yielded one third more. A pound of copperas dissolved in warm water is to be used to a peck of corn. We have likewise received many verbal accounts of the efficacy of this preparation,

It may be recollected that last season was uncommonly wet and it is possible that the copperas (upon their keeping, or the produce raised upon sucl with which seed corn was impregnated might have lands; while the good land makes up for ever been extracted by moisture after the corn was plant- deficiency, or at least so far warps the judgmen ed. The solution is not poisonous and can oper- of the nuthinking breeder that he plumes himsel ate as an antidote to insects and birds only by mak- upon having stock superior to his industrious ing the taste of the grain disagreeable to those depre-neighbors, while the merit consists in the goodnes dators. But facts on this subject are still wa ded, of the land and the richness of its pasturage and for if the preparation be useless it ought to be laid produce. Satisfied with his stock being the larges laside; if not further proof of its utility is desirable, he also concludes they are the best; while his

SCOURS IN CALVES.

I will add a sure remedy against that dread to all breeders of cattle, the scours; especially affecting young calves ;-the use of a little pulverized All young calves are subject to this disorder, especially if brought up by hand, and even on the This malady has been the greatest difficulty in raising calves by hand of anything, I ever met with. Perhaps you may have noticed it before in your useful paper. If so, it may be acceptable a second time as coming from a breeder, who makes this statement from actual experiments. It is simple, cheap, and within the reach of every breeder at a trifling expense. I would ask the question whether lime thoroughly water slaked, would not be a good substitute for chalk, and answer the purpose equally well?

IMPROVED BREED OF CATTLE. The Cow, named in my circular is the same

which you have before mentioned in your paper. She was imported by G.W. Featherstonhaugh, Esq. Admiral, the young Bull presented by your worthy townsman, and public benefactor, the Hon. Jour Welles is a noble animal. At a year old be weighed 788 lbs. I shall have him weighed again this spring and will send you an account of his weight. His proportions are just-figure admirable. Mr C. H. Hall of Harlem, near N. York, a celebrated breeder of fine stock, who has imported many fine animals, made me a call last fall, and reviewed my stock. He at once declared young Admiral to be a noble animal, fully equal to any he saw in England, and superior to Wye Comet, Mr Powel's famous bull. Mr II, is a man of nice judgment in fine and it was gratifying to me to have the opinion of such a man. Mr Welles remarked that he was a calf

' You will excuse the freedom I take with you, but I am the more particular on account of the Hon. Mr Welles, to whom I am under great obligations.'

REMARKS ON LIVE STOCK.

Concluded from page 291.

Though it may seem very extraordinary t well known to the attentive breeder, that i general, all our best and most valuable kinds of stock are found upon the middling and wors grounds, and not upon the best lands as we shoul naturally imagine; and the reasons that it is so, ar simple and obvious; -those breeders who occup the middling and indifferent tracts of country are under the necessity of producing an indus trious and thriving breed of animals, because a large, tender, big-boned kind could not subsis more active and industrious neighbor, from being Extracts from a lotter from L. LENKINS, Esq. of Canandaigua, N. situated in a less fertile soil is obliged to seek on Y. to the Editor of N. E. Parmer. for a hardy thriving breed.

I will beg leave to remark on beef and muttor exposed to sale in pieces on the shambles of stalls. When we consider that the differences between what is called the coarse and fine or chalk in any mess. I have used it with success, the best and worst parts of beef, when cut ap is not less than one hundred per cent, of what vast consequence then, must it be to the breeder cow I have known them to be greatly injured by to propagate those cattle that have the greatest it especially when the ground was covered by snow, proportion of those valuable parts and always feed in less time than the big-boned, coarse sort.

But it is not so with mutton; the difference i value between one joint and another is scare worth naming. In different parts of the kingdon they give the preference to particular joints; but the variation is seldom more than a farthing, or half a penny per pound at most. Nevertheless is is still right for the breeder to pursue that species which pay most for what they eat; and these I apprehend will always be found to be the small boned true formed sheep, for they not only produce the finest grained mutton, but more of it in a given time, in proportion to offal than any other sort of sheep I know of. But in speaking of offal here, I would be understood to include more than what the butchers generally do. By offal, they mean hide and tallow, only in neat cattle, or skin and tallow in sheep, and so on; but by offal in this place, I would take in not only hide or skin, and tallow, but bones, horns, pelts in sheep, blood intestines, and even wool and hair.

Suppose two bullocks, or two sheep are fatted together on the same food, the one remarkable for coarseness, the other for fineness, and admit that the coarse one cats only as much as the other, though I have no doubt of his eating more, still as a considerable part of his food must go to the support of more hide or pelt, bone, &c, while the other's food is principally converted into arimal flesh; which flesh on an average call only worth 3d. per lb. I am afraid the horns, bone, pelt, &c, are not worth above a farthing per lb. consequently a very great loss to the community. Indeed the hide of a bullock is sometimes worth as much per pound as his flesh, and particularly firm strong hides what are generally called leather hides are worth more; but then these very thick hides most generally cover a very slow feeding careass; and

See N. E. Farmer, vol. viit. p. 334. † See N. E. Farmer, vol. viii. p. 74.

ore valuable,
On tallow. ide, they excel those that have more fat within pense, exact proportion as they pay more in a given ie, for what they eat.

isequently no excellence, but the contrary.

allest, cleanest, finest bones, are in general the pletely protect them through the winter, st grained meat. I believe they are also the liest, heaviest, and most inclinable to feed, to bear the most fatigue while living, and th the most per lb. when dead,

My mode of training, as far as I am aware of it, is entirely peculiar to myself, and as regards fitness and economy, (taking the average of a given number of years) I think is superior to anything I have met with. I take chesnut posts, the thickness of large fence rails, seven feet length. These I plant along the rows, at distances of ten feet from each other, and at such a depth as to leave five feet above the surface of the earth. Then taking three nails to each post, and driving them to within half an inch of their heads,-the first all rather detail what I would do, than what I two and a half feet from the ground, a second done. I think the plan laid down by most midway between that and the top, and the third ers for preparing the ground and planting, is near the top, I attach No. 11 iron wire, (one deh more expensive than is necessary, and that gree soft is best) firmly to one of the nails in the calculated to deter many persons from under- end post, pass on to the next, and stretching it ag the business. To dig the ground from straight and tight, give it one turn round a nail in teen inches to two and half feet deep with a the same line as the one to which it was first le, is in this country no triffing task, and in attached. Having in this manner extended it parison with the common process of farming, along the three courses, the whole length of the s truly formidable. My plan would be, to row, my trellis is formed. I have had a portion of two ploughs with strong teams, one immedial my vineyard fitted up in this way for three years, behind the other, in the same furrow, each of and experience has confirmed the superior fitness a set deep, and after the ploughing is complete of the plan. It is not its least recommendation, harrow it thoroughly. Then, in the direction that it possesses in a degree the character of 'larows are intended to be planted, run parallel bor-saving machinery.' A very important and exows across the field, at the distance of eight tensive labormaking portion of the operations in from each other. Afterwards cross these at the vineyard during the summer, is the attention t angles, five fect asunder. AGRICTLETE.

From the Massachusetts Agricultural Repository.

WOODLAND AND FOREST TREES.

To the Corresponding Secretary of the Massachusetts Society for Promotings Agriculture.

From a variety of circumstances, my attention for a series of years has been necessarily drawn to the oversight of several considerable tracts of wood land, in order to effect a right management of them. This attention has become a habit and a source of gratification to me. If any apology is due for the too frequent remarks on this subject, I must refer to the partial persuasion of my friend Mr Lowell, whose valuable instructions and labor as to the forest, as well as the garden, have been so useful. On the right management of the wood lot, our agriculturists have been heretofore again and again inquired of, and it is most obvious that many opinions offered have been erroneous. Some of these will be stated, to show the knowlege aimed at by the society. It will be our endeavor to submit facts and inferences, drawn from repeated experiments and more intimate experience which time has afforded. These may be useful so far as they are sustained by the judgment or coincidences in the opinion of others. The first question on this head submitted by the society is: Whether the growth for wood for timber and fuel, be equivalent to the consumption in your vicinty? 7 The universal reply has been indicative of an alarming decrease in Massachusetts, of both timber and fuel, and that a recurrence in the country is had in many places to peat, as a substitute for the latter; while recently it is well known, that in populous places, and near the sea coast, as well as in many of our manufacturing establishments, there is an increasing and extensive use, particularly of the coal of our country, as a substitute for the article of wood. Nor is this to be regretted; on the contrary, it seems most wisely ordained, that while the discoveries of the age call for an increasing use of fuel, as to which the surface of the earth could give us no adequate supply; there are beneath us and at hand, inexhaustible resources for every possible demand. It is not to be denied, however, that these are but substitutes-and very inconvenient ones in many places; nay, more, that they are generally recurred to from the force of necessity. To most of those long habituated to it, the cheerful blaze of a wood fire, has a powerful attraction. But if wood is abandoned for fuel, and no means of encouragement are given by government, whence is our timber, &c, to be derived? Here against future scarcity, the inroad, or browsing of with great respect a consideration is submitted to our legislators, which, though familiar to many may not, as to its effects, be so well known to all, By a law passed March 4, 1829, it is enacted, 'That all wild or unimproved lands, shall hereafter be assessed at six per centum instead of two per centum, on the value thereof !!?

Excesses in legislation are apt to operate injuriously, especially, when they effect changes in long established usages. The effect has been herein sudden and violent in its operation on farmers. Feeling the threefold weight of the tax, thus increased upon a capital not immediately productive to them, they have laid the axe to the root so heartily, that wood at 12 to 20 miles from Boston, has actually deen depressed in value more than one third, and timber is of little more value than for family of children, it was set about in good earnest, and fuel! This was probably unforeseen by the legislature, and is to be lamented. But it will meet the hand since !

inquiry has been, 'what measures are taken to prevailing usage with them, of 'cutting clear,' provide against the inconvenience of future scarof the sprouts from the stumps of late fallen trees,' but it is well to note what time has confirmed. In fact, unless there is a surplusage of young shoots cropped!

lately made. On an Inclosure, partly of good as well as the benefit of cutting clear. pasture land, in a spot the most retired from cultivation, on the north side of a rocky precipice, where long gone by, to pick out the trees as wanted, for there was not a blade of grass, and at some distance timber, or fuel, and the growth had become very from grass feed, about ten loads of wood in scatter- scattering, and of no sensible increase; though ing growth, on about an acre of ground, were cut most of them were of white oak, and from an off. Some young bushes and the brush were left cient growth and great size, had become very on the ground to discourage the approach of cattle. valuable; yet when the lot was again cut over To furnish sprouts or browse and to ascertain how there were more cords of wood, and a greater far cattle would be induced to crop the shrub oak, profit in the latter, than in the former case, The an acre or two of young growth were cut over, The latter were very sparingly resorted to-while latter of only thirty years!! I was unable, with the assistance of two persons, to find one sprout of the walnut, oak, and other as might be done, on this head. trees, untouched by the cattle,

all the shoots of young forest trees which they can wood lots, and the best means of production for reach, constantly tempted by their sweet sap; thus fine? — as to our timber, there is no great scarcity discouraged and gradually destroyed, they give at present; there seems to be enough to meet the place to bushes and shrubs, which instead of demand. But the principles of production, are affording nutriment to cattle or being advantageous to the husbandman, make the soil not merely use- is said, to endure long, must be matured by age, less, but an occasion for heavy expenditure.

recently cut over, by browsing, will be stated, First, a tree or sucker thus deprived of its man shoot, it is said, never grows straight, or becomes a timber tree, and its thrift is injured.* Next, if the trees are cut in the proper season, when the sap is said to be down or the leaf is off, in the following spring, the circulation of the new system then puts forth its effort, strongly for the needed action of the atmosphere, by the function of its leaves, &c. If this is not afforded, vegetative life is endangered, if not lost.

For these and other reasons which will follow in connexion with this subject, it is apparent, that as relates to both of these questions, the forowth of wood and timber'-or the means of provision, cattle, must be prevented.

The next question presented is, 'in getting your wood for fuel, do you pick the oldest trees, or do von cut clear ?

The reply from individuals, as well as societies, mostly given is, 'It is generally practised to cut very thick growth, almost fit for the axe! It will the oldest and most decayed trees, leaving the be said that there must be a period of decay in rest.

Our belief is, that our farmers have attained a

I forcible demonstration of the power and the healthy functions of the leaf, and the effect of their los, may not be thought out of place here, besides being somewhat analogous. Some years since, a tract of pasture land, about 15 miles from this city, appeared to be overrun with Sumach, (Rhus tophinum) so useful as a dye stuff. A worker in morocco urged the occupant to gather the leaves and dry them at \$20 a ton. As there was a large over five tons were gathered and paid for. It is not believed that five pounds of this material have grown on this

attention it merits, from the watchful guardians of better knowledge and practice, and that both ex the interests of the commonwealth. The next perience and observation will well justify the now

Where old and decayed trees only are selected city.' To this, the answers given are much to be the growth becomes more and more scattering regretted. In most instances, the replies are, and the young trees or suckers, deriving no vigo the wood lots are not fenced from the habit of from the sun and atmosphere, fall into decay economy and other motives, and where cattle run. This remark, with some others, may perhaps be at large on the commons, they cat and destroy most deemed a repetition of what has been before said

The cutting of two growths on several lots since and but very few eattle to browse, the whole are the period alluded to, has passed under my obser vation. Some of these were demonstrative of the To confirm this, I will state an experiment disadvantage of 'picking out the decayed trees,

The practice in one instance had been, in time: first was a product of more than a century-the

It would be a waste of time to multiply remarks

It may here be observed, that the information It is unfortunately too true, that eattle will crop sought for by the society, has relation to our widely different, in relation thereto, Timber, is of thinner growth, &c. But as to this, our coun-Some of the evils invariably arising to lots try itself, since its settlement, can hardly be said to have had a reproduction!!

> The next question which has been proposed is what method is best calculated, to increase the value of woodlands?

To this the answers given are general and indefinite, alluding mostly to the keeping out of cattle It is here intended to submit some reasons for consideration, as well as the result of several experiments of different modes, by which it would seem that the cutting clear and having a reproduction, is by far the most promising and effectual mode to be pursued with us,

And first, there is generally on all farms some rough or rocky soil in 'wood, 'unfit for culture, and which would be unproductive in any other appropriation.

Next, es to the certainty herein-there is no known instance of a failure in a regrowth. This has been often predicted, particularly on some loss where the tops of the trees were mostly dead; this was a score of years ago, and there is now a trees-that this is the course of vegetation, and indeed the law of nature!

However true this may appear, it may yet be answered, that after cutting off an old lot even there spring up innumerable young shoots, which seem to have been hidden, or inactive, beneath the surface, and then start into new life. The suckers, too, put forth with still more vigor, until the surface is so thickly covered that some are induced to thin the growth by a selection of hoop poles-at least to early gain if not ultimate advantage - as to which opinions vary.

nekers, it appears that the roots of old trees pensive,* w up their shoots at a greater distance, conmore and more thick. In middle age they nearer; while in younger trees they spring this Journal. the stump itself as well as about it.

in the modes of cutting. The farmer strikes largest growth, and and downward to the heart of the tree. a hollow or basin is often left sufficient to conseveral gallons of water, Fermentation is tures of the san vessels are clogged, and as it poisoned thereby.* This appearance has as well as their fruit trees from abroad? ented itself, and been so often noted by the hereto.

such is the effect of this practice, a remedy is r of the smoon.

closing, as to the inquiries of the Society, th have preceded, it should be noted, our juous farmers, it is believed, have generally of been induced first to cut clear, as well as prethe browsing of cattle on a recently cut lot, next to appropriate certain portions of their s (especially those least calculated for culture), reproduction of a growth of wood - and thus ded the safest answer, as to the best modes to lopted.

be importance of the subject in discussion, urther induced the Society, some time since, fer 'a premium of One Hundred Dollars, for est plantation of white oak, and some other raised from seed,'

was doubtless a principal object to encourage ts in bringing forward nurseries by planting corn, and sub-equent culture of the soil. This some have thought might be extended to a row tre in lots, coppiees, &c. To afford one exnent for inquirers, though on a somewhat trent principle, I took about six acres of old ure land, about seven years since, and proed gradually to plant thickly over the whole everal bushels of acorns, chesnuts, &c, in the wing manner :

tongue of earth was raised by the hoe, and corn put beneath at a depth of two to three es; then the sod was pressed down by the or hoe, to prevent a loss by birds, squirrels, all stock was kept from the inclosure. Trees, vegetated to be sure, but they seem quite unty in the tough grass-sward with which they y contend; and there appears at present, (as Lindeed apprehended) little room for much ctation from this mode.

t the present price of land and condition of country, any attempt to raise a wood-lot by opriating a valuable soil whereto with the ex-

s to the general principle of the germination peuse of culture, &c, may be found by far too ex

We are now brought in closing those remarks, ing towards the stump, and gradually become to the utility of nurseries for the rearing of forest trees, which has been most strenuously projed in

It is believed that the seed of a forest tree (parfailure in vegetation from what would seem ticularly an elin er an ash.f) placed in a nursery old age, is very rare; indeed in many cases at the time of setting out a number of trees of re the roots of large trees have not put forth, the usual size, in such cases may be afterward fficient reason has appeared, (as is apprehend-transplanted and added thereto, and present the

If these vie vs are correct, with the aid to be expected from the ardor and intelligence of the Horticultural Society, it will no longer be allowed eby had in every stage and process, and the pas a mortifying fact, that the inhabitants of Massachusetts import most of their ornamental forest

These remarks are submitted, anot so much er, that the attention of agriculturists is solici- for any knowledge the writer may posses, but that the attention of others may be turned to the subject. Thus, every step in the progress of expeby cutting a notch or gap in the rim or ex- rience, will be towards the perfection of knowledge. I am, sir, yours, JOHN WELLES.

> I have had covered very desirably with a thick growth, veral barren spots which were offensive to view, by setting out two or three pitch-pine trees (pinus rigida) which is a most unwelcome intruder on a good soil to shed their seeds thereon. Probably to have gathered the cone at early frost, and to have scattered them on the soil would have had the same effect.

> † From the extraordinary size of the tap root, or some other cause, I have had no success in transplanting the walnut or shagback,

> An elm from the forest, set out at usual size in 20 years gave 3 feet 4 inches. An ash set out as above, gave 3 feet 2 inches.

An elm seed, planted in a nursery, and transplanted to row, gave 3 feet 9 inches, An ash seed planted as above, gave 3 feet 10 inches.

HOT-BEDS

Those persons who are fond of good gardens will find it very much to their advantage to rear their young plants in a hot bed, and although professional gardeners may make theirs in March, we would not recommend those who are unacquainted with the business, to commence theirs until April.

To manage an early hot bed with perfect success, is one of the skilful operations in gardening but when the bed is not commenced until April, they may be managed with success by any one who will pay a little attention to the subject. By commencing a bed about the first of April, plants may be kent in a thrifty growing state, under the glass, until the weather becomes warm enough to plant themout, without the trouble of changing them from one bed to another, or giving the bed a second heat: whereas, if planted one month earlier, they require the skill of an experienced gardener to keep them from running up with long stalks. which would injure them, or their being stunted by the bed becoming cold, after the fermentation of the manure is over.

As we are wishing to give simple directions to those who are unacquainted with the business, the more experienced gardeners will make all allowance where we do not describe their more practi-

To commence a hot bed, take a sufficient quantity of manure, (that from the horse stables, and which has been thrown in a heap and began to heat, being preferable;) arrange it in a square form. about five feet wide, and of such length as may suit your convenience, and about from eighteen inches to 2 feet in height; on the top of this place a Code of Agriculture,

box about four feet wide, and of a length corresponding with your bed, making the north side six inches higher than the south, to give the glass sufficient slope to carry off the water.

This box should be made with good joints, otherwise the mice will get in and destroy the plants. The box thus prepared, is to be placed upon the top of the pile of mamire, which should be made level, that the box may sit close upon it. The south side of the box should be about one foot high. and the north side about one foot and a half; and when placed upon the manure, there should be put into it about four inches of good fine rich loamthat from turf land is preferred.

After the bed has been thus formed, and has become warm, (which may be known by running a stick into it), the seed may be planted upon it. The whole bed should be covered with glass, where that can be had; but as many of the farmers may not have that, oiled paper may be used as a substitute, which may be taken off in warm days. By a little attention to this mode of raising plants gardens may be advanced from two weeks to a month, and many plants raised with more certain-

ty than when planted in open ground, Among the seeds that are to be sown first upon a hot bed, may be commerated—Early York and Dwarf Cabbages, Early Cauliflowers and Brocoli. Cucumbers and Melons of different kinds, Peppers of all sorts, Tomatoes and Egg plants, Lettuce and Pepper grass, a few Radishes, Squashes, Turnip Beets, and if some eyes are cut from Early Potatoes. and planted in the bed, and after the frosts are past. planted out, they will be fit for use two weeks earlier than those planted directly in the open ground. Other potatoes may be put in holes made with a stick in the side of the bed, where they will soon sprout and he ready for early setting. If Sweet Potatoes can be procured in season, by sprouting them in a hot bed, they produce very well in this section of country .- Genesec Farmer.

VILLAGE GARDENS

Round many villages and small towns, gardens of moderate size are numerous and productive. It is a fortunate circumstance, when manufacturers and mechanics take a delight in them; since their health is promoted by the exercise in the open air for which an opportunity is thus afforded; while at the same time, any tendency to immorality is greatly checked by agreeable and useful means of occupation. The village garden is frequently the retreat of the occupier, in the summer evenings, after the labors of the day, where he agreeably employs himself, in watching over the progress of his crops, and the success of his exertions.

In those manufacturing villages, or small towns where a number of inhabitants have gardens, a taste for keeping them in good order is prevalent, and few instances of dissipation occur. In such gardens, not only aromatic herbs and medicinal plants, are cultivated, but flowers of various sorts, are raised, as carnations, pinks, auriculæ, polyanthus. &c, by the sale of which some money is obtained. The Florist Society at Paisley in Scotland, is a sufficient proof of the advantage to be derived from directing the attention of manufacturers in such innocent pursuits. The rearing of beautiful flowers is found to improve their taste for manufacturing elegant patterns of fancy muslin : while the florists of Paisley have long been remarked for the peacefulness of their dispositions and the sobriety of their manners .- Sinclair's

NEW ENGLAND PARNER.

BOSTON, WEDNESDAY EVENING, APRIL 20, 1831.

POULTRY.

Continued from page 294.

THE TURKEY, (Meleagris Galliparo, L.,) is a native of America and was introduced into Europe by the Spaniards, according to Loudon; though some authors say that the turkey derives its name from the country from which it was first imported.

Breeding .- One turkey cock is sufficient for six hens or more, and a hen will cover from 9 to 15 eggs, according to her size. The hen is apt to form her nest abroad in a hedge, or under a bush, or some other insecure place. She lays from eighteen to twentyfive eggs or upwards, and her term of incubation is thirty days. She is a steady sitter, even to starvation, and therefore requires to be regularly supplied with food and water. Buffon says that she is a most affectionate mother, but Mowbray observes that from her natural heedlessness and stupidity, she is the most careless of mothers and being a great traveller herself, will drag her brood over field, heath or hog, never easting a regard behind her to call her straggling chicks, nor stopping while she has one left to follow her. The turkey differs from the common hen in never scratching for her chicks, leaving them entirely to their own instinct and industry, neither will they fight for their brood, though vigilant in the discovery of birds of prey, when they will call their chickens together by a particular cry, and run with considerable speed. Hence when not confined within certain limits they require the attention of a keeper.

Turkey chicks should be withdrawn from the nest as soon as hatched, and kept very warm by wrapping them in flannels, or putting them under an artificial mother in a warm room or other warm cover all day long, place. Various nostrums, (says Loudon) are recommended to be given and done at this season, as a pepper corn, and a tea spoonful of milk, immersion in cold water, &c. Mowbray wisely rejected all these unnatural practices, and succeeded by giving curd and hard eggs or curd and harley meal kneaded with milk and renewed with clear This is the food for young poultry of all sorts. water rather than mdk, as he found the last often scoured them. A sort of vermicelli, or artificial worms from pulling boiled meat into strings he found beneficial for every species of gallinaceous chicken. Two great objects are, to avoid superfluous moisture, and to maintain the utmost cleanliness for which purpose as little slopfood is given hardy enough; and what they then want is room as possible. A fresh turf of short sweet grass to prowl about. It is best to breed them under a should be daily given as green food, but not snails or worms, oats, nettle seed, clover, rue or wormwood, as recommended by the elder housewives. Water is generally preferable to milk. When the weather is favorable the hen is cooped abroad in the forenoon. During the rest of the day and night, for the first six weeks, she is kept within doors. After that the hen may be cooped a whole day externally, for another formight, to harden the chickens; and afterwards they may be left to range, within certain limits, being fed at going out in the morning and returning in the evening. Their ordinary food may be that of common cocks and hens. They will prefer roosting abroad on high trees in the summer season, but that cannot, generally, be permitted without danger of their loss.

Fattening .- Loudon says ' sodden barley, or bar-

for turkeys, and the general mode of management while she is sitting; and feed her most abundar is the same as that of the common cock and hen, by when she has young ones; for then her labor They are generally fed so as to come in at Christ- very great; she is making exertions of some se mas, but they may be fattened early or late. Some- or other during the whole twenty four hours; s times, though rarely they are caponized. The has no rest; constantly doing something or oth living and dead, weight of a turkey are as 21 to 14. to provide food or safety for her young ones.

R. Weston, an English writer of reputation, in a work entitled Tracts on Practical Agriculture and Gardening has the following observations on thing and quite unnecessary. Barley meal mix fattening turkeys as well as other pontry?

Boil some rice in water gently, till it be plumped up, and very tender; add about two ounces of very brown sugar to every pound of rice just before it is boiled enough; let the fowls be fed with it three times a day; in ten or twelve days they will be fat, but if they were in good condition when put up to fatten they will be ready in seven or eight days; they must by no means have any water given them in summer; too much rice must not be boiled together, because of its soon turning sour; nor is milk so good for that season as water BEETS, six roots, the best blood, only; besides, the milk is very liable to make the Brocoll, the two best heads, rice burn to the pot,

Frequently offal rice is to be bought very cheap of the grocers in the city. The rice causes the flesh to be remarkably white, and to have a fine delicate flavor.'

Mr Cobbett in a work entitled Cottage Economy, makes the following remarks:

'The great enemy to young turkeys (for old ones are hardy enough) is the wet. The first thing is to take care that young turkeys never go out on any account, even in dry weather, till the dew is quite off the ground; and this should be adhered to till they get to the size of an old partridge and have their backs well covered with feathers. and in wet weather, they should be kept under

'As to feeding them when young, various nice things have been recommended. Hard eggs chopped fine with crumbs of bread, and a great many other things; but, that which I have seen tried, and always with success, and for all sorts of young poultry, is, milk turned into curds. Some should be made fresh every day; and if this be done, and the young turkeys kept warm, and with the owner's name (for premiums.) Such as an especially from wet, not one out of a score will intended for exhibition only, will be labelled accorddie. When they get to be strong, they may have meal and grain, but still they always love the curds.

When they get their head feathers they are common hen; because she does not ramble like a henturkey; and it is a very curious thing that the turkeys bred up by a ben of the common fowl, do qualities, size, &c, and the raiser's name. not themselves ramble much when they get old; then which a more complete proof of the great power of habit, is not perhaps to be found. And it; we seriously ask our farmers who have sheep, ought not this to be a lesson to fathers and moth- how they can approve of such a Tariff? Within ers of families? Ought not they to consider that a week an agent has been in this town offering as the habit which they give to children are to stick high as SIXTYSEVEN cents per pound for wool, not to them during their whole lives?

while she is sitting and after she has hatched : to engage, for if agents are sent out thus early to for, though she does not give milk she gives heat; purchase and will offer the prices that were offerand let it be observed that, as no man ever yet ed here, it needs no great foresight to see, that saw healthy pigs with a poor sow, so no man before the mouth of June goes out, it will be much ever saw healthy chickens with a poor hen. This bigher. It must be so. Vast quantities of sheep is a matter much too little thought of in the rearing were driven out of the country the last year, and of poultry; but it is matter of the greatest consectit cannot help raising the price of wool .- Newley and wheat meal mixed is the most approved food quence, Never let a poor hen sit; feed the hen Hampshire Post.

As to fatting torkeys, the best way is nev to let them be poor, Cramming is a nas with skim milk, given to them fresh and fresh w make them fat in a short time. Boiled carrots at Swedish turnips will help and furnish a cham of sweet food.

To be continued.

The Committee of the Massachusetts Horticultur Society for offering and awarding premiums upon the products of the Kitchen Garden, submit the fo lowing list of premiums for the ensuing season, viz. Asparagus, the two best bunches, 25 in a bunch,

Brighton Market-Monday, April 18.

[Reported for the Chronicle and Patriot.]

At Market this day 350 Beef Cattle, including 50 unsold last week, 6 pair Working Oxen, 12 Cows and Calves, 100 Sheep, and 163 Swine. 50 Beef Cattle remained unsold at the close of the market.

PRICES .- Beef Cattle-Last week's prices were not supported-a falling off of about 17 cts. per hundred on the average-more deduction on good than on thin Cattle. We quote from 4 50 to 5 17, extra Cattle were taken at 5 25 a 5 50-an unusual number of good Cattle were at market

Working Oxen-No sales noticed.

Cows and Calves-We noticed but few sales at \$17, 18 50 and \$23.

Sheep-Dull, a few only sold, price not known.

Swine-We entired one small selected lot of barrows at 5 cts, one of sows and barrows at 41c, and one of large barrows at 4½ cts. Considerable doing at retal at 5 cts. for sows and 6 for barrows.

New York, April 11 .- At market from 3 to 400 head Beef Cattle, few lots Sheep, and one of Swine.—Sales of Beef very brisk, and price a little higher than last week. A few small lots of extra taken at St, a few good at 74 a S, several fair at 63 a 7, and ordinary at \$6 per cwt. Sheep dull and very few sales effected; price well kept up, but little variation from former reports .- Swine-the lot reported above was sold for 44 a 45c per lt; Milch Cows-Market is full and sales dull, 20, 25 and \$30,-Jour. Com.

RAIL ROADS.

LIVERPOOL AND MANCHESTER RAIL ROAD Extract of a letter to the editor of the Philadelphia Gazette, dated

London, January, 1831.

The great Liverpool Tunnel, which is said to be the largest in the world, is in all respects a magnificent work. It commences a short distance from the north corner of the Queen's Dock, and runs under the town of Liverpool, finally terminating at Edge Hill, a distance of more than a mile and a quarter,-This subterranean passage is very wide and spacious, and cannot full to inspire the visiter with the most impressive admiration for an achievement that would but a few years since have been condemned as the most chimerical of all projects. The deep and heavy rumbling of carriages is distinctly heard, as they are hurried along the busy pavements overhead, teeming with life and enterprise; and as you advance, you see painted on the wall, the names of several streets, under which the line passes at various depths from the surface. The sides and roof of the vault have been white washed, and the whole is destined to be splendidly illuminated with gas, which will bestow upon it a most brilliant effect. When the day is perfectly clear, the light may be discerned at the opening of Edge Hill, when more than a mile distant. It has the same appearance as that of the upper hemisphere of the moon, seen through a thin mass of fleecy clouds. When the work reaches its completion, it will constitute one of the most splendid promenades that can well be imagined; but at present no other accommodation is enjoyed by the pedestrian, than the dim and struggling light afforded by two or three torches.

It seemed to me a matter of some surprise, how such an extraordinary excavation could be effected. I was informed by one of the Directors, that the first shaft was commenced in 1826, and the operations continued with scarce any intermissions, night or day, until the work was completed. Nearly two thirds of the Tunnel was perforated through a solid rock; so that upwards of one hundred and fifty thousand tons of free stone were removed, which served admirably for building and many other purposes. The pickaxe, hammer, wedge and gunpowder, were the principal agents employed, in thus forcing this ponderous thoroughfare through the howels of the earth. Several shafts were opened at the average distance of five hundred yards; and such was the precision with which the workmen approached each other, that they seldom varied more

than an inch at the point of junction.

Passengers destined for Manchester, repair to the grand area at Edge Hill, from which place the rail way coaches set off. I took my seat in one of those vehicles, and rapidly descended an inclined plane, leading through the small tunnel, which is about three hundred yards in length, principally cut through a solid rock, and illuminated with a double row of lamps. The carriages are variously constructed, and are quite unique in their appearance, although utility rather than elegance, seems to have been the object of the builders. The seats are divided into three compartments, some of which are tastefully lined with cloth, and each compartment is sufficiently large for the convenience of two per-The carriages and coaches are six or seven in number, and the whole joined together, present a very novel, and striking spectacle, when travelling with unprecedented velocity, and drawn only by a single engine. I found it highly necessary to purchase a ticket a long time previous to the period of starting, or I should otherwise have infallably been prevented from procuring a seat. Only one hundred and thirty passengers, comprising the stipulated number, can be accommodated at a time; and notwithstanding the carriages set out from the respective places six times every day, making the complete number of passengers seven hundred and eighty,-

GREAT SHIP BAIL ROAD ACROSS THE ISTHMUS OF SUEZ.

The railway and steam engine appear destined to produce a great revolution in the affairs of the world. What shall we say, for instance, to the astonishing feat wrought the other day on the Liverpool and Manchester Rail Road? The Majestic travelling six times between those two places, thus going over distance of 180 miles in a day-and conveying backwards and forwards 142 tons? There are ten such engines employed on the road.

But a project is now conceived of railwaying the Isthmus of Snez, and carrying over it vessels of the heaviest burden from the Mediterraneau to the Red Sea. A paper to this effect has been read before the Society of Arts in London. The vessels are to be placed upon the railway, out of the water, by means of Morton's patent slips, and then transported to the opposite sea by means of locomotive steam engines. By such slips the vessel becomes a sort of amphibions carriage, and the steam wafts her gently, crew, cargo and all, over the plains of Egypt to her native element. It is said the difficulties of the enterprise are not greater than those encountered in the construction of the Manchester and Liverpool Rail Road —and that the Pacha of Egypt has actually employed an Eugineer to inspect Morton's Patent Ship.— What are we coming to next? Shall we canal or railway the Isthmus of Panama? moving bodily the whole mass of the vessel and cargo from the Mexican Gulf to the Pacific, instead of doubling Cape Horn? If our successors go on the next fifty years, and with the same accelerated velocity as we have done for the last fifty years, what prodigies will not be performed by human ingenuity? If we extend the calculation further onwards, where will be the limit of scientific improvement?

Rail Road Mania .- We are an excitable people, albeit a very calculating one too. The hobby of the moment is rail roads, and it is ridden boldly. The stock of the Mohawk and Hudson rail road company which, at the outset, dragged heavily, and could only with difficulty be filled, is now selling at 1621, although the road is yet unfinished. Within a week, books for the stock of a new railroad, authorised in New Jersey, between Peterson and the liudson opposite this city, were opened. Three times the sum requisite was subscribed, and the scrip is now selling at 116,-even before, as we suppose, any definite survey has been made of the route, or estimate of its cost.-Yesterday the ceremonial of opening books for subscriptions to the stock of the Catskill and Canajoharie Rail Road, was gone through with at the Exchange; and it was only a ceremonial—for the thing was done in the twinkling of an eye-the subscription was declared to be filled; and though we saw many who were disappointed, we did not fall in with any who had succeeded in obtaining stock. This scrip was also immediately sold, we are informed, at a premium. All this denotes abund ant means, low profits, few opportunities of permanent investment, and,-a very little, perhaps-of the spirit of gambling .- New York American.

John Howard Smith and Elizabeth Ireland, both of Huntington, Suffolk county, L. I. were married in the year 1775. They are still living in the enjoyment of health at a ripe old age, the former being in his 87th, and the latter in her 83d year. Their descendants are as follows, viz:

17 children.

97 grand children, 135 great grand children.

I great great grand child, Total 250; of whom 210 are now living.

As a proof of the good example and the sage councils of the aged pair, in all the 210 decendants yet living, not one of them is known to be dissipated or intemperate.

The Mayor of Baltimore has caused all dogs to there are yet scores of people who are obliged, diurnally, to depart disappointed. Yours, M**. hydrophobia.

Valuable and Cheap Land-for Sale.

The subscriber offers for sale, 14,000 acres of chr Land, situated in the town of Pinckney, county of Leand state of New York. Some of the land is impro-and under cultivation. The country is remarkably he tag, being entirely free from the lever and ague and fr the common bilious fevers which often afflict the toy upon Lake Ontario, this town being 18 males east of take. The soil is principally a sandy foam, much of covered with rich black mould. The timber is chie Sugar Maple, Black Ash, Butternut, Beech, Elm. The land yields first rate crops of Grass, Rye, Oats, B ley, Potatoes and Flax; and on some lots, good Who and Corn may be grown. To those wishing to obtain perior grazing farins, a fine opportunity now offers its The produce of pasturage and hav from an acre of t land, is very large, fully equalling it not surpassing the from the same quantity of land in any other of the Bla River townships. The land is admirably well water there being but few lots which have not durable runni streams upon them. The land is well adapted to Orcha ing-the Apple tree thriving very well in this count Stock of all kinds may be disposed of with the least pos ble trouble, and to the greatest advantage, the drove purchasing at the very doors of the farmers, and payi the highest cash prices for their cattle, which will read find purchasers at all seasons of the year. Several fi mers at present residing on this town, were original from the New England States, and some of them fro Massachusetts, who are in thriving circumstances. T above described land is offered for sale at the very le price of from two dollars and a half to three dollars p acre, for the uncleared land, and from three dollars and halt to five dollars and a half for the improved lots. The Land will be sold in lots to suit purchasers, and from b to five years' credit for payment in annual instalment will be given. As a further convenience to purchase the subscriber will receive in payment, Cattle, Shee Perk, Grain or Grass Seed, for which products he wallow the highest cash prices. The title to the land indisputable, and good Warranty Deeds will be given purchasers. Persons desirous of purchasing will plea to apply to the subscriber, at Henderson Halber, cour of Jefferson, State of New York, or to DAVID CANFIEL Esq. on the town. JAMES II, HENDERSON. le to the proprietor and to his stock.

of November, eight cows produced 1272 lbs, of in fortyeight hours,'

This is equal to 159 lbs. to a cow,

In 1829, from 27th March to 28th Sept. (6 months) seven cows produced 916 lbs. I oz.

The account for the remainder of this season is mafortunately not in my possession; it was however proportionate to the preceding months.

of the field and across in rows at about a | ln 1830, from 8th April to 1st March, 1831, six cows produced 1117 lbs. 10 ozs.

This is more than 186 lbs. to each cow.

The above is additional to the supply of a famiy other cause. How far this was the result by of 5 or 6 persons, with what new milk is requir-

The cows are of native stock; several of them mp or what I suppose will answer the same raised by Mr Curtis on the farm, and have no extra esc, that of flax is no new thing in this busi- feed whatever. Their winter keeping until March When flax, was a more common article of is English hay of a medium quality-after March ion than at present in New England it was no they have the best of English hay until turned to amon thing for those who raised it to scatter pasture. Their pasturing is very good indeed; in the field a little turnip seed for early use; they have commonly one feeding of green comthis way they used to get turnips in a fine stalks in the latter part of the summer, and are ion, at a season when it is not easy to pro- turned early into the mowing grounds in the fall,

them free from injury by flies. This was The winter keeping is by no means so good as mmon practice of our respected father, the it should be; and without doubt, more butter would OHN TUTTLE, Esq. as I have heard, one of be made in the winter, and the cattle would be nily state many times. The reason of the likely to feel the beneficial effects of it through the tion which turnips received in this way prob- following season, if they had some succulent feed vas not understood, and as the habit of rais with their hay; such as carrots, ruta baga, or mangel x went into disuse, the advantage of it as a wurtzel. The summer produce of cows will depend tion to turnips was forgotten. The princi- much upon the manner in which they are kept as you well know, the offensiveness of hemp through the preceding winter. If they are stinted to the flies with which turnips are often in- and ill-used, they will not recover from the effects of such treatment by any luxuriance of feed in the am upon this subject you will permit me subsequent season. A valuable communication on this subject from one of our most intelligent e neut, that the tomato plant is of much use farmers (John Prince, Esq. of Roxbury,) may be found in the publications of the Mass. Agr. Soc, vol. vii. p. 163.

Carrots are an excellent food for cows, I know of no objection to this use of them; though they tend to increase the richness rather than the quantity of the milk. They are beneficial however in the latter respect. Ruta Baga increase the quantity of the milk, but do not improve its quality. They rather, as far as my observation goes, render it thin; though I do not find that they affect the taste of the milk, unless a portion of the tops is given with them or they are given to the animal with the sprouts on in the spring. They are very beneficial to the health of the animal. Raw potatoes increase the quantity but injure the quality of the milk. One of our most experienced and intelligent milk farmers in the vicinity of this town (J. Nichols, Esq.,) who keeps from thirty to forty cows, allows one peck of vegetables and two quarts of Indian meal to each cow per day, in addition to as much MFESSENDEN-On a former occasion I gave of the best of Euglish hay as they will eat. The e account of the Dairy of Mr Jesse Curtis in meal is of the greatest importance to the quality bread. (N. E. Farmer, vol viii. page 73.) of the milk. 'He says, he is confident that he can as for the year 1828; having now in my at any time increase the quantity of milk in the on the accounts for 1829, and 1830, I proportion of eight to five by increasing their po-

In 1828, between the 14th of March and the last can do it with potatoes and meal as above stated

Of Mangel Wurtzel as a valuable feed for milch cows I am compelled to speak with great hesitation. I know the popular opinion is altogether in their fayor; but experience is a teacher to whose authority I must defer before all others. My cows, when they have been fed freely upon them at the rate of from half a bushel to a bushel per day, have invariably been much reduced in flesh. They increase the quantity of the milk; I have been disposed to think they improve its quality; this point however is not settled with me; but they have very much injured the condition of the cows, who have been freely fed with them.

There are some authorities in this case, which certainly deserve attention. It is confidently stated that Mr Coke's cows (the most celebrated farmer in England) were very materially injured by the free use of the mangel wurtzel and some of them died. A writer in the British Farmer's Magazine, vol ii. p. 155, a strong advocate of mangel wurtzel, says 'that he has no doubt this arose from its being used in an unlimited manner immediately upon its being drawn from the ground. The roots ought not to be used before Christmas and the cattle ought to be habituated to them by degrees. I have known beast; to suffer very much from inattention to this rule.' Experiment only can determine this. My mangel wurtzel have been used both in spring and f. I, and through the winter.

Another - in the same Magazine (p. 212,) though upon the whole an advocate for this plant, says 'that mangel wurtzel are highly purgative and reduce cattle to a very thin state. As regards their feeding properties, we have observed thus much, that cattle to which they were given in moderation with a quantity of hav throve indifferently; and that the same cattle, changed from them to a moderate quantity of Swedish turnips, made twice the progress in condition,'

At the meeting of the Manchester Agricultural Society, Eng. in Nov. 1829, the Rev. Henry Berry, one of the most distinguished breeders and feeders of stock in England, and who, in this respect, ranks next to the celebrated Bakewell, remarked, 'To the comparative merit of mangel wurtzel and Swedish turnips I have paid great attention, I shall strictly confine myself to facts, which have come under my own observation; and in what I have to say I shall have to differ from many high authorities. It has been said that mangel wurtzel is more nutritive than Swedish turnips, but I am decidedly of a contrary opinion. Some years ago I was a great grower of mangel wurtzel; and I gave it very liberally to my cows; but I soon found that it reduced them to skeletons; they certainly gave a great quantity of milk whilst feeding on this root, but the milk was both thin and poor. British Farmer's Mag, vol. iii p. 480.

It will be readily granted that there are many counter authorities. With respect to my own case, they may have been given in too great quantities; or the feeding may have been begun too early in e pleasure to forward them to yon, believ- tatoes and meal. He prefers potatoes to Mangel the season; or it should have been accompanied will regard them in this branch of husban. Wurtzel as he thinks they increase the milk to a with something else besides good hay; or the xamples of excellent management, highly greater degree. He is not able to increase the flesh of the cows may have been reduced by some milk in any sudden manner by Mangel Wurtzel, but other unknown cause. I submit the facts, as I

believe them, and the authorities as cited, to the literally filled with snow by reason of the shifting ing that he had purchased and forwarded Nia judgment of those concerned. They are certainly of the wind. This snow was 24 inches or more Practical Planter, Boutcher's Treatise on Fou a valuable vegetable for many purposes and yield on a level. This snow storm was in one week Trees, and Evelyn's Complete Gardener. a most extraordinary produce: and in conjunction followed by another, nearly of equal severity, but with Indian meal may prove an unexceptionable not to so great a depth. From the commence of the U.S. in Paris, acknowledging the receipt feed. I shall be happy if my suggestions lead to ment of the first storm, Jan. 15, to the first day of various packages of letters, and Diplomas for its content of the first storm. farther and more exact experiments; and if they Feb. there was a continued frost, without the least honorary and corresponding members in Francisco are not better feed for unich cows than is feared intermission, and to add to the calamity, the Belgium and Switzerland and two vols, of the N by some, the same objections may by no means lie against the sugar beet, one of the same family, and as easily cultivated; but of this plant my cultivation and use have been quite limited. Unfortunately for many farmers, who were not Nos. 38, 39 and 40 of the Annales D'Horticultu Brewers' grains are greedily eaten by cows. They increase the quantity of milk as much as almost long continued embargo, their wood piles were any food that can be given, but injure its quality; deficient. They had wood enough in the forest, and rather tend to reduce the flesh. They certainly do not improve the condition of the animal. The cows in the London milk establishments, are plied to trees of ornament, and in some instances fed almost exclusively in some cases upon grains fruit trees did not escape, at the rate of more than a bushel per day; but they are often injured either by excessive feeding, or one or two degrees above the freezing point and a constant confinement to the stable, from which in severe snow storm with strong wind ensued. many cases they are never allowed to move; their | This snow fell about 8 or 10 inches on a level, but water being conveyed to them,

Of the articles of food that are ever given to animals, Indian meal is decidedly above all others. It is an excellent accompaniment to all succulent food. Nothing will so much improve the quality of the milk; though it sometimes tends to scour blowing about. the animal too much, and to produce fatness rather than abundant secretions of milk.

It may be deemed likewise at the present prices of corn rather an expensive feed; and cows, which fences on the sides of the roads. From the 16th have been fed excessively upon it are sometimes the weather was more mild and on the 23d at sunseriously injured; and suffer very much when after rise, the thermometer rose to 41 degrees and rain mon objects of both, in the improvement of g long use their meal is withdrawn; half a peck a day followed in great plenty, and the water in some of deningis an extravagant allowance; and two quarts is perhaps as much as may be safely persevered in ; weather continued mild to the 8th of March, from and both in respect to cows and horses it is much which time to the 30th, it was generally rough, better to give it mixed with cut hay than to give windy, and unpleasant.

It has been long my opinion that the greatest blessing of an agricultural nature which Divine Providence has bestowed upon the earth is the power of producing Indian corn. This is in truth the gold dust of the farmer, which is sure to reward his skill, toil, and industry.

In a communication involving important facts, responsible authority. This induces me to append Yours respectfully, my name.

Salem, .1pril 20, 1831. HENRY COLMAN.

FOR THE NEW ENGLAND FARMER.

THE LATE SEASON.

Mr Fessenden-Such a season as the past is not, perhaps, within the recollection of the oldest man now living in this vicinity. From the first the pressure of the water, that it broke down six of November, 1830, to the 5th of January, 1831, dams and carried away one Cotton Factory in there fell frequent and heavy rains, which filled all the streams and swamps to overflowing. Those, whose cellars are naturally wet in the spring, now found a part of their winter vegetables inundated. During this time the weather was generally mild, although the sun was hidden by clouds the greatest part of the time. For I weeks there was not according to calculation, more than IS hours of

From the 5th of Jan. to the 14th, the weather was cold, and a little snow fell in the meantime. On the 15th and 16th, we were visited by a severe N. E. snow storm, attended with a very strong wind. The roads in every direction were

wind was strong, blowing the snow into houses England Farmer, for the Horticultural Society and filling up the paths almost every day. The Paris. He has purchased Philipar's Voyage A snow at this time, was very deep in the woods, ronomique through England, and forwarded it w prepared and did not expect such a general and and perhaps within their view, but they could not go to it. The consequence was, the axe was ap-

On the first day of Feb, the thermometer rose was much thrown into heaps by the wind. On the 4th there was a small snow, say about 3 inches. -The thermometer rose to 38 degrees above zero and rain followed, although not enough to melt this last snow, but sufficient to prevent the snow from

From the 4th of Feb, to the 16th it was generally cold, attended with cold N. W. winds; at this time the paths in many places were above the our cellars was from 2 to 3 fect deep. The

The earth has been comparatively but little frozen this winter, being the greatest part of the time deeply covered with snow. Rye, after the GEN. II A. S. DEARBORN, snow went off looked bad, probably in consequence of the snow going off by the sun and some cold nights following. Its appearance is now good. The fruit of the peach as far I have examined is destroyed. The coldest day was on the 29th of it seems to me the community are cutifled to a Jan .- the thermometer stood at 6 degrees below zero. The winter past has been colder in the you, Sir, my thanks for this distinguished co aggregate than any winter since 1823,

Mansfield, April 4, 1831. ROLAND GREEN.

Note .- From the first of April to the 18th, there was little sunshine, but frequent and copious rains. The earth is filled with water and thereby the spring operations much obstructed. On the Sth and esteem. inst, there was a very beavy rain, and such was this vicinity. The wind at the same time was strong, upsetting some small buildings and demolished one barn. R. G.

HORTICULTURE,

Proceedings of the Massachusetts Horticultural Society, at a meeting held at the Hall of the Institution, en Saturday, the 23d of April, 1831.

Since the last meeting the following letters have afford some valuable additions to your colle been received.

1. A letter from Col. Thomas Aspinwall, No. 1. Alexander, splendid Russian apple, des Consul of the United States in London, announc-

2. A letter from J. C. BARNETT, Esq. Con: and No. 18 of the Annales De Fromont.

No. 3. A letter from the Earl of Roseberry, 1. President of the Caledonian Horticultural Societ

London, March 8, 1831

-I have had the honor today to recei your duplicate letter, announcing that I was ele ed in 1829 an honorary member of the Massael setts Horticultural Society. The original o with the Pamphlet containing the Charter, &c. the Institution, I formerly received, and I did 1 fail, at that time, to make my acknowledgmer for the honor conferred on me, which letter, I i sory to perceive has not reached its destination

The Presidency of the Caledonian Horticultu Society is only bestowed on the individual chos for that situation for two years. My term expir last year, and the Duke of Buccleuch became; successor; but I can venture to give assurances, the name of the Society, of their disposition any way which the Horticultural Society Massachusetts may suggest, to promote the cor I am your obedient servant,

ROSEBERRY.

H. A. S. Dearborn, Esq.

4. A letter from Jesse Buel, Esq. President the Albany Horticultural Society, with a packs of Apple scions.

President of the Mass. Hort. Society.

Sir.- A Diploma, constituting me an honor member of the Massachusetts Hort, Society, w an accompanying circular, was received yesterd through Messrs Thorburns, of New York.

I beg leave to tender to the Society, throu pliment; and to assure them, that I feel th have imposed upon me new obligations arden to cooperate in the objects of their associati -the harticultural improvement, and the hap ness of our favored country. With great respe

I remain, Sir, Your obedient servant, Albany, April 10, 1831. JESSE BULL

SIR-I have boxed, and put on board of a Be ton packet, cuttings of the following apples, I distribution among the members of the Societ Except No. 1, they are all recommended, and me of them figured in the Pomol Magazine conduct by Messrs Sabine, and Lindley of the Lond, Ho Society and garden. Except when noticed,1 original grafts came from Mr Sabine late S Report made by H. A.S. DEARBORN, President of the Society. | retary of London Hort, Society. I hope they m tion.

shall be happy to receive from the Society any s or cuttings of new or valuable plants,

Very respectfully,

Your obedient servant, JESSE BUEL.

N. DEARBORN,
Pres. Mass. Hort. Society.

ic repeated acts of liberality, and the kind attenof Mr Buel claim the gratitude of the So-That intelligent Horticulturist, and distinited patron of the various and extensive brane of rural economy, has not only done much vance the taste and interests of gardening and ing in the state of New York; but, with coma lable zeal he extends his beneficence to all parts 12 Union. His own grounds illustrate his pracskill and our public journals are often enriched s scientific communications, or lucid exposiof the interesting experiments, which he is nually making in the numerous departments orticulture and Agriculture.

Respectfully submitted by

H. A. S. DEARBORN.

Isolved, That the apple scions presented by Buel, Esq. he distributed among the memnof the Society, on Saturday next, at twelve d:k.

INSECTS IN FOWLS.

he following curious fact is mentioned by Mr eworth, in a communication on the cleanliness nimals.—(Journal Royal Institution. No. 11.) dring one day along the shore of Holy island, ie coast of Northumberland, I disturbed an slored sanderling (Calidris islandica, Steph.) flew heedlessly, and as if injured. On shoothe bird, I found that it was covered with n, more especially about the head; so much at the poor thing must have fallen a victim the point of their claws by friction and dig- the church.

Beauty of Kent kitchen, autumn, and winter, ging, which renders them unfit to penetrate their sickly than fowls from the country.'-Gen. Farmer.

ASPARAGUS.

I think an error prevails in the method ordinarily adopted in cultivating this delicious vegetable. The object is to grow a long blanched stock; which, to be sure, is inviting to the superficial buyers-but at the table is found stringy, tough, and bitter. The roots must lie deep and the growth be comparatively slow; my roots have but a superficial covering of earth. Their growth is early and rapid: and as I cut at the surface, the grass is wood is used for baking of bricks. The bricks tender, succulent and well flavored, and the whole of it eatable. I cover my beds in winter with than those made in brick kilns, where wood is manure, but rake it off and fork the ground in the suring. J B.

Albany Nursery, Dec. 1830.

Sick Peach Trees,-It was mentioned some time since by a correspondent in the papers of this city, that certain facts had lately come to his knowledge, which were stated, inducing the belief, that powdered charcoal strewed about the roots of peach trees, would be a great preservative against disease, produced by insects, worms, &c. The Boston Courier, in a recent notice of this subject, corroborates the above opinion, by his own experience; and adds that, trees planted in burnt land are universally healthy and free from worms at the root

Mr Samuel Martin, through the medium of the Philadelphia Evening Post, offers to give \$10 if 20 more are added, as a reward for the best essay on the usefulness of having at all seminaries for the education of females, as many silk-worms raised, as will be necessary to teach them the course to be pursued in maturing them. He believes that this will be the best means of diffusing knowledge on this subject.

Horseradish.—One drachm of the fresh-scraped root of this plant, infused with four ounces of water in a close vessel for eight hours, and made into a syrup with double its weight of sugar, is an improved recipe for removing hoarseness. A tea spoonful of this has often proved suddenly eftectual.

Transparent door plates of colored glass are in use in Philiadelphia, by physicians and others, which, lighted by the entry lamp, are convenient at night.

The son of a dentist, same city, died from swallowing gum elastic (India rubber) at school. The tutor had discovered that several of the pupils were chewing it, and threatened to chastise those who did so, when this lad having a piece in his mouth, swallowed to avoid detection. It swelled within him and caused death in a few hours.

Ingenious. - An ingenious plan, says an English Review, of increasing the power of the voice has been carried into execution at Attercliffe Church, Sheffield. It is effected by erecting a concave ir tormenting ravages : on further examination | sounding board, to act as a reflector behind the id that it had lost one of its legs, so that it reading desk and pulpit, with the speaker's voice om its incapability to rid itself of these in- near the focus of the concave. The effect of this that their extraordinary increase was to be reflector, it is said, increases the power of the nted. Poultry (the same naturalist remarks,) voice five times beyond the ordinary volume, so run about in stony or paved yards, wear that it can be heard in the most distant corner of will not suffer others to assist her.—Her faculties

Seed Corn.-Last year several persons in this coating of feathers; they are, therefore, more vicinity, tried the experiment of soaking seed covered with vermin, and in consequence more corn in copperas water before planning, to protect it from the attacks of the worms and crows. The experiment in all cases, we believe was successful: and we mention it to call the attention of our readers to so important a fact .- Greenfield Gaz.

1			he Courier des Etats U	,

The above table is from the Courier des Etats Unis.— The population of New Orleans is about 50,000, and that of Rochester between 10 and 12,000, but we cannot at the present moment state either with accuracy.

Mr Caleb A. Ore, boot and shoemaker of Philadelphia, has discovered a new method of manufacturing boots and shoes, for which he is about to obtain a patent. The invention consists in manufacturing these articles with but one seam, that of the boots in the heel-of the shoes over the instep.

In the family of Mrs Stilwell, Gravesend, N. Y. a colored women, who is 102 years old, has lived since she was 28. She is industrious, milks the cows, and does the washing for a family of ten persons, and are good, particularly her eye sight.

Extract of a letter from Judge Bares of New York, to C. Dear-doff, Esq. of the State of Ohio.

the wheat raised in Ohio, is of a quality inferior to that which makes the first rate flour. This is not owing to a want of proper virtue in the soil, or to any unfriendly peculiarity of climate; but is attributable to the quality of wheat sowed, and, in many instances, to a practice of permitting the crop to stand in the field till it is dead ripe, before the sickle is applied. Much of the wheat which has lately been grown in your State, and found its way to this market, has been manufactured here, and the flour sent to New York market, where, I am sorry to say, some of it, under the rigid course of inspection there pursued, has been disgraced. This is a circumstance which has not happened to the flour manufactured from the wheat grown in this country. Some millers who have manufactured and sent into market the flour of the wheat of your State indiscriminately, with the floor made from the article is seldom produced in the country the Genesee wheat, have had the mortification to have their brands condemned, and their high character partially diminished. Others who have taken the precantion to grind and send it unmixed, have only been able to obtain for it the character of second brand superfine. The inevitable result will be, that your flour must go into the market with a lower character than ours, to wit, second-rate suhabitants of Ohio, must be extremely unpleasant, as well as unprofitable. Our best farmers, to enable them to furnish wheat of the finest quality for the mills, are particularly careful in the selection of their seed. They seldom allow themselves to should be from eight to twelve weeks. sow more than two or three years in succession, the same seed which was on the same farm. weight, measure, and quality. Some take the precaution to obtain their seed from a great distance, and always find their account in it. I would suggest the idea of pursuing the same course among you. I would even take the liberty to advise you to send to this country for your seed. I have observed that seeds of many kinds are improved by transfer from a Northern to a warmer climate, and deteriorated by a contrary course. This may be said to be particularly the case with wheat. The wheat grown in the Genesce, Seneva, and Cayuga counties, has long been acknowledged to possess a deeided preeminence of character. The change under the present facilities of intercourse can easily take place, and, should it, you alone would be the gainers. The Genesce wheat, among those I acter. The kinds most sought after here, as the best, and producing the best flour, are the flint wheat, the bald red chaff wheat with a white berry, the bearded red chaff wheat with a white berry -and perhaps some others. All these kinds can ish white, and somewhat harsh sandy feel, subject to be under the most careful course of manufacturing, mixed with dark or black specks.

I have no interest in any mill or establishment no longer serve them as a menstrum. for the purchase of wheat or flour; but still feel an anxiety that your productions should be as good however useful it may be for various purposes, and as fair in market as they can be. I have no is almost indispensable to every horticulturist in idea that a change can be brought about instantly; the form of strings; and that prepared from our to pay the bounties of 8 cents per head on 40,

Some wheat has been obtained from Geauga, It is found to be a fact, that the greater part of Huron and Seneca counties which can be called cd. In from four to six weeks, in warm weather first rate. The grain from any other counties the inner layers will be completely loosened, at may be made as good. The wheat from Michigan fall apart on being lifted up; it may then be stri is superior to that from Ohio; their seed was ob- ped out, washed soft and pliable, having a smoo tained almost wholly from this State. Western and regular fibre, but as we approach the out

> Farmer, a paper recently established at Rochester, N. Y. probably it may make good wrapping paper, in and conducted with much ability and good judgment by Mr Goodsell.

HAMS.

Perhaps there is no subject of equal interest among farmers, on which there is such a contrariety of opinion, as that of curing hams. Almost every farmer who is fond of good hams, or wishes to procure a good price for them, has opinious, forms or receipts, peculiar to himself, and after all, much superior in taste or flavor to that of common salt pork .- The plan that I pursue is extremely simple and, I have no hesitation in saying, produces hams superior to any of the kind I have ever tasted, not excepting the celebrated hams of Virginia, or England, or still more famous of Calabria,

The hams, as soon as they are separated from the body of the animal, are to be closely packed accustomed food, once a day, till they are six o perfine. This circumstance, acting on a whole in a clean, tight, common sized barrel; and to a people, and that people so respectable as the in-full barrel, add a pickle, made by dissolving eight Indian meal, which is highly valuable, is added to quarts of clean Liverpool salt and four ounces saltpetre, in a sufficient quantity of rain or soft water to cover the whole. In this situation they are to remain until removed to the smoke house, which

The smoking process is to be conducted altogether with cobs or the wood of sugar maple They change often, and always gain by it, both in (the former is, preferred); and when sufficiently smoked, those that are intended for immediate use, may be hung up in dark garret, or if the weather he too cool, in the cellar; as freezing, particularly if often repeated, is very injurious. Those that are intended for summer use, are to be well white washed with lime, and when dry, wrapped in paper and packed away in new dry ashes, and then set in a cool dry place in the cellar. Particular care is requisite to prevent its being heated too much, while in the smoke house, as this is very destructive to its fine flavor.

BASS MATTING.

Q. B.

On reading an article in your paper of last week, headed Bass matting, I took some good sound basswood bark, that had been taken from have mentioned, bears perhaps, the highest char- the tree last summer, and boiled it from two to three hours in water, trying at intervals, to see whether its layers would separate; but I found at the end of the boiling that its adhesion was scarcely, if at all, diminished; which confirmed what I before supposed, that the gum, if once easily be procured. The flour produced from dried, becomes insoluble in water; this is well them is a mellow yellowish hue, and soft feathery known to be the case with gum copal, caouchouc, are but few who will at any time level their gums feel - That produced by the Ohio wheat of a blue- in ligo, and many other vegetable substances, which, by exposure to the air, undergo such chemical changes by the absorption of oxygen, and perhaps some other means, that water will guns under their control, by the lads or mea in

The inner bark of the Basswood, (Tilia Glabra) but if only a few would adopt the practice, a short trees is much better than what we get from Eu- 000 crows-\$3200.

when it will peel freely, and immerse it in wat immediately, being careful that every part is cove rough bark, we find the fibres broken and interunted by the expansion of the tree, forming The following articles are copied from the Genesee kind of irregular net work, not easily separate it appears difficult to form this part into the proj er state for matting, for when much force is r united to separate it the fibres are broken, and the ribbands will be of very irregular breadth.

Linden Hill, 3d mo. 25, 1831.

HEAVES IN HORSES.

Take one pound and a half of good ginge for a horse, give two spoonsful each day-or in the morning, and the other in the evening, min ed with wheat bran. This receipt has been sellin at the eastward for \$5, where the efficacy of th above medicine has been proved in the cure c several cases of obstinate heaves.

A spoonful of flax seed, steeped an honr o two in warm water, and given to calves with their seven weeks old, is very beneficial to them. Whe their food, a little magnesia or chalk, now and the B. Cwill prevent scouring.

BIRDS.

The robin, and other useful small birds, seen to be diminishing in numbers every year. This decrease is to be attributed in a measure to the fact that our gunners shoot them at unsensonable times of the year, before they have reared their broods of young, and even before the commence ment of the breeding season. In the spring the birds are usually poor, and worth little or nothing as food for man. Shooting them at this season prevents of course their natural increase. All the smaller varieties of birds are exceedingly useful from their being the enemies and active destroyer of the great variety of grubs, millers, slugs, car erpillars, and other worms which infest and injure our fruit trees and fields. Birds are a more effectnal preventive against the increase of insects norious to herb, fruit and flower, than any means devised by man for that purpose. They are the remedies furnished by the God of nature for that purpose. The destruction of a single small bird at this season of the year is a positive injury to the farmer or other person upon whose land it

We hold it to be an axiom, that no true sports man will demean himself by shooting small birds of any kind at this season of the year, and there at robins or any of the smaller birds. Every parent, master, and guardian, ought to lay a special prohibition and interdict upon the use of all the their employ for the purposes of sporting at this senson of the year .- Worcester . Egis.

ciety,made an eloquent address, in which, among occupies a house, either in the city or country her things, he expressed the great satisfaction he should consider himself under obligations to plant a vine to his yard. Suppose a choice variety of either foreign or native grapes should be planted cted . Ipril 13, 1831. Levi Lincoln, President; in every yard in this city, in a few years not a family, however poor, would be without this delicions fruit. The expense would not exceed from 25 to 50 cents. Many would undoubtedly be neglected and die: but many, also would grow and bear fruit abundantly. Let it be not an objection, that the tenant is to occupy but one year .- . V. I. Farmer.

> holes in the ice which cover fish ponds in winter. or the fish for want of air will suffer much and even die. The advantage of this precaution will be apparent from the avidity with which the finny of the liver. It is unnecessary to theorize on its tenant will approach half torpid, towards the new formed hole. It is said one hole will be sufficient if kept open during the prevalence of hard frosts.

New Holland Pine .- The Hispaniolans, with the highest degree of pride, challenge any of the trees of Europe or Asia, to equal the height of their cabbage trees, towering to an altitude of 270 feet: the New Holland Pine, however, is stated to attain the height of 600 feet!

Family Economy.—There is nothing which goes so far towards placing young people beyond the reach of poverty, as economy in the management of their domestic affairs. It is as much impossible to get a ship across the Atlantic with half a dozen butts started, or as many bolt holes in her hull, as to conduct the concerns of a family without economy. It matters not whether a man furnish little or much for his family, if there is a continual leakage in the kitchen or in the parlor, it runs away, he knows not how; and that demon. waste, cries more, like the horseleech's daughter, until he that provides has no more to give. It is the husband's duty to bring into the house, and it is the duty of the wife to see that nothing goes wrongfully out of it-not the least article, however unimportant in itself, for it establishes a precedent; nor under any pretence, for it opens the door for ruin to stalk in, and he seldom leaves an opportunity unimproved. A man gcts a wife to look after his affairs; to assist him in his journey tigrough life; to educate and prepare his children for a proper station in life, and not to dissipate his property. The husband's interests should be the wife's care, and her ambition should carry her no farther than his welfare and happiness of a brig and a ship from New Orleans with full together with that of her children. This should he her sole aim, and her theatre of exploits is in the bosom of her family, where she may do as

Agricultural Meeting .- The annual meeting of meal, and rye-meal, mixing it with leaven or his labor with his best friend; and if that friend e Wercester County Agricultural Society (says yeast, and adding one third of the quantity of be not true to him what has be to hope? If he e Worcester Yeoman) was holden in this town boiled petatoes. To each horse is given 12 lbs, dare not place confidence in the companion of his Thursday last. The situation of this Society is per day, in three rations of A lbs, each. The bosom, where is he to place it? A wife acts not every respect prosperous. It is believed to be bread is cut into small pieces, and mixed with a for herself only, but she is the agent of many she most noble institution of the kind in the Uni-little moistened cut straw. By this means he saves loves. And she is bound to act for their good; States. The officers were chosen with great in feeding 7 horses, 49 bushels of outs in 21 days; and not for her own gratification. Her husband's animity, and much harmony prevailed through-while the horses perform their common labor, and good is the end at which she should aim-his approbation is her reward. Self-gratification in dress, or indulgence in appetite, or more company Planting Vines in Yards.—Every person who, than his purse can entertain, are equally penicious. The first adds vanity to extravagance; the second fastens a doctor's bili to a long butcher's account; and the latter brings intemperance, the worst of all evils, in its train, - New York Mirror,

DANDELION.

The learned editors of the Journal of Health, who so sedulously attend to our bodies corporate. and tell us 'what we must eat, what we must drink and wherewithal we ought to be clothed,' have not mentioned the utility of this valuable early spring vegetable, and I therefore wish to offer it to the notice of your readers. In the medical Fish in Winter.—It is recommended to break phraseology, it has long been deemed a deobstruent, and the writer can speak experimentally of its virtue as a corrector of the bile, as a fine laxative, and of the benefit received from it in an affection mode of action. The afflicted will rest satisfied with the change in their feelings, which will be perceived after using the plant. It may be eaten as a salad with the usual dressing, or the juice may be taken, in the dose of half a wine glass full, three times a day-or the leaves may be kept in the pocket and frequently eaten in the course of the day. Dr Zimmerman, when called to Frederick of Prussia, in his last illness, recommended no medicine, but the dandelion for the dropsy under which the old tyrant labored. It is regularly brought to our market in abundance.

U. S. Gazette.

An Anatomical Sermon .- An eminent Professor of Medicine lately observed to his pupils when delivering a Clinical Lecture on the effects of Drunkenness, 'one of the best sermons for drunkards or regular tipplers would be, to exhibit to them the heart, the lungs, and the liver of an inebriate, by the same organs in a sound states, Such an exhibition, said he emphatically, would probably produce a greater effect on their minds than all the sermons which have been published on the subject .- Monthly Gazette of Practical Medi-

BOSTON, WEDNESDAY EVENING, APRIL 27, 1831.

FARMERS' WORK FOR MAY,

The proper time for planting Indian corn will soon arrive, according to the ordinary course of the seasons, and we shall, therefore, state some of the methods pursued by judicious and successful farmers for raising this very valuable product,

Judge Buel, of Albany, says ' H the soil is stiff or the sward stubborn, plough late in the fall, and harrow in the spring before you plant. If a sand or light loam, leave the grass to grow till near planting time. In either case the roller may be used to advantage. It compresses the sod, smothers the growth of grass, and prevents the escape of the gases evolved in the fermentation of the vegetable matter buried by the plough. If you have manure to spare, (and you can use it no where better than with this crop,) spread it on the the sod and plough it under. Plant your corn in hills. The distance will depend on the kind of seed and strength of the ground. I plant at three feet each way. Harrow at the first dressing, the more the better, provided you do not disturb the sod ; and plough shallow and earth slightly at the second. But exterminate all weeds. By leaving the sod unbroken, the roots of the grain have a better supply of proisture and nutriment beneath it. *

'I am satisfied from several years' experience. that other things being alike, the clover sod, ploughed under in May, will give a material increase of corn, over land which has no sod. 1 think 20 per cent on an average, and the crop is much less liable to be injured by drought. The planting should be as early as the season and soil will admit.

'Failures and great inconvenience and loss often result from the seed not vegetated, from its destruction by the wire worm and grub, and from the depredations committed upon the young plants by birds and squirrels. As I have never suffered in either of these respects I will state my method of preparing the seed. I collect in the first place a quantity of the roots of the black helebore, or itch weed, which abounds in swamps, grows with and resembles in its habits skunks' cabbage, except that the leaves are narrower, longer, and grow upon the seed stock; these I boil till I obtain a strong decoction. I then take out the roots and add to the liquor saltpetre in the proportion of four ounces to three gallons, and put in my seed corn while the liquor is yet warm. Thirtysix hours is the longest period it should be suffered to steep, as the nitre may destroy the vegetating principle of the grain. As a farther precaution, the liquor is again warmed, and a gill of tar stirred in, and the seed again immersed in it anew. Thus prepared, 1 have not lost twenty hills in four years. The germinating process commences before the corn is planted, and unless the ground is too wet to grow this crop, (and it never pays the expense of culture on soils that abound in springs, or that are naturally wet and cold,) it will continue to progress. The helebore is poisonous, and though the ground may partially extract the poison, neither birds nor squirrels will ever disturb a dozen bills, The tar impregnates the seed and protects it from the worm. The nitre and plaster, with which latter the seed is mixed before planting, combine their fertilizing properties to give vigor and strength to the young plants.

Whether it ought to be preferred to that of a sol- ority over later planted corn. The ears also fil ution of copperas, which has been pretty exten- and ripen much better in northerly climates from sively used, and with few exceptions met with this practice. entire approbation, we are not able to say

in Madison County, who is said to have raised when less cloudy, cold dripping weather prevails the greatest crop of corn ever grown in this state, and the crop is nothing like so liable to be injured ascribes his success principally to the circumstance by frost, [in autumn.] The grounds are also soon. of his having put four bushels of seed to an acre, or ready for crops sown in the fall. This mode instead of six quarts, the usual quantity; and pul- of management will often enable the cultivator to ling up all but the requisite number of the most grow the larger and more productive crops, in thrifty plants at the first dressing of the crop; and climates where they have been abandoned from that no stalk produced less than three ears. I do observing that they did not ripen when planted at not know that the facts have been correctly stated the usual time, to me; but I confess they appear to be rational. We scarcely ever notice a hill of corn, without observing a spear more vigorous than the rest. which maintains its ascendency, and is always most prolific in its return. On the contrary, those plants which are pale and sickly when young, seldom produce much under the best care. My experience warrants me in the belief, that seed taken from a stock which has produced two or three ears, is more prolific than seed which has produced but one ear?

as with all others. 'But let the farmer beware of taking his seed from too great a distance. If he should bring it, for instance a hundred miles from the southward, his corn would fail of ripening; if as far from the north, he must expect a lighter crop; and in case of drought the latter will be more apt to suffer, as it has been proved by experiment. A farmer from the County of Bristol, took seed from the County of Cumberland, Maine. It mit me to add to the list of queries in your last, came on well at first, but the summer being pretty hot and dry, it parched up, and produced next to nothing, though the seed he had taken from his own field turned out very well.

'If the farmer cannot conveniently obtain new seed; or if he be loath to part with a sort which has served him well, and choose rather to use it than seed he has not tried, let him at least shift sead from one field to another, and especially from one kind of soil to another.

· And in the cloosing of seed, some regard should be had to the state of the soil on which it is intended to grow. If it be poor, or wanting in warmth, the yellow sort with eight rows will be most suitable, as it ripens early. A better soil should have a larger kind of seed, that the crop may be greater, as it undoubtedly will.

Shell the seed gently by hand, that it may not be torn or bruised at all, rejecting about an inch at each end of the ear. And if any corns appear with black eyes, let them also be rejected, not because they will not grow at all, the contrary being branch and twig .- Imerican Farmer. true: but because the blackness indicates, either some defect in drying, or want of perfection in the grain,'-Deane.

It was the opinion of Mr Lorain that Indian corn is not generally planted sufficiently early. He observed that ' when corn is planted very early it is commonly severely affected by frost, so much that many plants are cut off by the ground. This NUTTALL, during his travels in the Missouri Teris unquestionably an injury to which no judicious ritory in the year 1810, and named after his friend farmer would expose the plant, if the advantages obtained by very early planting could be had by There can be no doubt, we believe, of the val-the frost ceases to act on the plants. Of course timore, whose public spirited exertions in the col-

uable properties of the steep above recommended, they take the lead, and will maintain their superior

The shooting and filling of them takes place Mr Buel, moreover states that 'A gentleman when the heat of the sun is much greater; and

> Lucerne,-To show the forwardness of this valuable clover, Mr Henry Cushing of Hingham informs us, that he measured plants of Lucerne on the 19th of this month, which were then 14 inches high-the land laid down with lucerne and other grasses last spring.

FOR THE NEW ENGLAND FARMER.

CHEESE-QUERY.

MR EDITOR-I was much gratified with reading A change of seed is advisable with this grain, the queries respecting the manufacture of Cheese in your paper of last week; and hope they may soon be satisfactorily answered. I intend making my own a cheese dairy the present season; but on conversing with a friend vesterday respecting it, he informed me that he had frequently heard the opinion expressed, that so good cheese could not be made npon a farm on the seaboard, as in the interior. Perwhether this assertion be correct, and if so, by what means the difficulty can be obviated?

> Yours, &c. LVITA.

A NEW, BEAUTIFUL, AND VALUABLE FRUIT, Brought from Council Bluffs, and bearing in New England. Extract of a letter from J. Winship, Esq. to J. S. Skinner, Postmaster of Baltimore. My DEAR SIR: Brighton, April 2, 1831.

We have now growing in our grounds a tree ten feet high, the produce of the seed you were so kind as to send me eight years ago, called the Shephardia or Silver Leaf Buffalo Berry Tree. The ensuing autumn we shall have a quantity of them, and some of them are very much at your service. It is one of the greatest acquisitions of the fruit-bearing kind our country can produce. For beauty of foliage, delicacy of appearance, and elegance of fruit, it is unrivalled by any new production: the fruit is about the size of the red Antwern current, much richer to the taste, and forms one continued cluster of fruit on every

SILVER LEAVED SHEPHARDIA.

Shephurdia eleagnoides.

BUFFALO BERRY TREE. RABEIT BERRY TREE.

Indian names. BEEF SULT BERRY TREE.

This beautiful tree was first noticed by Professor Mr Shephard of Liverpool, England,

The seed of the trees now cultivated at the planting later. Still if the roots remain unburt, Brighton nursery, were collected by Colonel SNELthey are of consequence established and very soon line of the city of Boston, and forwarded about repair the injury done above the soil, after ten years since to John S. Skinner, Esq. of Balction and introduction of new seeds and trees e well known and appreciated.

The tree is perfectly hardy, grows vigorously our climate; and has a near resemblance to e clive tree. Its fruit is sought after with avidy by the English and American hunters at the oper season. It is one of the earliest flowering es in North America, having alrealy shed all blossoms, and set its fruit.

Plants of a good size will be ready for safe the suing autumn at a moderate price at the Messrs inships' Brighton Nurseries,

English, French, and American Goods.

BREWER & GRANT, have taken Store No. 414, ashington Street, recently occupied by Mr Geo, Hill, d formerly by Messrs Mayo & Hill, and have opened th a handsome assortment of English, French and Amern Goods, viz. Gros de Naples, Black and Colored, do. Gros de Berlins, do. do. Marseline Florences, Rich rangeable Silks, Ture Satins, Colored Satins, Italian ustrings, &c .- Prints, Ginghams, Cambries, White and lored, Cambrie, Mull, Nausook, Swiss and Book Muss, Linen Cambrics, L. C. Holdfs., Imitation, do. do wns. 1-4 and 5-4 Lineus and Linen Damasks, 4-1 5-1 16-4 Bob't. Lace and Quillings, Lace and Cambric Capes, Veils, Fancy Silk and Gause Hdkfs, Barrage and Thi , do. Silk and Cotton, Plain and Fancy Hose, Kid oves, Horse Skin, do. Blond Gause and Barrage Veils Broad Cloths, Cassimeres, Cassinetts, Merino Cassi-res, Bleached and Brown Cottons, &c. Mourning ares of every description. hose who visit the city for the purpose of purchasing

vholesale or retail, are requested to call.

They purchase their goods principally at auction, with ch, and under such advantages as to offer those that are

ne, at low prices. one of the firm often visits New Vork for the purpose urchasing. They have also an agent at New York, o has been in an extensive retail business in this city, is well acquainted with the Boston and New York rkets, who will purchase such new and fashionable ds as may be offered on arrival of the English and nch Packets.

Iso, Catawba, Isabella, White Sweetwater, Black haburgh, and other kinds of Grapes, well packed in y-price 50 cts each. Large Tart Rhubarb Roots,
ts each. March 26. s, so as to bear transportation hundreds of miles with New Vegetables.

For sale at the Seed Store connected with the New tity of each of the following new and valuable vegeta-

Knight's new Dwarf Honey Pea; (a most delicious pea, and great bearer; originated by Mr Knight, President of the London Horticultural Society.) New Italian Head Lettnee; large, close heads, very tender; (introduced by Lieut, Ridgway, of the U.S. Navy-121 cts. per paper.) Early Orange Beet; early, beautiful and very delicate; not common in the Boston market-121 cts, per paper. Canada Crook Neck Squash; the most delicate sort cultivated in New England; in eating from the beginning of August to the first of February; small, but prolific. Com. Porter's Valparaiso Squash, have attained the size of 46 lbs, in Vermont last season. New Early Dwarf Pea, 33 cts per quart, very early and prolific-does not require sticks: also the Dwarf Blue Imperial Pea, introduced into general use by us, four years since; now too well known and appreciated to require comment. London Harticultural Pole Bean, sent to Messrs Thorburn & Sons, of New York, last year, by the London Horticultural Society-they have proved a valuable acquisition, very prolific, and rivalling the Lima Beans in richness of flavor; 50 cts, per quart. April 13.

Rye Grass Seed, &c.

For sale at the Seed store, 52, North Market street-A few bushels of Racy's Improved Perennial Rye Grass seed.

SOUTHERN CLOVER.

500 lbs fine Southern Clover, put up in Pennsylvania expressly for our retail trade. Farmers in want of good Southern Clover seed are requested to examine this.

50 bushels two towed Barley, plump and clean for seed, raised by E. H. Derby, Esq. Salem.

CAULIFLOWER AND CABBAGE PALNTS.

Cabbage, Cauliflower, and Broccoli Plants, 25 cents per dozen.

BROOM CORN.

Also, just received, a few bushels of prime Broom Corn raised last season in the vicinity of Connecticut river.

FLOWER SEEDS.

Packages of Flower Seeds, of eighteen varieties, comprising the most showy annuals, among which are the following beautiful and comparatively rare sorts; Elegant Coreopsis, Variegated Euphorbia, Cypress Vine, Candytuft, sweet scented Virgin's Bower, Sensitive Plant. &c. &c, with directions for their culture .- Price \$1 per package. April 13.

Fruit Trees, Shrubs. Grape Vines, &c.

Gentlemen in want of Fruit and Forest Trees, Ornamental Shrubs, Grape Vines, Honeysuckles, &c, &c, are respectfully informed that they can be obtained in any quantity or variety, at Nursery prices, by leaving their orders at the Agricultural Warehouse, No. 52, North Market street, Boston. The Trees will be delivered at the Warehouse, free of expense of freight, except when obtained from New York, Philadelphia, or Albany, when it will be added to the bill. Catalogues of most of the Nurseries can be obtained at the Warehouse, gratis, except Prince's of New York; of which he has lished the twentysixth edition, 91 pages, price 121 cents. As the season is forward, and it will soon be too late to transplant trees with safety, an early attention to the subject is requisite. April 13.

Fruit Trees, &c.

For sale at Davenport's Nursery in Milton, a good collection of all the most valuable kinds of Fruit Trees cultivated in New England, as Apples, Pears, Cherries, Peaches, Plums, &c.,—with a good assortment of Green House Plants and Fir Trees.—Of Pear trees, he can supply the following sorts of extra size and quality, viz :-Bloodgood's, Early Chaumontelle, Long Green Monthwater, St Michael's, Winter Bergamot, Beurre Rouge, Seckle, Bartlett, Cap Sheaf, and Buffins. Orders may be left with J. B. Rossell, at the Agricultural Warehouse, 52, North Market-street, Boston-French & Davenport, 713, Washington-street, or at the Nursery in Milton. April 13,

For Sale,

Silk Worms' Eggs, warranted good, price 50 cents per thousand, with shor practical instructions for realing Silk Worms, by J. H. Cobb, which are given to purchasers. Apply at the New England Farmer Office. April 13.

Catawba Grape Vines,

For sale by Samuel Pond, near the Universalist England Farmer, 52, North Market street, a small quan-, Meeting House, Cambridgeport, a few Catawba Grape Vines, 3 years old, price \$1,25 each

Nava Scotia Potatoes.

For sale at the Halifax Packet Office, No. 26 Foster's wharf, several barrels of prime Nova Scotia Potatoes, for seed. Farmers in want of a good variety of this important vegetable, are requested to examine these.

BRIGHTON MARKET-Monday, April 25.

[Reported for the Chronicle and Patriot.]

At Market this day 280 Beef Cattle, including 70 unsold last week, 10 pair Working Oxen, 21 Cows and Calves, 100 Sheep, and 720 Swine. About 15 Beef Cattle remain unsold.

PRICES .- Beef Cattle-The market was quicker, and we are of upinion that a little better prices were obtained on some quantities; we shall quote a small advance. Sales were from \$4 50 to 5 25, extra at 5 33 a 5 50. Working Oxen-A few pairs were sold.

Cours and Calves-Sales as follows: \$18, \$20, \$23, 24, \$28 and \$30,

Sheep-We noticed 7 Cosset weathers taken at \$6 each; 20 at \$4 84, and about 60 at \$4 67.

Swine-We noticed several small selected lots of barrows, at 5 cts. and one or two at 5 c-two hundred were taken in one lot, but we did not ascertain the price. At retail, 5c. for sows and 6c. for barrows,

MISCELLANY.

THE REFUGE.

Lines addressed by the Author to his two infant children, on placing them at an Asylum for the Deaf and Dumb.

Come to these willing gates, Ye blighted blossoms of my carly hope! Torn from your bleeding stem—unripe to die, Though spared to reverend age. No sorrow waits Within, to reach your lips her blackened cup-That cup your hapless sire still vainly seeks to fly !

Come to these peaceful walls! As yet your little hands are warm in mine ; And, while on each by turns from swollen eyes, A father's tear of gushing auguish falls More light ye seem to trace-nor can divine, Divine, mid halls so fair, why griefs mysterious rise!

Come to these silent shades! Here, shelter'd safe from men-their woes and ways, The good and kind shall guide your infant years; While gradual from your hearts the mem'ry fades Of the lone wretch who, distant, counts his days-Days rile with vain regrets, and traced in pilgrim tears! Come to your living death!

For, though your boon, yet my wrung bosom weeps Its down trod flowers; and marvels why 'twas given, Mischance should chill ye with her mildew breath, And press her marble fingers to your lips-Lips howsoe er I kiss-shall speak alone in Heaven!

Come-for more dead to me Is that fond gentle torm on whose soft breast My first love, vows your early plants were hushed, Than yours-beneath this cloistered destiny! O'er hope's pale leaves now let one ruin rest-Rest, till my death struck heart cares not to count them, crushed!

Come-for we part anon-Strangers will shield ye from that frowning glen, The world-whose wildering turns I hence pursue-And haply, one day, shape your obsequies!

But, when they tell ye how your sire hath flown Not from himself-(oh would he could!)-but you Say will your thoughtful bosoms love him ther Then, though ye may not look to meet him 'neath the skies

Come-it were best forgot What flattering visions soothed my soul's repose. When fondly dreaming what MY BOY would be; But let them pass! engorged by ravenous fate-A sigh created, and a tear can blot!

While the lone heart that yields to such decree Turns, breaking hence, as these kind portals close-Close on its joys outlived, and hopes annihilate!

Come, then-for here, at least, No vials dread, of pentence and pain, From folly's bitter streams, shall wait for you! No grave keep ambush for love's dear caress, Nor slighted bliss send spectres to your feast! May your ripe day no morning errors rue-And, though your sire himself noblest remain-Remain for aye-for you-God this last blessing bless ! MONTGARNIER.

Economy.-Without it, no one, let his income be what it may, can hope for the confidence of the public; and extravagance is certain to be accumpanied with poverty, and its votary almost invariably ends his life in want and wretchedness. By recommending economy, however, we would not be thought to recommend niggardliness, which is a vice as opposite to economy as is the most wasteful extravagance. The man who, wrapped up entirely in selfishness, refuses his aid to every thing of public benefit, who hoards his ill gotten gains in his own coffers, and whose only pleasure is to extort from the hand of poverty the last penny, is not an economical man, he is an oppressor and a niggard .-. V. H. Spectator.

HISTORY OF A DIAMOND.—There is a diamond at present, we believe forming a part of the Crown Jewels of England, which has a singular history apcap at the battle of Nancy, where his army was routed and he himself killed. This was in the year 1477. The diamond was found among the spoils of battle by a Swiss soldier, and by him sold to a French gentleman named Sancy. The family of this gentleman preserved this diamond for nearly a century, and till the period when Henry III. of France, after having lost his throne, employed a descendant of this family, who was commander of the Swiss troops in his service, to proceed to Switzerland for the purpose of recruiting his forces from that country; and having no pecumary service to command, he persuaded the same gentleman to borrow of his family the Sancy diamond, in order to deposit with the Swiss government as security for the payment of the troops. Accordingly the diamond was despatched for this purpose by a confidential domestic. who disappeared and could nowhere be heard of for a great length of time. At last, however, it was ascertained that he had been stopped by robbers and assassinated, and his body buried in a forest. And such confidence had his master in the prudence and probity of his servant, that he searched and at last discovered the place of his burial, and had the corpse disinterred, when the diamond was found in his stomach; he having swallowed it when attacked

The Bear with the Tea-kettle .- The following anecdote evinces the hardshood of bears. Fish, which forms their chief nourishment, and which they procure for themselves from the rivers, was last year excessively scarce. A great famine consequently existed among them, and, instead of retiring to their dens, they wandered about the whole winter through, even in the streets of St Peter and St Paul at Kamschatka. One of them, finding the outer gate of a house open, entered, and the gate accidently closed after him. The woman of the house I:ad just placed a large tea-machine, full of boiling water, in the court; the bear smelt it and burned his nose: provoked at the pain, he vented all his fury upon the kettle, folded his fore-paws round it, pressed it with his whole strength against his breast to crush it, and burnt himself, of course, still more and more. The horrible growl which rage and pain forced from him brought all the inhabitants of the neighborhood to the spot, and poor Bruin was soon despatched by shots from the windows. He has however, immortalized his memory, and become a proverb amongst the town's people for when any one injures himself by his own violence, they call him 'the bear with the tea-kettle.' -Kotzebue.

MAJOR ANDRE.

Mr Belsham, who is freer from mistakes respecting American matters than any other British historian, Gordon excepted, speaking of the sad fate of Major Andre, a young British officer every way unfit for a spy, says—that the high character of the American Commander, would have derived additional lustre from indulging the carnest and sole request of Major Andre to die as a soldier and not as a felon. The fact was, (I had it from several officers of rank and high character), Washington would not venture to risk the indulgence and merged his personal feelings in necessity. The British had hung three or four American officers as spies with no regard to their feelings as gentlemen. When it was whispered in camp that Andre would be shot, there was a general expression of discontent progressing to clamor. The officers said "What! shall we risk our lives, as several of us have done, and some be taken and hanged like dogs, and shall a detected British spy meet a milder fate? Alarming resignations would have been the consequence. Dr Waterhouse.

During a period of great excitement and resentment in Boston, against Sir Francis Bernard, one of the English Commissioners, asked the Governor, if he was not afraid to walk the streets and over his farm unarmed and alone, He replied not in the least. The Americans are not a bloody-minded people.'-Ib.

Valuable and Cheap Land-for Sule.

The subscriber offers for sale, 14,000 acres of choice Land, situated in the town of Pinckney, county of Lewi Jewels of Engrand, which has a singular insury appearating to it. It formerly belonged to Charles the and state of New York. Some of the land is improved Bold, the last Duke of Bergundy, who were it in his and under cultivation. The country is remarkably head can at the battle of Nancy, where his army was try, being entirely free from the fever and agree and for the common bilions fevers which often afflict the town upon Lake Ontario, this town being 18 miles east of the lake. The soil is principally a sandy loam, much of it covered with rich black mould. The timber is chiefly Sugar Maple, Black Ash, Butternut, Beech, Elm, &c. The land yields first rate crops of Grass, Rye, Oats, Barley, Potatoes and Flax; and on some lots, good Wheal and Corn may be grown. To those wishing to obtain superior grazing farms, a fine opportunity now offers itself, The produce of pasturage and hay from an acre of this land, is very large, fully equalling if not surpassing that from the same quantity of land in any other of the Black River townships. The land is admirably well watered. there being out few lots which have not durable running streams upon them. The land is well adapted to Orcharding-the Apple tree thriving very well in this county. Stock of all kinds may be disposed of with the least possible trouble, and to the greatest advantage, the drovers purchasing at the very doors of the farmers, and paying the highest cash prices for their cattle, which will readil find purchasers at all seasons of the year. Several farat present residing on this town, were originally from the New England States, and some of them from Massachusetts, who are in thriving circumstances. The above described land is offered for sale at the very low price of from two dollars and a half to three dollars per acre, for the uncleared land, and from three dollars and a halt to five dollars and a half for the improved lots. The hand will be sold in lots to suit purchasers, and from two to five years' credit for payment, in annual instalments, will be given. As a further convenience to purchasers, the subscriber will receive in payment, Cattle, Sheep, Perk, Grain or Grass Seed, for which products he will allow the highest cash prices. The title to the land it indisputable, and good Warranty Deeds will be given to purchasers. Persons desirous of purchasing will please to apply to the subscriber, at Henderson Harbor, county of Jefferson, State of New York, or to DAVID CANFIELD, Esa, on the town, JAMES II. HENDERSON. FOR THE NEW ENGLAND FARMER

BEES.

Mr. Fessenden—By your permission I will offer me observations in reference to the communican of Mr Beard, published in one of your late pers on the subject of bees. I hope Mr B. will be displeased if say that his communication sists of incongruities, from which no correct in ences can be drawn. He speaks of a hive of es which he has melted down,' (for an explanaof this the reader is referred to his former comnication). The bees in that hive were so comcly deranged from their natural course by the dent, that no sort of reliance should be placed any supposed discoveries from that source. Mr hinks that he discovered a large bee in the act aving eggs. - 1 killed some of them,' he adds, ming probably the common bees). 'These e not queens, for they all had stings,' It is ely to be believed that Mr B, is unapprised that y queen is furnished with a sting, and that queen only is found in a hive. But he again lys his unacquaintedness with the prevaling ries of the modes by which bees are propa-I. He inquires 'where are Mrs G.'s droies, vivity the young, (the eggs) at this time?' Aldhat without drones they are manufacturng family.' It is perfectly well understood that neral not a single drone is to be seen in t from September till the month of May followwhen they are produced from eggs laid by queen. To his inquiry where the drones red, he may be informed by the perusal of on the subject that drones are bred in their priate cells, from eggs deposited by the queen n the proper seasons. His last query 'whethqueen and a drone can give birth to a difspecies from themselves, or make a honeyith a sting?' if it convey any correct meaning remain without a reply. Mr B,'s remarks e to the internal arrangement of a bee hive culiar to himself, and his description of its ed with his description of his new fashioned procured at this season; but it is the re- soon perform the cure.

but if cultivators were required to supply bees are now sowing berley upon land in the best with this article in the spring, we should soon find order.—Our Gardens renew their annual promise, that our apiaries would be abandoned. We must the gooseberry blooms, and the flower buds are trust altogether to the sagacity and industry of bursting upon our plum and cherry trees. these insects to provide for themselves in their own way with as little interference as possible, The great object in the management of bees should be to provide for them a hive of proper size and so contrived that the honey may be taken with Proceedings of the Massachusetts Harticultural Solittle interruption to their economy.

Of this description is the improved hive now in use and which is generally considered as deserving of preference. It is neat, and simple, of a proper size to suit all swarms, the two drawers will contain about 24 lbs, of comb honey of the purest kind, free from young bees or bee bread and being furnished with glass fronts it may be seen when they are filled. In a favorable se ason a swarm a year old will fill the drawer twice, and the lower apartment containing about 40 lbs, will llon. H. A. S. Dearborn. be occupied by the queen and her brood, with bee bread and their winter store of honey. Experience has sufficiently proved the great utility of this improved hive, which is kept constantly for sale at the agricultural store, North Market Street, JAMES THACHER.

Plymouth, April 22, 1831.

FOR THE NEW ENGLAND FARMER.

* TWITCH GRASS, AND PLASTER FOR TREES.

Mr Editor-I am much pleased to observe your paper made the medium of information upon all things relative to rural economy. For where is things to learn, and I trust there are few of us, who would not be willing and able, to teach some useful lesson. In our business, knowledge should be considered common property and the equal right of all.

In answer to the queries of 'A Subscriber' in No. 38, I would observe, that although we have upon the banks of the Mohawk a very great abonits appear so singular that it may be passed dance of Twitch-Grass (or as we call it quickis entirely useless. Nor can we be better grass) it is not by our good farmers considered best. as 'dreadful stuff.' They are in no case afraid of eing provided with 'cciling, cracks and slides,' it, or think it 'a lion in their way,'-They meet it stent hive differs from the box hive that has and by working the land well during our hot and flavor. n use in some places for 30 years past, and if dry summers, never fail to convert the innumeraobtained a patent for it he is accountable to ble roots of this grass into a valuable manure, tentee of the hive from which he has copied. Spring and fall ploughing will not have this effect, ever seen, and of good flavor. all his improvements, however, his hive But a complete summer fallow, with good implewell adapted for the purpose in view. His ments, always renders this seeming evil a blessing ots by boxes and slides to regulate the bees in disguise. And it is the slothful gardener, alone, r labors can answer no useful purpose, but who thinks it a troublesome weed .- To the second and to disturb and interrupt their native hab- inquiry, I would notice, that the cheapest and most Why his hive should be of good size for the suitable remedy for wounds upon trees, occasioned bees, and too large for bees raised here,' re- by pruning, is, Spanish brown paint, a little thicksome explanation. Mr B. asserts that he er than painters generally use. HORTICULTURE.

ciety, at a meeting held at the Hall of the Institution on the 30th of April, 1831.

Report of H. A. S. DEARBORN, President of the Society. I am happy to state that important information

and valuable contributions of various kinds continue to flow in from all quarters. Since the last meeting the following letters have been received.

1. Letter from Henry Corse, Esq. of Montreal, with a bundle of Apple and Plum scions.

Montreal, April 16th, 1831.

Dear Sir-According to the promise I made to some of the Members of the Massachusetts Horticultural Society when, last summer, I was in Boston, I have the honor of forwarding for the Society, seions of fruit trees; most of which are of very recent origin, and from the 'original seedling trees; and it may not be, perhaps, improper to remark that, no man has a greater aversion than myself to the too prevalent practice of swelling a numerical collection by intruders that have nothing in participate to recommend them; and that, it is my belief, the varieties which I have the pleasure of sending, will be found an acquisition of no inconsiderable magnitude.

The Plums, except the November Gage, are of the Farmer or Gardener, who has not yet many my own raising from seed, the product of an annual planting since 1812, and of their merits I can speak with some confidence, possessing a considerable collection of the most esteemed varieties, and having had a good opportunity during my tour, in the proper season, of examining a very great variety from Richmond, Virginia, to Albany, and I wish them no higher distinction than to have them brought for comparison with any equal number that can be produced, or the best against the

Corse's Nota Bena, I look upon as the best.

Do. Admiral, is dark purple, about the size of these last points only that what is called boldly with their improved ploughs and harrows, the Magnum Bonum, or yellow Egg, but of good

> Do. Field Marshal, about the size of the latter and bright Red; the most showy plum that I have

Do. Rising Sun, about the size of the Bingham, bright yellow with a tinge of Red on the sunny side. The Blue November Gage is extraordinary for its late ripening and the length of time it will remain upon the tree. I have picked them in December; it is of good flavor and of medium size, they are all very productive, some of them bear too much,

Of the Apples, the most important is the Saint Lawrence, of accidental origin, bore fruit for the first time about twelve years since; is a large, beautiful and excellent fruit, ripens in September, and of his other lives, after the bees have been I have not time for further remark. The season sells here readily for from fifty to sixty cents the

Nursery-men here, in consequence of its having intelligence from only a few places in some six or to publish the remainder, which I hope will be been introduced by me. It originated in a pasture, eight states, and a small district of one of the more creditable to me in a horticultural and science accidentally, about five miles from Montreal, and Canadas; still it is evident, that it will require tific point of view, than the one now before your of all Apples, suits my palate the best of any I many years to collect even a small portion of the have ever tasted; it commences ripening in Au- existing varieties, while they are annually increasgust, and has this singular peculiarity, in maturing. As to other fruits, it has already been ascering; it is six weeks from the time the first are fit tained, that we possess many valuable native pears, for the table before the last are so; it should be plums, and peaches; but it requires the patience of tinguished for her extensive, interesting and valuaperfectly matured upon the tree and eaten im- Lectier, and the zeal, intelligence, genius, and in- ble experiments as a practical cultivator of the mediately.

on my own place, matured fruit for the first time in 1829, is large and very handsome, and of very

peculiar, and good flavor. The Reinette Auglaise and Antumn Calville, are both supposed to be of Canadian origin, and are eertainly good ones. The Nonsuch is from Eugland, ripens the latter part of August. I send this in consequence of having observed in different catalogues, an Apple resembling this same that ripens in November: this is very large handsome and good, but continues only for a short time.

I am very anxious to procure from Boston the under-mentioned varieties of fruit scions (a cutting or two of each,) particularly the native Pears, whenever a convenient opportunity shall offer: Lewis, Dix, Cushing, Wilkinson, Clap, Pound and German Muscat Pears. The Roxbury Russett and Baldwin Apple, and Downer's Cherry. Thave been so fortunate as to have obtained the Harvard, Heathcot and Bartlett Pears.

With my best wishes, for the prosperity of your Society, and for your own individual exertions in forwarding the interest of Horticulture, you will please allow me the honor of subscribing.

HENRY CORSE.

The scions which Mr Corse has so kindly presented, are an important acquisition. The varieties of fruit are remarkable in character and interesting from the country of their nativity, -more especially, since European and American cultivators have so generally turned their attention to the collection, or creation of new kinds, to replace such as have disappeared, or are deteriorated in quality. These have an additional value from having been reared in a more northern climate; as it is considered an established principle, that several kinds of fruit trees, as well as many other plants, flourish better when removed from a northern to a southern latitude, than those which are transplanted from a milder to a more northern region. Plums and Apples at least are more likely to maintain their character and even improve, when brought to the vicinity of Boston, from New Hampshire, Maine and Canada, than when introduced from New York and Pennsylvania. As Pears, Cherries and Grapes, while his neighbor Mr hardy as apple trees are generally, it is notorious, that the famous Newton Pippin, so justly esteemed in New York, does not thrive well in this state, where the climate appears to be too rigorous,

Mr Corse has conferred a great favor upon us, and it is desirable that the intercourse, which has been so generally commenced on his part, should he cordially continued, and rendered reciprocally beneficial to the horticulturists of Canada and the United States.

From the number of kinds of apples which have already been announced since the organization of the Society, and the information we are continually receiving, from all parts of the country, as to the existence of many others, it would appear that our catalogue will soon exceed that Society.

Corse's Favorite, the name given to it, by the of any other nation. As yet we have received dustry, of a Duhamel, to collect, class and describe Corse's Indian Prince is a seedling originating them. To facilitate these labors, the Society will direct all its energies; but a GARDEN OF EXPERI-MENT is indispensable for the complete accomplishment of this great object.

Such an establishment is so desirable, and important, that we confidently rely upon private and public munificence, for the means of founding dedicating to our Society, and presenting a copy for one, at no very distant period. In the mean time, great reliance is reposed upon the enterprising proprietors of nurseries, several active and zealous members of the society, and many intelligent and patriotic gentlemen, who have long directed their attention to the culture of fruit trees.

In this state, the services which have been rendered by John Lowell, Esq. of Roxbury, and S. G. Perkins, Esq. of Brookline are well known, and ducel a writer, on the theory and practical ar will constitute a valuable and interesting portion, of cultivation, until Mrs Griffith assumed that exof the horticultural history of New England. As scientific and experienced practical cultivators of fruits, and as munificent patrons of rural industry, public, emulate the independence, intelligence they have been conspicuous for the third of a century. With untiring perseverance, infinite trouble and great expense, they have collected fruits, from all parts of the world, and generously disseminated them among their fellow citizens. And instead of their ardor having abated for the culture and horticulture, by the judicious application of their magnificent grounds, it appears to increase theory to the duties of the field, and the diffusion with their ripening years, and give the energy and vivacity of youth to all their labors, and for the advancement of the husbandry and horticulture of their native state. To the late Mr PREBLE of Watertown, we are much indebted for his liberal and successful exertions, to multiply our variety of delicate fruits. He introduced the black Tartarian cherry,-the most superb and delicious of all the varieties of that fruit.

Mr PRINCE of Jamaica Plains has, for many years, been a distinguished cultivator of foreign and native fruits, and is actively engaged in making additions to his extensive collection.

Mr Manning of Salem has evinced a zeal and intelligence for this pleasing culture, which merits our unqualified admiration, and gratitude; his services are invaluable to the Society : and Mr Downer of Dorchester is constantly extending his The work when completed will consist of three researches for new native varieties of Apples, Cook, so conspicons in his attention to the manageagement of vines and in procuring the best kinds in Europe and America, and a great number of the their horticultural fellow citizens, are cooperating in the same laudable pursuit. We are therefore cheered in the hope that in a very few years, the Boston fruit market will be equal to any in the United States, and surpassed but by few in any

No. 2. Letter from Mrs Mary Griffith of New-Jersey.

Charlieshope, April 18th, 1831. GEN. DEARPORN.

SIR .- Be so obliging as to present the little volume, herewith sent, to the Mass. Horticultural they cannot fail of success.

If this first part meet encouragement, I intend Yours, very respectfully,

M. GRIFFITH.

This estimable lady, who has so long been dissoil,-for her literary and scientific contributions on various subjects, in the several branches of rural economy, and for the noble efforts she has made, to elevate the character of her sex, in all the relations of life, now claims our most respect ful homage, as the first female author on tillage The work which she has done us the honor o the library, is an anomaly in the annals of agriculture and gardening. Although the ladies are zealors disciples of Flora, and Botany has so far claimed their attention, that they can boast of several individuals, who, by their pencils and publica tions, have become illustrious for the services they have rendered to that delightful and useful science ;-still in no age or nation have they proalter station.

Well may the mothers and daughters of this reand industry of this accomplished matron of New Jersey. By precept and practical illustration, she has not only done much, to ameliorate the condition of their unfortunate country women, but rivals the efforts of our most celebrated patrons of husbandry of intelligence, on these important arts.

In the prime of life she became a widowe mother, and instead of despairing, or yielding to the too common and inefficient means of obtain ing subsistence, which either custom or false prid had imperiously prescribed, she boldly entered the the career of rural industry with the hardy cultivators of the soil; and as an agriculturist and auther, now ranks as the worthy successor of a Cos, in the land of his usefulness and his fame.

With the fullest confidence, in the beneficial consequences which will result from Mrs Griffith LETTERS ON HORTICULTURE,' it is earnestly re commended to the ladies of the United States and to every gentleman, who participates in the interest, which has been recently developed for the advancement of husbandry and gardening volumes; the second and third will soon be pub-

There are several departments of horticulture which appear more exclusively to deserve the spe cial attention of females; -such as the culture of silk-worms, bees, flowers, and the delicate varie ties of fruit. Either for amusement, instruction or profit, how can a portion of their time be more rationally employed? and in the country, all have the opportunity of indulging a taste for objects which are so directly connected with the comforts and pleasures of domestic life, and which tend, so materially, to promote the prosperity and renown of the Union. With such an enlightened instructor, generous patron, and commendable example

3. A letter from G. B. Smith, Esq., of Baltimore,

Respectfully submitted by

H. A. S. DEARBORN.

Resolved. That the thanks of the Society be esented to Henry Corse, Esq., of Montreal, or his valuable present of Apple and Plum Scions. Resolved, That the thanks of the Society be prented to Mrs Mary Griffith of Charlieshope, in e state of New Jersey, for the honor she has inferred upon the Society, by dedicating to it, intly with that of Pennsylvania, her LETTERS ON esenting a copy for the library.

CULTIVATION OF BEES IN CITIES.

We have received a small work of apwards of 00 pages 12 mo, entitled '. In Essay on the pracrability of cultivating the Honey Bee in Maritime owns and Cities, as a source of Domestic Econoy and Profit. By Jerome V. C. Smith, M. D. oston: Perkins and Marvin. New York, J. eavitt."

There is probably no object of culture, no branch rural economy which has given rise to more servation, discussion, theories and experiments an that which this treatise embraces. There ve been, perhaps, as many works published on es as there are insects in a populous hive. Still e secrets of their domicile and work shops ve not been fully disclosed, for this among other lid reasons-the operators will admit no lookson to view their manufactory. The moment we ow light on their proceedings their labors are spended. We see only what they have done, t how they performed their miracles is a mystery lack means of developing.

It happily happens, however, that we can dee advantage from the labors of these tiny artects without penetrating the mysteries of their ift. The practical part of this branch of econy is simple, and a little plain common-sense, ether with a few rules of easy comprehension, be obtained from Thacher's, Smith's and other nilar treatises, will enable any person of the st moderate capacity, a good stock of bees to gin with, one of Dr Thacher's hives and a quiet rner to place it in, to furnish himself and family th an article of food which is as wholesome as s delicious, and whose value in medicine and the s, but few people have properly appreciated. With regard to making citizens of Bees, we a only say, try and see. Experiments must cide, and we believe, so far as trial has been de, success has been the result. Dr Smith s (p. 10, of his Treatise.)

Several mistaken writers agree in remarking, it in foraging, bees rarely go more than a mile a mile and a half from home; this, my own ex-I four miles, in order to procure their full store. e island on which they are located has but few wers at any time, and on the whole, presents, the apiarian, a forbidding aspect. Notwithinding these discouraging circumstances, the antity of honey, from season to season, has been two. expectedly large, and must, therefore, have been

indering his thanks for the honor conferred upon procured from neighboring islands as well as the im, by electing him a corresponding member of main land. The nearest island, is one mile: on e Society, and expressing his disposition to ren- another, about one mile and a half-distant, honey er such services as it may be in his power to ex- bees have been observed, in great plenty, when nd, for advancing the objects of the institution. the white clover is in blossom. Indeed, a farmer informed me that he had repeatedly seen them arrive and depart for the island on which they so unexpectedly thrive. Hull, a small town, is at the distance of two miles, and Quinev about four, -from each of which places, judging from the numbers of returning bees, over the broad expanse of water heavily laden with farina and honey their burdens must have been brought,

'This relation at least shows that when obliged by necessity, bees travel to considerable distances, ORTICULTURE and NATURAL PHENOMENA, and -and also proves, that in cities, provided there were no flowers for them to visit, they would go in search of them in the environs. But all cities have gardens, and some of them are of such extent, in Boston, particularly, that, unaided by the millions of flowers, flourishing under every window, or springing up on the borders of the beautiful common, in my opinion, they would sustain, alone, a large number of hives. Again, there are an immense number of trees, in all cities, by the public walks, and in the grounds of all valuable estates, and in sufficient abundance too, to sustain, without cultivated gardens, hives enough to supply a portion of the population with a moderate quantity of honey.

' But when the trees exhaling sweet dews, the shrubbery, the flower gardens and the thousands of flower pots, yielding a rich perfume, are taken into consideration, it must be evident, that the paved city offers no objections to the successful and profitable cultivation of the honey-bee. If any demonstration is required, it need only be said that I have repeatedly exhibited a glass hive, containing over one hundred pounds, which was made in the heart of Boston, in a few summer

With regard to giving bees the privilege of tenanting the attic lofts of our mansion houses, &c. we are not prepared to offer an opinion. To say nothing of their intruding upon the prescriptive privileges of the poets' apartment, we should be apprehensive that quarrels might ensue between two classes of animals proverbially irritable. The battles of the bees and the bards though done into metre by Christopher Cockloft, Esq. would never rival that of the 'Cranes and the Pigmies,' and would produce nothing better than certain superfluous miseries of life and a plentiful lack of laurels to the luckless combatants. Setting aside evils of this kind, the plan appears to possess advantages for some situations, too obvious to need explanation or comment.

FOR THE NEW ENGLAND FARMER.

TWITCH GRASS OR COUCH GRASS, &c.

MR EDITOR-In your paper of the 6th inst. one of your correspondents wishes to be informed of rience proves to be otherwise. On an island the most effectual way to exterminate from the Boston harbor is a hive of bees, in a flourishing soil the disagreeable intruder called Twitch Grass. adition, whose range cannot be less than three 1 have, in the course of my cultivation arrived at one mode, which, though not perfectly satisfactory is yet nearly so. My object in turning up the soil is to get it into a good and full crop of grass, in reference to the market for hay." Of course, I sometimes plant but one year and seldom exceed, the intention of the corporation not to cross the

One year's culture subdivides the roots, (the by tunneling.

great source of their extension) so as to promote their increase to the greatest possible extent? A second year's planting with a good use of the

hoe checks them somewhat. But a third year 1 have found full and effectual,

This grass generally prevails most on a rich soil, about gardens near row-yards, &c ; for which reason some call it, (among the infinity of its names.) garden-grass. It fills the earth with fine roots, every minute part of which, is on separation a new plant, and is doubtless, a great annoyance to the cultivator. Besides, when made into hav, the woody fibre prevails, and it is not so mutritious, I am induced to think, as most other grasses. It becomes too of a yellow color and is very unsaleable in the hav market.

" To the description of our correspondent, obligingly handed to us, we add that of the Hon. Mr Welles from the Mass. Agricultural Repository, vol. viii. No. 1, p. 72,

'The grass called Cambridge, Dog, and Garden Grass is the Triticum repens. Dr Elliot calls it the "hurtful blue or Datch grass," In England it is called couch, knot, or dog grass. Every joint of its roots produces a new plant, and it is said to be there, as it is found to be here, one of the worst weeds and most difficult to extirpate. It resembles wheat of which it is a species. The best mode to destroy it is to keep the lands longer under the plough, with a frequent use of the hoe, as where this is not done, two years ploughing only not merely multiplies, but occasions it to engross the whole soil. It has a hard woody fibre, and is disliked by cattle. It flourishes mostly near cow-yards and gardens, and is called Cambridgegrass, from its abounding on the salt banks of Charles river. One hundred pounds cut July 22d, in late flower gave fortyeight pounds.'

SHEPHARDIA.

Messrs Winships request the editor of the New England Farmer to correct an error in his paper of Wednesday last, in regard to their being likely to have on hand the ensuing autumn plants of the SnE-PHARDIA of good size. Those gentlemen who have seen and appreciated the production, have taken all they have been able to propagate. It was with much regret they noticed its publicity, as in all probability it will not be in their power to supply the public demand. Small plants will be ready for sale in the autumn, and the price will be much reduced, with a hope to meet the public approbation.

Brighton Nurseries, May 4th, 1831.

Ebenezer T. Drake of Pittsfield, N. H. slaughtered a Pig, 11 months and three days old, weighing 3714 pounds, when carried to market, April 11, 1831.—. N. H. Patriot.

Anthracite coal is used at New-Orleans for baking bricks, and is preferred to wood, the bricks being more thoroughly baked.

We understand that the survey of a new route for the Lowell Rail Road has been commenced. It is to pass down the valley of the Medford river, and continue the line of the turnpike. It is said to be track of any road, but rather to pass under or over it

THE UNION OF LABOR AND STUDY.

We have already adverted to this subject, and now return to it again, for the purpose of laying before those who are most concerned in such a stitutions, where the manual labor plan has been is an indispensable condition to membership. associated with study. Facts always form the safest guide.

The provision requisite to a manual labor academy. -The Southern and Western Theological Seminary at Maryville, Tenn., was begun by the purchase of a farm at \$2,500. The horses, cattle, wagon, and farming utensils cost about a thousand dollars more. There is a boarding house where all the scholars upon charity are fed, and lodged.

At Danville, Ky., is a manual labor Seminary. The farm consists of 112 acres of first rate land, the necessary buildings are put up with logs, and are sufficient to accommodate 40 or 50 persons. The whole expense of the farm and the buildings was \$3000.

At Germantown, near Philadelphia, is another Academy for the union of labor and study. The farm here has 72 acres, with the ordinary farming utensils, two horses, four cows, and other domestic animals, supplying out-door employment for more than a dozen students, and shop room for 6 or 7 more. The buildings will accommodate about 40 students. The property cost \$\$000.

. It . Indover, Mass., is a department for manual labor and study. A workshop is erected here, of rough stone, 65 feet by 40; capable of containing 75 laborers. The cost was about \$3000.

The Episcopal church in Pennsylvania has lately purchased a farm of 80 acres in the state of Delaware, and near the river. They estimate the requisite amount for the purchase of the land, repairs of buildings, and stock, at \$6000. They calculate four hours each day for every student to work, and six or more for study.

each student for board, over and above his labor, which is only one day in the week, is \$25.

At Danville, where they all labor two hours daily, the expense of board is reduced to one half ability to use our senses and limbs with that readthe regular charge, when labor is not required.

At Germantows the labor in many cases is equivalent to the whole expense of board. In this place the students labor four hours every day, Sundays always excepted.

At the proposed Episcopal Institution in Delaware, it is intended that the daily labor shall about equal the expense of board; or in other words, that the stewar | or superintendent who takes the farm, shall, in general, accept the labor of each student for four hours each working day, as sufficient pay for the board of each student.

The did in each of the places named, is cenerally plain, consisting of meat and bread, vegetables, milk and fruit, but no tea and coffee.

The kinds of labor .- At Muyville, farming only is used.

. It Danville also, the labor is wholly agricultural.

.H Germaniann, are various kinds of joiner work, especially of the plainer kind: horticulture and agriculture, together with the management of horses and cattle.

Studies .- It is the concurrent testimony of all the above named institutions, that the studies of frounded with all the comforts of domestic late; in

labor. The opinion is strongly held, that their despot-but, at others, of a 'brute madman.' attainments are in every respect equal to those this circumstance, I attribute the high prices of seawho devote their whole time to study.

Condition of admission .- In most of the semdiscussion, the results of experience in those in- inaries now reviewed, the performance of labor Girt Isle; and, whose element, from the narrowness

> Remarks .- It will be seen by the preceding artieles, that no doubt can exist as to the practicability of the plan of uniting labor and study. The project, indeed, does not derive its feasibility from mere recent experience. Some of the best scholars, and most useful men in our country, have passed to lessen the tonnage of the United States? I conthrough this hardy course of mental training. Their education has been prosecuted amid the interruptions incident to laborious avocations. Their hands, hardened with severe toil, and accustomed to the rougher implements of agriculture have not been decided unfit to turn over the volumes of science, and form the figure 5 of mathematical calculation. Of how many intelligent men do we learn the simple fact, that they are self-taught? In almost every such case, there has been a union of labor and study. Labor has made the study sweet, and study has, in its turn, soften-

The above article is from our respected contemporary 'the Columbian Star,'-If additional facts and arguments are required to enforce the propriety, and indeed absolute necessity of labor, call it by what term you choose, gymnastic, agricultural or mechanical, and perhaps each in turn ought to be had recourse to by students, it would be sufficient to refer to the experience of Pestalozzi, and above all of Fellenberg in his celebrated upper Alabama and Mississippi, with all Tennessee, establishment at Hofwyl,-Ample and very satisfactory details on this engrossing subject will be found on reference to the American Journal of Education. We are satisfied, by intimate experience, and we may say personal suffering, that sad injustice is done to human nature in the common systems of education, by a neglect of suitable and Expenses.—At Maryville the annual expense of regular physical exercise; directed as well to the a Rail Road from New Orleans to unite with that immediate preservation of health and prevention of of the valley, will more than compensate the case numerous ailments, as to the learning of some useful handicraft employment, and acquiring the iness and accuracy so useful in the various situations of life, whether of daily business or unforeseen peril and emergencies, Journal of Health,

> RAILROADS IN THE UNITED STATES, EUROPE AND $A \leq LA$.

Then eventual effects on Tonnage and for Commerce, and the particular effect of them and other circumstances, on that of particular enect of the United States

The circumstances of the high price of sailors' wages, the diminished quantity of tonnage in the Southern ports, and the generally, if not decreasing, stationary state of the United States Commerce. induce me to address you. I would premise my people of the United States, generally, have labored under a great mistake in believing, that its foreign commerce would go on increasing, until it obtained a condition sufficiently magnified to contend with, or rather rival, that of G. Britian. The latter country is a small, and greatly consuming territory. The former, extensive-and as to its Western sections, consumes but little. The latter has none of the immense resources within herself, which the former possesses in such abundance. The cultivation of these resources, and the land, offer greater inducements to the industrious and independent man, than the naval profession can possibly do. In the one, his actions are 'free as air,' and he is surthe students are no wise impeded by their manual the other, he is the slave of, at times, an intelligent of the work.

The Western States afford him men's wages. a greater inducement than the navigation of the Atlantic, which he leaves to the natives of the Sea of their native land, is essentially the ocean. Their march is indeed over the mountain wave, and their home is on the wild of waters. I have reflected much on the subject, and think that those who follow my example, will eventually arrive at the same conclusion.

But, is there no other cause which will contribute tend that there is, and that it will be found in the universal adoption of railways. The profound ignorance prevalent as to their value, will be well recollected. To remedy this, and to hasten their progress, it should seem they are now being laid down in so many places, in links, as to develope their advantages in the most striking manner. The people of Philadelphia have determined, with a view to their more successful rivalry with New York, to aid their Jersey neighbors, in laying one down to Amboy Nor have the citizens of Baltimore been behind hand. With their eyes directed Westward and Southward, they have excited the inhabitants of Ohio, and the Shenandoah valley, to unite with them in making Baltimore the great Port for the transmission of Western produce to Europe; and this they are doing, while the Richmond Enquirer is writing its 1,001st essay on State Rights, and persuading the Senate of Virginia to rum its Eastern section, by denying the Petersburg Rail Road Company the \$160,000, which, if common sense or candor, arudence or common foresight could be found in Virginia, should have been granted without de-bate. The result will be, that the commerce of will be at Baltimore before the talking States can stir a step.

Taus begun, the Rail Road system will annihilate the coasting trade—for if the people of Charleston can bring a bale of Cotton for 54 cents from Augusta, it will not cost 25 to bring it to Baltimore from Huntsville; and there is little difficulty in foreseeing that, eventually the facilities offered by of marine conveyance, accompanied, as it is, by the difficulties offered by the point of Florida, and the shallow harbors of the Southern States.

Indeed, however important may have been the discoveries of the mariner's compass, or of the passage around the Cape of Good Hope, they will be equalled by the value of the Railway. It is not going too far to anticipate a passage from the North of Germany to the Gulf of Ormus-The distance, on an air line, is not, to speak very largely, (so as to leave room for blumders) 10,000 miles. And \$10,000 per mile would effect it. This would be \$100,000. 000, or £25,000,000 sterling—and this expense would be divided among France, Great Britian, the German powers, Russia, Turkey, Persia, and the East India Company, under a new and efficient organization. The mineral wealth of the dependencies of Austria and Russia, are immense; and, in the wishes of the Porte to ameliorate the condition of the people, will be found powerful auxiliaries in the scheme. It would indeed 'annihilate both space and time'-and, in the interchange of commerce, add much to the happiness of the world.

Tunneling the Allegany .- A petition has been presented in the Legislature of Pennsylvania, from Gen. Simon Cameron and others, for an act of incorporation to make a rail road across the Allegany mountain, on the plan recommended by Moneure Robinson, with a tunnel. The company offer to give security for the certain and speedy completion

BOSTON, WEDNESDAY EVENING, MAY 4, 1831.

PARSLEY. (Apium petroselinum.)

This well known garden-plant, is, in England, a subject of field cultivation. It is a native of Sicily, but will endure the winter of our climate, Mr Loudon says, 'Parsley is sown along with clover and grass seeds in some places, and especially in Lincolnshire, as a preventive of the rot in sheep. A writer for the Farmer's Magazine, (Scotland.) says, 'a friend of mine having occasion to observe the partiality of black cattle for the common garden parsley, and their preference of it, when growing, to almost any other green food, took it in his head to try how it would succeed in a field that he was going to sow down for pasture. He accordingly sowed two or three ridges with parsley seeds, and the rest of the field with clover and rye grass. As soon as the field was ready for pasture he led his cattle into it, and it was perfectly evident that they preferred the part which was sown with the parsley, to any other part of the field, insomuch that they never touched the rest, while there was a single blade of parsley to be had. Horses were equally fond of it. He had not an opportunity to try sheep upon it; but the probability is, that they would (if possible) have been fonder of it, and thriven better than the other two. We know that black cattle, sheep, horses, and indeed every other animal, always prefer that food, when they have it in their power to make a choice, that it is most agreeable to them and most conducive to their health. We know, also, that parsley is a most wholesome vegetable for the human species. It is a powerful antiseptic. If we were to reason from analogy we should suppose that its beneficial properties should extend to the animal creation in general.' Willich's Domestie Encyclopedia, says Parsley is propagated by seed, which according to Miller several weeks under ground) in the proportion of two bushels per acre, in rows about one foot ever tried. asunder, and hand hoed; though Mr Mills [in his Practical Husbandry, vol. iii.] is of opinion, that the plants will flourish better, grow to a larger size, and be in all respects, more perfect, if the distance between the rows be sufficient to admit a will afford a better food for cattle.

ject to that disease. Mr Mills, therefore, recom- of the seed; this is a mistaken notion, as, in a few It may likewise be beneficially given to sheep af- and becomes a dryish wisp, unfit, at least for the fected with the scab or red-water, and is said to be present, to afford either heat or nourishment to very efficacious in recovering surfeited horses, or the plants. such as are subject to the grease,'

be sown among oats and fed the following year grains of good melon-seeds, distant two inches with sheep. Two bushels of seeds to the acre is from one another, and cover them about half an the quantity recommended when no other grass inch deep. The plants in these hills should be so gully party, says 'I see you have made a seed is sown; but, probably, the management thinned as eventually to leave but two or three in a but that dirty trick that I did, but all the plan- would be to sow it with clover or some other suc- hill, culent grass,

Loudon says that parsley is sown along with clover and grass seeds in some places, and especially in Lincolnshire, as a preventive of the rot in sheep, &c. In laying down lands to grass, Hoyte in the fourth volume of Communications to the Board of Agriculture, advises the sowing with twelve pounds of white clover, two pounds of red clover, two pecks of ryc grass, and two pounds parsley to the acre; as the parsley stands two years, and by its diviretic qualities, prevents the sheep from dying of the red-water, which too luxuriant clover is apt to produce. The seed requires a longer time to germinate than any other agricultural plant, and might probably be advantageously prepared by steeping.

GARDENER'S WORK FOR MAY.

It is nearly or quite time to attend to raising your principal summer crop of cucumbers. And first with regard to seed. Euglish gardeners say it is advisable to use seed from two at least to four years old, in preference to newer seed, as the new seed is apt to run too much to vine, and the plants from it do not show fruit so soon, nor so abundantly as those from seed of a greater age. But when seed has been kept more than four years it is sometimes found to be too much weakened. Mr Armstrong in his Treatise on Gardening says, it is best to sow old seeds in the spring, when vegetation is most powerful, and new ones in July, when it begins to abute. The same auther gives the following directions for obtaining a summer crop of eucumbers.

'The ground being dug and smoothed, line it into squares of six feet. In the centre of each, dig a hole about fourteen inches deep; fill this with well rotted dung, and sow on it five or six cucumber seeds : cover these with mould, and, when they rise and take a rough leaf select two to each hill, and draw out the remainder. This sowing cannot in our climate be safely made till the 10th of May. Dr Deane says the dung of swine should should be drilled (early in the spring as it remains be put under cucumbers, which makes them grow more rapidly than any other manure which I have

Melons .- 'The following are M. Mahon's directions for planting melons in the open ground. Some time in May 'prepare a place of rich sandy ground, well exposed to the sun; manure it and give it a good digging; then mark it out into hoe-plough. He adds, that a smaller quantity of squares of 6 feet every way; at the angle of every seeds will be required, the culture will thus be square dig a hole twelve inches deep, and eighless expensive and, he is confident, the plant teen over, into which put seven or eight inches deep of old hot bed dung, or very rotten manure; throw 'This vegetable is eaten with great avidity by thereon about four inches of earth, and mix the sheep, and it not only renders their flesh more dung and earth well with the spade; after which delicious, but is also believed to preserve them draw the remainder of the earth over the mixture against the rot. Instances have occurred, where so as to form a round hill about a foot broad at the sheep fed on parsley remained sound, while those top. Some people use hot stable dung under an in the vicinity of the farm were uniformly sub- idea that its heat would promote the vegetation mends these animals to be fed with it, twice in hours it loses all it had, for want of a sufficient the week for two or three hours at each time. - quantity being together to promote fermentation,

When your hills are all prepared, as above, Another English writer says that parsley should plant in each towards the centre, eight or nine

Squashes .- These may be cultivated in the same

They should be sown at the same time, and at water to be closed by doors at will. Should the plenty of food and water or restricted to a pone similar distances, with this difference, that fewer water be of considerable extent a small boat would, with access to as much solid food as they will en seeds will answer, as they may be thinned, till be necessary, and might be also conducive to the which last method is preferable. They fatte eventually but two plants are left in a hill.

Pumpkins will grow on any seil which is prop-Indian corn. The hills in such cases should stand about seven feet apart each way, and a number of lowance for what may be destroyed by insects.

Peas are an important article in a kitchen garden. For the early crop choose a dry warm soil, well sheltered from the northerly winds. After the ground has been well dug, raked and levelled, mark it out in double rows, about 10 inches apart and leave intervals of three-feet for the early small kinds; four feet for the larger, and five feet for the largest, so that when they are furnished with brush or poles of length proportioned to their growths respectively, there may be a free pasage through the intervals. Make the drills three inches deep; and place the peas about an inch apart in the drills, and cover them with a rake. It is recommended when the first plants are up to put in another erop for succession. In this way green peas may be had from early in June till sharp frosts put an end to vegetation.

Bush beans .- It is very desirable to have beans early, and they should therefore be planted as soon as the ground is warm. It is usually proper to plant a principal crop in the beginning of May, and successional crops, about the middle and towards the end of the same roomh. For the early choose a piece of light ground well manured. Make the drills about two feet and a half apart, and an inch and an half deep. Place the beans in the drill, 23 or 3 inches from each other and draw the earth evenly over them.

Pole Beans,-In raising beaus whose vines need support the following mode is prescribed by the Farmer's Guide. Let poles of a proper height be fitted in the ground about 2 feet apart, in rows 3 or 4 feet distant from each other-around each pole let 4 or 5 beans be planted; the poles should have small knots left on them, or pins put through to support the vines. This way of planting gives an opportunity of keeping the soil loose around the roots, and prevents the injuries arising from driving poles into the hills. Of the various sorts of pole beans, one planting is enough; for if you gather as the beaus become fit for use, they continne bearing all though the summer, especially the Lima bean, which delights in heat, and which should not be planted till the ground is quite warm. The scarlet bean (multiflorus) is well worth cul- much abroad, tivating, both for use and ornament.

POULTRY.

Continued from page 31%.

The order anseres comprehends the duck, goose, swan and buzzard under a regular system. Mowbray observes, it would be preferable to separate entirely the aquatic from the other poultry, the former to have their houses arranged along the banks of a piece of water, with a fence and suffi- turing upon the water.

way as is directed for encumbers and melons, ciently capacious walks in front; access to the pleasure of angling.

THE DUCK, (Lass baschus.) The flesh of the such a variety abroad as is natural to them, more or for hoed crops, but the land cannot be made too duck is savory and stimulant, and is said to afford particularly if already in good case; and there rich for them. London says, though the pumpkin nourishment preferable to that of the goose, being no check or impediment to them from pining is commonly cultivated in gardens in England, for less gross, and more easily digested. The flesh but every mouthful tells, and weighs its due weigh enriosity, yet in some of the country villages the of the wild duck, though more savory than that A dish of mixed food is preferable to clear grain inhabitants grow it on dunghills at the backs of the tame, is supposed to be still more easy of and may remain, on the bank, or rather in a she of their houses, and train the vines to a great digestion. The ancients went even beyond our for the ducks. Barley, in any form, should never length over grass. The Farmer's Assistant thinks, greatest modern epicures in their high esteem for be used to fatten ducks or geese, since it render that pumpkins will grow better when planted by the flesh of the duck, and Plutarch asserts that Cato their flesh loose, wooly and insipid, and deprives themselves than when raised, as usual, with preserved his whole household in health by diet- of that high savory flavor of brown meat, white ing them on duck's flesh,

Breeding .- One drake is generally put to five it clickeny, not unlike in flavor the flesh of ord seeds should be planted in each hill, to make al-|ducks; the duck will cover from cleven to fifteen nary and yellow legged fowls. Oats, whole a eggs, and her term of incubation is thirty days, bruised, are the standard fattening material & They begin to lay in February, or March, and are ducks and geese, to which may be added per apt, like the Turkey, to lay abroad, and conceal meal as it may be required. The house washi their eggs by covering them with leaves or straws. profitable to mix up their food under confinement The duck generally lavs by night or early in the but it is obvious that while they have the benefit morning; white and light colored ducks produce of what the pon laffords, they can be in no wante similar eggs, and the brown and dark colored loose food. Acorns in season, are much affects ducks, those of a greenish blue color, and of the by ducks which have a range; and they will this largest size. In setting ducks it is considered so much on that provision, that the quantity of fa safest to put light colored eggs under light ducks, will be inconvenient, both in cooking and upon and the contrary, as there are instances of the the table. Ducks so fed are certainly inferior if duck's turning out with her bill those eggs which delicacy, but the flesh cats high, and is far for were not of her natural color.

> and safe place, rather than any attendance, and crable inferiority. Offal-fed ducks' flesh does to will, at nature's call cover her eggs, and seek her emit the abominable stench which issues from of food, and the refreshment of the waters. On ful-fed pork. When live ducks are plucked, on hatching there is not often any necessity for taking a small quantity of down and feathers should be away any of the brood, barring accidents; and taken from each wing, having hatched, let the duck retain her young upon 'Ducks,' says Nicol, a Scotch writer on Hotel the nest her own time. On her moving with her culture, 'are excellent vermin-pickers, whether broad, prepare a coop upon the short grass, if the caterpillars (such as are within their reach weather be fine, or under shelter if otherwise: a slugs, snails, and others, and ought to be turns wide and flat dish of water, often to be renewed, into the garden one or two days every week standing at hand, barley or any meal the first food. throughout the season. Never keep them longe In rainy weather, particularly, it is useful to clip in than two or three days at a time or else they the the tails of the ducklings and the surrounding down of their food, and become indolent. While her beneath, since they are else apt to draggle and they should be offered no food, but may have a little weaken themselves. Each duck should be cooped water set down to them if there be no pond of at a distance from any other. The period of her stream in the garden. confinement to the coop depends on the weather and the strength of the ducklings. A fortnight gooseherries; and, while they can get at these will seems the longest time necessary, and they may be not seek after little snails or other insects; but the sometimes permitted to enjoy the pond at the end are most useful before these come into season for of a week, but not for too long a time at once, them. There are some kinds of vegetables the least of all in cold, wet weather, which will affect have a liking to, and on which they will a and cause them to appear rough and draggled. In if vermin be anywise scarce; therefore when such case they must be kept within awhile, and this is perceived they should be turned out. Never have an allowance of bean or pea meal mixed with turn them into the garden in the time of heavy their ordinary food. The straw beneath the duck rains, or in continued wet weather; as in that should be often renewed, that the brood may have case, and particularly if the soil be stiff, they per a dry and comfortable bed; and the mother herself be well fed with solid grain, without an ample allowance of which, ducks are not to be reared or kept in perfection, although they gather so

Ducks' eggs are often hatched by hens, when ducks are more in request than chickens; also as ducks in unfavorable situations, are the more easy to rear, being more hardy; and the plan has no objection even in a confined place, and with a small stock without the advantage of a pond; but the hen is much distressed as is sufficiently visible, and in fact, injured, by the anxiety she suffers in witnessing the supposed perils of her children ven-

Ducks are fattened, either in confinement, wit speedily, in this mode, mixing their hard meat wh is its valuable distinction; in a word renderir disagreeable. Fed on butcher's offal the flesh to During incubation the duck requires a secret sembles wild fowl in flavor, with however consideration

'They are very fond of ripe strawherries ter and harden the surface, to the injury of small erops and rising seeds,'

The Old Sherman Morgan Horse,

This Horse so well known in Vermont and New Hampshire, will stand the coming season, at the 'TEN HILLS STOCK FARM in Charlestown, Mass. 23 miles from the city of Boston, viz. at one dollar the in ite to be paid to the group at the time of covering, and a conditional Note, to be received, for fifteen dollars, to be paid, if the mare is in foul; all mares parted with, before the usual time of foaling, will be considered in toal, and the note to be valid .- These are the only terms on which this Horse will be allowed to cover. The Stock of this Horse is so universally known and

admired throughout New England, that it is hardly necessary to repeat their merits. To a seller of Horses, it of the Morgan Stock, and he meets with a ready sale, at good prices, and the purchasers are more than satisfied. They excel in great endurance, carrying weight a long distance, noble and generous spirited, with a docility of temper, that the most timid can drive them, but it not to their mettle, they are a full hand for the best whip .-It has been asserted (and I believe it cannot be contradicted with propriety) that there has never been a Stock of horses in New England, which have proved to be so generally useful, as the Morgan stock. They have often excited the admiration of strangers. The above remarks are particularly made for those at a distance, who have not an opportunity of viewing for themselves; for those who have, the Sherman Morgan needs no praising —Pedigree, &c. hereafter. SAM'L JAQUES. i.ig.—Pedigree, &c. hereafter, May 1st, 1831.

The Naturalist,

DEVOTED to Geology, Botany and Mineralogy, edited by D. Jay Browne, and published monthly by Peirce & Parker, 9 Cornhill, Boston. Each No contains 32 Svo. pages, accompanied with a plate. Price \$2 a year. The first five numbers of this work have been issued, the contents of which are as follows: Zoology. Man. Beaver, The Bee, The Silkworm, White Ants, Botany, The Vine, The Mulberry, The Lilac, The Weeping Willow, The Sugar Maple, Mineralogy, Platina, Gold, Silver, Mercury, The Culture of Silk, Remarks on the Culture of The Vine, and The Cultivation May 2, 1831.

Rye Grass Seed, &c.

For sale at the Seed store, 52, North Market street— A few bushels of Racy's Improved Perennial Rye Grass seed.

SOUTHERN CLOVER.

500 lbs fine Southern Clover, put up in Pennsylvania expressly for our retail trade. Farmers in want of good Southern Clover seed are requested to examine this.

BARLEY.

50 bushels two towed Barley, plump and clean for seed, raised by L. H. Derby, Esq. Salem.

CAULIFLOWER AND CARRAGE PLANTS. Cabbage, Cauliflower, and Broccoli Plants, 25 cents per dozen.

BROOM CORN.

Also, just received, a few bushels of prime Broom Corn raised last season in the vicinity of Connecticut river-

FLOWER SEEDS.

Packages of Flower Seeds, of eighteen varieties, comprising the most showy annuals, among which are the following beautiful and comparatively rare sorts; Elegant Coreopsis, Variegated Euphorbia, Cypress Vine. Candytuft, sweet scented Virgin's Bower, Sensitive Plant, &c, &c, with directions for their culture. - Price \$1 per package.

Nova Scotia Potatoes.

For sale at the Halifax Packet Office, No 26 Foster's whart, several barrels of prime Nova Scotia Potatoes, for Farmers in want of a good variety of this important vegetable, are requested to examine these. April 13.

Latest Improved Short Horns.

YOUNG WYE COMET.

stock, that this fine full blood animal will be under his care this season. Terms §2. Apply to A. GREEN-WOOD, near Dr Codman's Meeting-house. April 20.

For Sale or Exchange,

A valuable mare, with foal by one of the best studs for draught horses in the country; she will be exchanged at a bargain for a first rate family horse. Apply to J. B. RUSSELL. 3tis April 20.

Sweet Potato Slips, &c.

This day received at the Agricultural Warchouse, 52 North Market-street, a further supply of Sweet Potato Slips-Price 17 cents per quart; 50 cents a half-peck .-Also, a fresh supply of Millet and Orchard Grass seed.

For Sale.

Silk Worms' Eggs, warranted good, price 50 cents per thousand, with short practical instructions for rearing silk Worms, by J. H. Conn, which are given to pur-chasers. Apply at the New England Farmer Office. April 13.

Agricultural Seeds.

For sale at the New England Seed Store, 52, North Market street, Boston,

Buck Wheat; Perkins' Early Seedling Potatoes, (that took the premium from the Massachusetts !forticultural Society); Burnham's Premium Potatoes, (that have twice taken the premium from the Essex Agricultural Society, as the best stock potatoes raised in the county); Early Manly Potatoes, (originally from Europe); Grass Seeds of all kinds, &c .- all of the very first quality. ASPARAGUS ROOTS.

Several thousand plants of the Large Early Devonshire Asparagus, 3 years old, price 75 cts per hundred, well packed in moss, in boxes of one, two, and three hundred root- cach

Also, Catawba, Isabella, White Sweetwater, Black Hamburgh, and other kinds of Grapes, well packed in moss, so as to bear transportation hundreds of miles with sifety-price 50 cts each. Large Tart Rhubarb Roots, 25 ets each.

Yellow Locust Seed.

Just received and for sale at the Seed Store connected with the New England Farmer Office No. 52 North Market Street,

A few Bis. genuine Vellow Locust Seed, (Robinia pseudoacacia) saved near Harrisburg, Pa. expressly for this L-tablishment. The excellence of this tree for ship timber and fences, its rapid growth, and its beneficial eftects on sandy, barren plains, where it thrives well, are too well known to require comment.

Cow Cabbage.

Just received, at the Seed Store, No. 52 North Market street, from London a small quantity of Seed of the Cow Cabbage; it is thought that no plant cultivated in this country will give so much fodder from the same space of ground, for Milch Cows, as this. It has been successfully cultivated to a large extent in New England and the Middle States the past year, and promises to be a great acquisition.

Dr Hull's Patent Truss.

DR HULL, Sir-Under the advice and direction of DR KNAPP, I have been cured within the year past of a bad rupture of 9 years' standing, by the use of one of your patent trusses. I had worn various kinds of trusses before I got one of yours, but they were very burdensome to me. Your truss, on the contrary, is comfortable to wear, and as convenient to put off and on as a pair of spectacles. I were it not to exceed five months, and found myself cured. I have not had it on for six months past, and have exerted myself violently at wrestling, jumping, riding, and other hard exercises without any return of the complaint, not even a fecting of weakness in the part. In fine, your truss has made me as sound and well as ever I was; it is one of the most valuable inventions in the world.

H. N. FISHBURN.

BALTIMORE, Jan. 1831. Dr Hull's Trusses are sold by Eben. Wight, (sole agent for this city,) Milk-st. opposite Federal-st. eop3t

BRIGHTON MARKET-Monday, May 2.

[Reported for the Chronicle and Patriot.]

At Market this day 160 Beef Cattle, S pair Working Oxen, 14 Cows and Calves, and 380 Swine.

PRICES .- Beef Cattle-In consequence of the limited The subscriber informs those disposed to improve their number at market an advance of about 50c. per cwt. was effected; we quote from \$5 to 5 75, extra at \$6.

Horking Oxen-No sales.

Cows and Calves-A few sales were effected-no price noticed-all at market were ordinary.

Sheep-None at market.

Swine-We noticed one or two lots of barrows, at 5 cts. At retail, 5c. for sows and 6c. for barrows,

MISCELLANY.

ARTIFICE.

What 's the bent brow, or neck in thought reclined? The body's wisdom to conceal the mind. A man of sense can artifice disdain, As men of wealth may venture to go plain; And never be this truth forgot, Solemnity's a cover for a sot. I find the fool when I behold the screen, For 'tis the wise man's interest to be seen.

EXTRACTS FROM BERTHA'S VISIT TO HER UNCLE.

My uncle told me today of a curious mode of catching fish by diving, which is practised in the Gulf of Patrasso, in Greece, and which is, he be-

lieves, peculiar to that place.

The diver being provided with a rope, made of a species of long grass, moves his boat where he perceives there is a rocky bottom; this done, he throws the rope out so as to form a tolerably large circle: and such is the timid nature of the fish, that instead of rushing away, they never attempt to pass this imaginary barrier, which acts as a sort of talisman; they only descend to the bottom, and endeavor to conceal themselves among the rocks. After waiting a few moments, till the charm has taken effect, the diver plunges in, and generally returns with several fine fish. As he seldom finds more than their heads concealed, there is the less difficulty in taking his prizes; and these divers are so dexterons, that they have a method of securing four or five fish under each arm, beside what they carry in their The effect of the circle reminded Frederic of the singular manner in which pelicans and cormorants catch fish in concert with each other. They spread into a circle at some distance from land; the pelicans flapping on the surface of the water with their great wings, and the cormorants diving beneath, till the fish contained within the circle are driven before them toward the land. As the circle becomes contracted, by the birds drawing closer together, the fish are at length brought within a nar row compass, where their pursuers find no difficulty in taking them. One species of cormorants are so docile that they are trained by the Chinese to fish for their masters. They plunge into the water at a given signal, and return with a fish, which they never attempt to swallow without permission. These birds were formerly kept in England for the same purpose. Charles the First had his master of cormorants, as well as his falconers.

In Hindoostan is a very singular bird, called the Bengal grossbeak. It is remarkable for its sagacity, its pendant nest, and its brilliant plumage. Dr Buchanan says it is a fact that these nests are lighted at night by fire-flies. The bird fastens a bit of clay to the top of the nest, and sticks a firefly on the clay, as if to illuminate the dwelling which consists of two chambers; but the real object probably is to deter the bais from approaching, as they kill the young of these birds. The blaze of light dazzles the eyes of the bats. The gross-The blaze beak is said to resemble a sparrow in shape and in the color of the back; but the head and breast are yellow. They make a chirping noise, but have no song. They associate in large communities, and cover extensive clumps of accacia and Indian fiortrees with their nest; and also the palmeira, or wild date, on the leaves of which the Bengalese children learn to write. They prefer trees that hang over a rivulct. The nest is made of long grass, which they weave almost like cloth, in the form of a large bottle. It is divided into three chambers, and is suspended firmly to a flexible branch, with the neck downward, so as to secure the eggs and young from serpents, monkeys, squirrels, and birds of prey. The eggs of this little bird resemble large pearls. They are wonderfully faithful, sensible, and docile, Coffee House Books from Port Deposit. Most of and never voluntarily desert the place where their

taught to fetch a piece of paper, or any other small thing that is pointed out. So great is their dexterity that if a ring be dropped into a deep well, the bird will dart down with such amazing celerity, as to catch the ring before it touches the water; they will bring it up with apparent exultation. The Hindu name for the bird is Baya. The young Hindu women at Benares wear thin plates of gold, called ticas, slightly fixed, by way of ornament between their eye-brows. Mischievous young men train Sugar Maple, Black Ash, Butternut, Beech, Elm, & the Bayas to go, at a signal given them, and pluck The land yields first rate crops of Grass, Rye, Oats, Ba the pieces of gold from the foreneads of the women, by, Potatoes and Flax; and on some lots, good Whe as they pass through the streets, and bring them to and Corn may be grown. To those wishing to obtain a their employers.

The following experiment seems to prove that the common house-spider possesses a natural divingbell, to assist it in crossing water: a spider was River townships. The land is admirably well waters placed on a small platform in the middle of a large there being out few lots which have not durable running. tumbler full of water. The creature first descended by the stick that supported the platform, till it reached the water; but finding no way to escape, it returned to the platform, and prepared a web, with which, by means of its hinder legs, it loosely enveloped its body and head. It again descended, and without hesitation plunged into the water, when my uncle observed that the web contained a bubble of air, probably intended for respiration. An ingenious Massachusetts, who are in thriving circumstances. The German managed to produce a gossamer veil woven above described land is offered for sale at the very by by spiders. He contrived to spread his little manu- price of from two dollars and a half to three dollars pe facturers over a large glass, and contrived to place them so that the work of each was connected with that of its neighbor. As he could change their progress at pleasure, he was not only able to form the veil of a tolerably regular shape, but by inducing them to go several times over the same spot, to give them to go several times over the same spot, to give it something of the appearance of flowered lace. The whole veil, though of a large size weighed only indisputable, and good Warranty Deeds will be given three grains and a half; and a breath blew it up into the air, where it floated like a cloud.

ANECDOTE. - A gentleman of the bar, in a neighboring county, in easy circumstances and pretty good practice, had rendered himself somewhat remarkable by his attempts in the way of matrimonial speculation. A maiden, rather advanced in years, residing some miles distant, hearing of this lawyer's speculating propensity-that his character was unexceptionable, and his life tolerably good, resolved upon making him her husband. She hit upon the following expedient: She pretended suddenly to be taken very ill, and sent for the man of the law to draw her will. He attended. By her will she devised £10,000, in bank stock, to be divided among her three cousins, some thousands, in bonds and notes, to a niece-and a vast landed estate to a favorite nephew. The will being finished, she gave the lawyer a very liberal fee, and enjoined secreey upon him for some pretended purpose-thus precluding him from an inquiry into her real circumstances. Need I mention the result? In a fortnight the lady thought proper to be restored to health. The lawver called to congratulate her on her restorationbegged permission to visit her, which was granted. After a short courtship, the desired offer was made. The bargain was concluded and ratified. The lawyer's whole estate, by his wife, consists of an annuity of sixtyfive dollars!-English paper.

PLANTING TREES.-Farmers would do well to plant trees along the roads and about their houses. for ornament as well as use. The white mulberry might as well be set out in the vicinity of their houses to make silk from. From this tree may be derived both ornament and profit.

Evidence of Trade.—The Philadelphia Gazette of Thursday says :- During the last three days, upwards of forty arrivals, have been registered on the the vessels thus recorded brought produce from the young are hatched. They are easily tamed, and Susquehannah country. Twenty thousand barrels taught to perch on the hand. They may even be of flour have also been received by these arrivals.

Valuable and Cheap Land-for Sale.

The subscriber offers for sale, 14,000 acres of chot Land, situated in the town of Pinckney, county of Lev and state of New York. Some of the land is improvement under cultivation. The country is remarkably he. tin, being entirely free from the fever and ague and free the common bilious fevers which often afflict the tow upon Lake Ontario, this town being 18 miles east of it lake. The soil is principally a sandy toam, much of covered with rich black mould. The timber is chief perior grazing farms, a fine opportunity now offers itse The produce of pasturage and hay from an acre of the land, is very large, fully equalling if not surpassing th from the same quantity of land in any other of the Blac streams upon them. The land is well adapted to Orchan ing-the Apple tree thriving very well in this count Stock of all kinds may be disposed of with the least pos ble trouble, and to the greatest advantage, the drove purchasing at the very doors of the farmers, and pavis the highest cash prices for their cattle, which will readi find purchasers at all seasons of the year. Several famers at present residing on this town, were original acre, for the uncleared land, and from three dollars and half to five dollars and a half for the improved lots. T land will be sold in lots to suit purchasers, and from tr to five years' eredit for payment, in annual instalment will be given. As a further convenience to purchases the subscriber will receive in payment, Cattle, Sheep purchasers. Persons desirous of purchasing will pleas to apply to the subscriber, at Henderson Harbor, count of Jefferson, State of New York, or to DAVID CANFIELD Esq. on the town. JAMES H. HENDERSON. March 9. ep16t

der before planting. My ground was dry, and WINTER BUTTER, SHORT HORN CAT-TLE, &c.

Mr Editor-Much has been said in the N. E. came as dry and hard as if lying in the barn. Farmer about freezing the milk to obtain cream for butter. My objections to this practice are, the butter so made is inclining to be white, will not sell well, and is crumbly and will not cut handsomefind the copperas any protection against by. Besides, I think the flavor hardly equal to that

> Our object has been to keep the milk in a temperature always above the freezing point-say, not

lower than 40 or 45 degrees.

sich injured my corn, and from which I generally to me by that great friend to agricultural improve-know that some very good mileh cows of the imget the seed sooner) sowed Lucerne and red-good color and flavor. The practice also saves state, bushed them in, and rolled the ground down labor and cold fingers. We have in this way had oth. I put on at the rate of more than 20 lbs. no butter that was not as high colored as what I ferme seed to the acre. The oats, though send you. But perhaps the high color may be d and harrowed in before, had not then sprout- owing considerably to the extra richness of the milk, The land was a dry rich loam, made mellow and this quality of the milk is wholly attributable to think as good for Incerne as any in this vi- the cows, My stock consists of the Short Horn 1. It came up well and grew well, till the breed in the blood of Calebs, Denton, and Holdat began to choke it: they grew very rank and erness, the Herefordshire in the blood of SIR ISAAC, x y one half lodged. The lucerne then turned the Bakewell, and that excellent, though undefined w, and seemed to dwindle away, and for a breed introduced here from England by Charles

I am aware that much contrariety of opinion dot appear very promising. It is now nearly exists as to the properties and relative value of the ead, and the little that remains is generally in different breeds of cattle, and my intentions have

year's experience will enable me to judge, I am in-maining balance on the cost of the mill, might be e result of this experiment has satisfied me clined to think the improved imported races (the lucerne will not answer for our soil and Short horns, particularly,) the most profitable,—that te. No doubt it may be profitably grown in is, taking them for all purposes. I do not know places. I did not attribute my failure to the that they will give any more milk than the 'natives,' but it is, I believe, generally of a better quality, and they certainly keep in much better order on the same food. They are also put together more on mechanical principles, are stronger, and have better constitutions. I would recommend to every farmer to give them a fair trial.

SANFORD HOWARD. Yours with respect,

Vaughan Place, Hallowell, April 18, 1831.

FOR THE NEW ENGLAND PARMER

MILCH COWS.

Mr Fessender-I am much obliged to your correspondents Colonus and W. for the notice they have taken of my communication of March 2; But I perceive I did not make myself perfectly understood. The fact is, I cannot afford to buy the best cows in Massachusetts; much less to import them from Switzerland, Lapland, or China. I wish to be gradually increasing and improving my stock of milch cows as I may be able either by crossing the best I now have with better stocks or now and then buying young cattle,

I did hope to profit by the experience of those who have tried the imported races of cattle, if it is found to be true that a much larger proportion of any of them are actually better for milk than native eattle.

The communication of Colonus is interesting; The method which we have practised, and but it appears to be historical fact, and not his own which I think best for winter, was recommended experience, 'H',' refers to agricultural reports, I ment, Charles Vaughan, Esq. as followed in ported breeds, have been exhibited at the Cattle the counties of Somerset and Devon, England. Shows. But does the experience of Massachu-The milk immediately after it is taken from the setts farmers prove them to be decidedly better cow, is put in a copper or brass vessel, of a size than the native, with the same treatment? In ... according to the quantity of the milk, care being Governor Lincoln's letter to Col. Jaques, in your taken that it is not more than eight or ten inches paper of March 9th, he speaks confidently of the in depth, and gradually brought to within 2 or 3 entire difference, in different breeds of cattle, beaving seen Lucerne strongly recommended degrees of boiling heat, when it is permitted slow- tween utter worthlessness and great productiveare New England Farmer and in many other by to cool. In the course of five or six hours, the ness and value.' This is the best authority, as I odicals, I determined to give it as fair a trial most of the cream rises in a beautiful thick sheet, am told he has a large stock of different breeds of could. Accordingly I, last spring, prepared and is so solid that it may be cut with a knife in horoed cattle. If he has found by his experience, at 40 rods of land, on which the year before almost any form. It comes to butter almost imany breed remarkable more especially for the pro-1 about 80 bushels of corn to the acre, sowed mediately, never requiring more than five minutes' duction of milk, the information would be of great th oats, and on the first day of May, I could channing. The butter is of fine quality, being of importance to the agricultural interests of the Yours &c.

A Rustic.

WIND-MILL AT SOUTH BOSTON.

Mr Fessender.-I am much pleased to learn. that the Directors of the Boston House of Industry propose to erect a wind grist mill. I have thought much of the subject; and previous to the suggestion in your paper of the 13th ult, had made a rough calculation, which satisfied me, that the whole cost would be saved in one year. I am now confirmed in the correctness of my estimate. The toll, saved upon 5000 bushels of grain, would be 3125 bushels; which at the present average price of corn and rye, would amount to about 235 dolas scattered here and there, wholly insufficient been, and still are, to go through with a series of lars. The whole carrying expense to the Dorchester tide mill or to the Mill Dam, will amount to So far as several years' observation and one nearly or quite as much more annually. The regained, by grinding for those of the inhabitants of S. Boston, who send their grain to mill; if the Directors would accommodate them. This would be to them also a great saving and convenience. L. C.

Yours respectfully, South Boston, May 10, 1831.

SPORTING.

Ma Fessenden-Permit me, through the medium of your highly useful journal to call the attention of our farmers and horticulturists to the wanton practice of many young men from Boston and its environs, of shooting the birds in this vicinity.

crease of worms and insects in making ravages safest and easiest way with little trouble or ex- for them to go through. In truth, there can be no upon our fruit trees and fruit, not only paralyzes pense, and also I hope with a greater certainty difficulty in having plenty of honey, if we devote the efforts and disheartens the hopes of the cul- of keeping clear of the bee moth, from the great- any time to making a house for the bees. tivator, but threatens total destruction to many of er elevation from the earth than the usual method, the most delicious kinds,-So extensive are their ravages that but very few of our apricots and plums long been expecting, and now give it to you for ever ripen without premature decay from the worm publication, generated by the beetles which surround our trees in the twilight of the evening in great numbers when the fruit is quite young. And when the JOHN PRINCE, Esq. produce of our apple, pear or peach trees is small, but few of these escape the same fate.

I attribute the rapid and alarming increase of these worms and insects wholly to the diminution of those birds which fall a prey to our sportsmen, which are known to feed upon them and for whose subsistence these insects were apparently created,

In addition to the important usefulness of these birds, their musical notes in the twilight of the morning are peculiarly delightful; awaking the cultivator to the sublime contemplation and enjoyment of all the infinite beauties of creation.

In vain will be all our toil and labor, in vain the united efforts of Horticultural Societies for increasing and perfecting the cultivation of the most delicious varieties of fruits, unless we can increase, or at least cease to diminish these aseful and melodious birds.

If we have a Statute in this Commonwealth providing for the protection of these birds, let us unite our efforts to arrest this wanton destruction of them by enforcing the penalties of the law in every instance of its violation. Our Horticultural Society can scarcely do a greater service in promoting the objects of its organization, than by making a spontaneous and vigorous effort to this effect.

If there be no Statute for the protection of these invaluable ereatures, I would earnestly, yet respecifully suggest to the Horticultural Society the propriety and even necessity of their petitioning our Legislature at their next session for such an act.

It is a common practice with these sportsmen through the summer to range the groves and orchards, in this vicinity, almost every pleasant day and more numerously on holidays, and to shoot every bird that comes within their reach.

It is not however a small nor an easy task for one individual, to get thei names, residence, and the evidence necessary for their conviction; but it requires the united efforts of all who are immediately interested. Already have these sportsmen commenced their wanton destruction of these useful creatures, even before they had time to build a nest for rearing of their young .- Birds that have survived the dreary winter in a more genial clime, having now returned to bless our efforts by their industry and to cheer our days with their meloly, are scarcely permitted to commence their vernal song, ere they must fall victims to a WANTON IDLENESS that is as destitute of moral feeling, as of A CTLTIVATOR. useful employment.

Brookline, April 31.

BEES,

Mr Pessenden-In a communication made for your paper a few days past on this inexhaustible subject, I regretted not having received an answer from a gentleman in the western country to whom I had written last autumn on the method of keeping Bees in the upper part of a house, leaving holes in the wall for them to go out and in for raw silk. Whereas he can make it into sewin or any other building. I do not enter into any contro- at, having a door in the back or front, as you please. versy concerning these valuable insects, or the best We also have the hives placed in the top of the frying pans' of Messrs. Du Ponceau and D'Home

It is a well known fact that the alarming in shaped hives. My object is to obtain honey in the porticos or porches boring small holes in the plant

I have this week received the letter I had so

Roxbury, April 12, 1831.

VERSAILLES, Woodford Co. Ky. April 20, 1831.

My DEAR SIR-Your friendly letter of October last was forwarded to me at this place, but did not reach this until my departure for the southern counties; consequently this is the first opportunity I have had, and must plead my excuse for not attending to your request sooner; and now, I have to regret that my friend Doct. Parker has not furnished me with all the information I require, concerning the management of Bees; but he has kindly afforded me an opportunity of examining his Bec-house, and if I possessed the power of description you should certainly have it, intelligibly. This much is certain, that he has in the garret, a great number of bees. He thinks about 40 swarms at this time, all proceeding from one hive, put there about 10 years ago. He placed the hive near the brick wall or end of his garret leaving an aperture, or small hole in the wall, through which the bees passed out and in. A tight room was then made for them, such as may be made in the end of any house, leaving a door, which may be locked or holted. The room must be tight, admitting neither air or light, or very little of either. A large hox was then put into this room, say 8 by 4 feet, one half sawed in two, with small hinges on it, and fastened at the bottom by a bolt or lock, for the convenience of raising up and getting the honey whenever you may want it. The hive being placed on the top of the box, and the latter having 5 or 6 holes bored in it by a small auger-as soon as the bees have filled the hive, they go down into the box, and never swarm until they have completely filled it. But you must have room enough in your house to keep them always at work. And this you may do by adding box to box; and they will even then proceed to deposit their comb on the rafters of the house.

Doct. Parker told me the other day, that he could now take from 50 to 100 wt. of honey comb without disturbing, or even seeing a bee .-- We have also a Bec-house in the yard; 3 sides planked up, as other framed houses are, we have framed a box the whole length, say 14 feet; this box is 18 inches wide and about 12 deep, with holes bered all along the top, over which the hives are set or placed-the front part of this box is full of holes for the egress and ingress of the bees-they directly go up through the box into the hives, fill them, and then go to work in the large box, so that you may take the lave off as soon as filled and place another there, so that there is no necessity of ever killing a bee .- You can fasten the hives on the box, by running a bar of iron or wood through each end of the house and putting a lock on it, so as to prevent robbery .- The lock is placed in the end of the bar, outside of the house.

We have several other plans, or methods of raising bees in this neighborhood-such as small brick buildings, and putting the hives in them,

P. N. O'BARNEM. PROSPECTS OF AMERICAN FARMERS.

The probability of a general war in Europe ap proaches very near to certainty. That it will be one of terrible carnage, may be inferred from the nature of the two great parties in it, despotism and liberty, and from the fact, that it is to decide the fate of the former; but its probable duration is no so clearly indicated-it may be a war of twelve months or twelve years. As members of the human family, as philanthropists, the people o this country will regret this state of things; a republicans, they will feel intense interest in it but as a nation, we have little to fear, and nothin, to lose by it. Its effects will be felt in this countr to an important degree, and by no class of peopl more than the farmers. It will create a deman for bread stuffs, and thus enhance the value c agricultural products immensely. If the war doc become general, the probability is that the ensuin harvest will be the most valuable one to farmer that has been reaped for many years. We mus not be considered as wishing for a war of blood shed and devastation in foreign countries, that ou own may be benefited by it-far from it; but suel is to be the unfortunate lot of our neighborn nations, without any act of ours, no good reason ca be seen for our not preparing to furnish them wit suc) supplies as their necessities may require, an when they must obtain somewhere. As we might it be argued, that it is improper to prepar wrecking vessels to assist shipping unfortunate cast away by the fary of the elements, with a vie to salvage, as that we ought not to look for, at even prepare for the suthership of this general we As well might it be said that we should not ta advantage of our neighbor's necessity by selling him bread, because he stands in need of it. O thing we hope our farmers will not neglect; at that is the Lusbanding not only of their harves from which they have reason to expect so muc but of their gains also from this source. Whe our planters and farmers, not many years since were reaping such rich harvests, from a simil cause, they seemed to forget that there could be change in their circumstances, and consequent as fast as their money 'came in at the door it w shovelled out at the window.' The probabili is, that there will be a state of agricultural prospe ity fully equal to that of any period since we b came a nation; and it is to be hoped that its ben fits will not be squandered .- American Farmer.

AMERICAN SILK .- A correspondent of the Ne York Journal of Commerce writes from Londo as follows :- I forget to mention to you some tin since, that the American silk offered here for sal was bid in at public auction. The price limited at 14s, but only 1.3s, 9d, was offered. Th manufacturers however speak well of it.'

Here we have the best commentary that can l made on the assertion, that it is ruinous for us 1 make sewing silk, mits, gloves, &c, out of our got silk; and that we ought to export our raw sil At 14 shillings a pound in London the America producer would scarcely realize more than \$2.1 slik, and thread for mits, stockings, &c (those 'go)

one!) and obtain from five to seven dollars a pound busine a better selection for mileb cows. Farmers ecording to quality. We hope to hear no more f exporting our raw silk, and importing the manfactured article. If the process of manufacturing ewing silk from raw silk is to double the value ix - then let us have the advantage of it - Ib.

MILCH COWS.

The attention of farmers is invited to the con- them hold out, ideration of the character and condition of our ailch cows.

orth her keeping? What is the average time that raste of fodder among us by keeping animals that ield little or no return of profit? - Questions like iese, and there are many such, ought to be put nd answered in the New England Farmer, It nay turn out that our dairy stock is extremely low reharacter and its management wasteful.

If something like an average quality of milch ows could be settled-to effect a standard-and should be understood that no good farmer would eep an animal for milk that fell below it; all the ows in the country would soon come up to that andard and go beyond it.

A milch cow of medium quality in this state will ve, it is supposed, 12 quarts of milk per day for vo months after calving, and about 7 quarts per ay on grass feed for the next four months, and ur quarts per day for the next following two onths, and perhaps 2 quarts one month longer, ltogether 1500 quarts in a year,

It takes 9 quarts of milk to give a pound of butr, and 4 quarts to yield a pound of cheese. The im milk and dairy whey may be valued at 82 a w per annum,

Now, a cow that gives 1500 quarts of milk in a ar, will produce 166 lbs. of butter, worth at 16 nts per lo. 826 56 3 44 tim milk, say

\$30.00

Nothing is said of the worth of the calf, as all emilk the cow gives is credited. .

A milch cow's keeping one year cannot be short 25 dollars in the interior,

Suppose a farmer to resolve that he would keep cow that did not hold out as a good milker 9 onths in the year-and that did not give sixteen arts of milk per day for 2 months after calving, d 12 quarts per day the next 3 months, and 2 arts per day the mouth following,-Such a cow ould yield per annum 3000 quarts of milk,

Here it may be remarked, that with the addition five dollars per annum to the cost of food as esnated for a common cow, the neat profit would obably be four fold.

Is it not practicable to have throughout the couny, as common dairy stock, animals as good as the st described ?

This question is submitted to farmers for contter.

ock. More young stock would be retained to ding event .- Norfolk Beacon.

would think more of the advantages of employing bulls of the improved breeds. Heifers should be milked with great care and very thoroughly, to get them in the habit of holding out as long milkers. f the material -that is, to make three dollars worth If they once dry early, no care and keeping afterwards will correct this fault. Heifers with the first calf will be fed well with some additional care the last three months they are in milk, to make

The profit of a milch cow is not generally understood. Milk is not only the most nutritions but How much milk ought a cow to yield to be cheapest article of food. The food necessary for a cow in full milk, does not exceed in price, one ur cows are in milk? Is there much, if any, third of what is necessary in feeding for the butch-

> These few remarks are hastily made to draw out farmers, and particularly scientific farmers, on this subject: There are a great many facts to the purpose, which should come to light,-Mass. . lgri. Rep.

A MARKET FOR COCOONS.

The Editor of the Amerian Farmer is authorized to say that any quantity of cocoons will be purchased the ensuing season, by a gentleman who is preparing to erect a filature in Baltimore. - From forty to fifty cents a pound will be given for them, according to quality.-Particular care should be taken in killing the chrysalis that the fibre of the coroons be not injured by heat, and that all the crhysalis be certainly killed. If the cocoons be put in to a tin vessel, the cover closed perfectly, and the vessel be placed in a kettle of boiling water for half an hour, the chrysalis will be all killed and the cocoons receive no injury from too high a heat as the water will prevent the temperature rising above the boiling point.

We have thought it proper to give this notice that those who have been deterred from raising silkworms by the absence of a market for cocoons might be induced to commence. At forty cents a pound cocoons will be a very profitable article. One person with a boy to assist during the last ten days, can attend to one hundred thousand worms, which, if well attended to, -kent clean and well fed with mulberry leaves, will produce 300 pounds of cocoons, which will bring at the minimum price \$120, and if really first quality, which they will be by proper attention, they will bring \$150,-and the time occupied will not be over six weeks.-What more profitable employment can females pursue. The gentleman will give notice in a future advertisement of the place at which the cocoons will be purchased. In the meantime the Editor will take pleasure in giving all necessary information on the subject .- All letters must be post paid, -. Imerican Farmer,

YELLOW JASMINE.

We announce, with deep sympathy in the affliction which the event visits on her fond parents, and leration. The probability is that in taking some in the hope that it will operate as a solemn warnins to get stock as good, they would get even ing to young persons, the fact, that Sarah, the interesting little daughter of Mr John D. Gordon, aged If the various modes of obtaining this object about 4 years, was poisoned yesterday from eating ere resorted to at once and with zeal throughout yellow Jusmine flowers. The child, we learn, was e country, there would be a prodigious improve- in good health at the breakfast table, went out ent in a very short time. No young animal of and came home an hour or two after, to breathe omising appearance for milk would go to the her last in the arms of her parents, who are overtcher. More care would be taken of young whelmed with grief by the sudden and heart ren-

BARLEY.

The two rowed barley, if it can be had, is decidedly preferable for mellow ground-if not the four rowed is next to be preferred .- It should be prepared by steeping in cold water some twelve hours, carefully skimming all the oats and foul stuff which rises to the top of the steen; the water may then be drained off; and the barley thrown into a heap upon the floor, where it must remain twelve hours; then some house ashes are to be mixed with the barley and sown immediately three bushels to the acre. Barley from clay land should be sown on sandy or alluvial soil, and vice versa. The time for sowing is from the 20th to the last of April,

I am aware that this manner of treating seed barley is very different from the customary mode; but let the farmer act upon these instructions, and I shall endeavor to sustain the propriety of them in a subsequent essay by what I conceive to be sound reason, - Genesce Farmer,

MEDICINE.—We have just heard of a man, who very honestly and conscientiously, takes brandy and loaf sugar, as a medicine for those complaints which have usually been treated in this way, Probably he does not know the fact himself, but his friends know that he becomes in reality, intoxicated in this manner almost every week of his life! What shall be done for him? The pledge of the Temperance societies runs-' except for medicine.' He takes the medicine only when the disorder returns. He takes but just enough to remove it-but he takes enough to render him an inebriate. Is there no remedy? Is there not, in the whole range of materia medica, a proper substitute? Has hearen inflicted Physical evils on man which it is his duty to remove, and which ean only be removed by MORAL degradation? Who can believe it ?- Gen. of Temperance,

CLEANLINESS, - Cleanliness is a mark of politeness, for no one unadorned with this virtue, can go into company without giving manifest offence. It may be said to be the foster-mother of affection. Beauty commonly produces love, but cleanliness preserves it. Age itself is not unamiable, while it is preserved clean and unsuffied. Cleanliness is intimately connected with purity of mind, and naturally inspires refined sentiments and passions.

THE BLOOD ORANGE.

'The date tree I observed ; but though it reaches a considerable size in Malta, (some specimens of which I have seen being ten or twelve yards in height.) it is not made to bear. The walks and plats for the Grand Master's Gardens] were literally strewn with oranges and lemons. They seemed left to perish: although in better times the product of the gardens from oranges alone, is said to have yielded the reign-. ing Grand Master two thousand Maltese crowns annually, a sum about equal to one thousand dollars, The blood orange which is the boast of the island, is a most deheious fruit. It is produced by grafting the slips of the common orange on a pomegranate stock. The pulp inclines to the color of red, but not so much in mass as intermixed in streaks; and hence its name. It is not only more luscious but less husky than the ordinary varieties of orange, and in size it is far surpassing. The blood orange sells in Valetta for eight pence a dozen, while the best of other sorts may be had for four pence.'—Bigelow's Travels.

Pennsylvania Canal .- Boats from Philadelphia have arrived at Harrisburgh, via the Schuylkill, and the Union and Pennsylvania Canals.

ON THEUSE OF LEAVES AS A MANURE. BY R. K. MEADE.

The great importance of leaves as a manure has frequently been alluded to in the Farmer, but never recommended in such a manner as to furnish serious ground for a calculating and practi- leaves is as follows : after designating the ground alcal farmer to go to work-the nearest approach by a New England farmer in collecting them for the barn-yard, was by throwing them into a tent and thence into a wagou-a plan so far removed from efficiency as to damp the enterprise of nine or harrow, scarify the earth on each side lightly, per acre in consequence of the manuring, out of ten who would attempt it. I have been the width of the leaf-hed; with the back of a handsuccessfully engaged in converting them into manure for several years past, under the feet of shovels cover them an inch or so deep. This ophorses, cattle, sheep, and hogs, and find the follow- eratio i should be performed when the leaves are ing prominent reasons preceding others for their use, and for the attempt to promulgate this essay, ation should be made in the spring months to an

1st. A belief that there is a general neglect of the use of leaves as a material for manure,

2d. The almost universal use which might be made of them

3d. Their importance as a material to keep up thus prepared they may be transported at any time a system of operations for a seasonable supply of manure

4th. Their salutary influence in affording a comfortable bed for all kinds of stock, particularly for hogs; freeing them from the mange-and their valuable substitution when straw is scarce for ice-houses, &c.

5th. The importance of their removal from the fence corners in case of fire, and to preserve the rails from rotting.

6th. Their qualities are as a material for manure, as tested by experience in its application generally, but particularly in its adaptation to the wheat dered at, under the different plans and systems crop in spreading it broadcast on the rough fallow, attempted.-Large ox carts discharging their and harrowing it in before seeding, &c. Some loads by a tilt, or one horse carts, are by far the object to the use of leaves from the fear of injuring the forests-it will be proper to show why high sideboards, &c. Four pronged forks, with the there is no reason for such apprehension. If the scripture truth with regard to the falling of the tree was verified in relation to the leaf, there might be an argument urged in their removal. that Peter was robbed to pay Paul-but it is certainly not the case-the tree lies where it falls, but the leaf is driven by the most prevalent winds iuto some deep valley, the lee side of declivities. or into the corners of a fence where they moulder earth neatly pushed up, the fourth in the cart to into dust, rendering no service to man or heast, receive and tread them firmly down. One ton, every exertion to introduce cleanliness into their permitting leaves to bank up against fences is son of the season, may be carried at each load in passed by a cottage where all the fences about the premature decay. If by any prudent forethought or arrangement the leaves could be a plantation in reference to its altitude and expo- ing. As an evidence that I have given this mode unless everything corresponds with it does not sure to the most prevalent winds, their removal of increasing the manure bank a sufficient trial, have a more pleasing effect than a coat of whitewould never be recommended, because it is rational permit me to say that I have in the course of a wash well laid on. The cost of doing it is trifling to conclude that the forest requires a return of its year used more than one bundred loads. But and it can be done by the females when the men foliage, however abundant, to keep up a supply of once for all, let it be kept in mind, that in the are very much engaged in putting in their spring food for its powerful growth and absorption, and pursuit of this system of increasing the stock of crops. It adds much to the health of the family to detain with greater security the moisture so much manure, no risk should be run, detrimental to have the house whitewashed as often as twice a to be valued in our dry climates and waving lands; the forest, for all its alluring advantages, one of year and by giving the out-houses and fences a but it is enough for us to know here, the undoubt, which has appeared very conspicuously in the coat in the spring many insects are destroyed, and ed fact, that millions of tons of leaves are annually last autumn, and although it is a fact which the their bounts are broken up. One of the cheapest deposited in some place and lost to all intents and ory of some will combat, it nevertheless stands and best modes of preparing the whitewash, is to purposes for the want of either a proper know- as an evident confirmation of its truth. Six or use skim-milk with new slacked lime. This renledge of their useful application, or the skill and seven acres of land were covered with 130 ox ders it adhesive, and it does not fall off as quick industry to haul them to the farm-pen. Our rea- cart loads of this leaf manure, and a fraction less as when the lime is wet with water, Genesee son and observation would be given us in vain, than seven gallons of wheat sowed per acre—it ap- Furmer,

of employing the resources of nature to advantage

were permitted. The process of supplying the farm vard with ways a prudent distance from the roots of trees, which might possibly be injured by their removal, rake them up into winrows from eight to ten feet wide, then with some kind of plough, cultivator rake shove the loose earth to the leaves, and with wet and the earth light and loose. This preparextent of the probable demands of the farm-pen for the season before you, but may be done at any time most convenient for the farmer if the leaves are not too dry. The importance of having a sufficient supply of leaves ahead, is, that when whether wet or dry to the farm yard, which should be done at periods of from four to six weeks apart, and spread about six inches deep, as uniformly as possible to receive the animal manure-double this thickness will not be too much for an early winter preparation mingled with straw and cornstalks-in the spring the leaves will be incorporated with the great mass of manure. The process of hauling them to the farm-pen is important to be considered, as many have laughed at the idea. saying you might as well attempt to haul feathers in an open cart; and it is not much to be wonmost expeditious mode of conveyance, with very teeth slightly curved and flatted, composing a frame about two feet square, are used to lift the leaves, and will raise as many as a man can conveniently heave into the cart, weighted as they are with the adjoining soil, and kept continually wet or damp, by the covering of the earth :- four hands are employed to a large ox cart, two with forks, one with a rake to keep the leaves and

our 'talent' would be hidden in the earth, if the pears to be abundantly thick, and by comparison neglect of some of the most apparent opportunities with experiments made last year, no doubt will prove so in time of harvest-on the same ground, without the aid of this well pulverized manure, ten or twelve gallons of wheat per acre would have been required to have produced the same verdure and apparent thickness; and as to its ultimate production there is no doubt of the great superiority of the thin sowing and manuring. There is then a saving of from three to five gallons of wheat But it will be urged by many an industrions

> farmer, that there is not time to collect the materials for this additional stock of manure, and haul it out in proper place, cultivating at the same time the usual quantity of land, If this really be the case, unhesitatingly let it be recommended that a few acres be detained in grass, in order to afford opportunity for the important work of manuring. At this time of day it would appear superfluous to recommend or exhort our farmers to the accumulation or application of manure, since the practice of ages, and our every day experience tells us it is indispensable; but to investigate the value, and recommend the more liberal use of a much neglected material amongst the varieties presented to our choice, can scarcely be doubted as important to the improving condition of the farner. A brief hint of another mode of using leaves may be important to some-carry them immediately on your knolls to the cow-pen, and from ter to twenty loads per acre-double the ground may be gone over in the season, and more effectually manured, as half the period will suffice to keep the pen in one place-the leaves preserve their moisture, and save much of the manure from exhalation. It may be well, Mr Editor, now to come to a close-your patience and my pursuits should be considered, though a two feet snow permits the farmer to do but little more than feed the stock and sled a little wood. But be assured that if this leaf subject were done justice to, supported by numberless remarks connected with it, too long for one essay, the practice and science of manuring might be benefited beyond ordinary calculation, and far beyond any feeble attempt of your friend and humble servant .- Amer. Farmer.

WHITE WASHING.

As spring is a time country housewives make and benefitting only a portion of soil which may more or less in proportion to the quantity of earth department, we would particularly recommend never be called into cultivation - but the habit of mixed with the leaves, and their weight by rea- whitewashing, as well out doors as in. Who ever highly injurious to them, evidently producing an ox cart or wagon to the farm-yard—the speed gardens, the out houses, &c, were whitewashed, with which this loading is done, and consequent without being impressed with the idea that the infilling up of the farm pen is truly encouraging to habitants were cleanly and respectable? To paint detained just where they fall, which may in some one who looks to the improvement of his soil, board fences white with lead and oil is a costly degree be done by an attention to the clearing of through a generous and regular system of manur- business and looks a little like extravagance and

PRESERVING EGGS.

It this season, eggs are plenty and cheap but blect that next February and March they may is dear as they have been the past season, viz. eighteen to twentyfive cents per dozen. It be good economy therefore, to lay down eggs the season of scarcity. For this purpose, take ssel of sufficient size and fill it with strong water in which put fresh eggs; let them be perfectly covered by keeping a piece of board ed with sufficient weight upon them to keep an inch or two below the surface. In this mer eggs may be kept two years.—Another at one mill near Chambersburg, Pa, this season. nod is to dip them in melted bees wax, tallow arnish, or a solution of our Arabic, by which pores of the shell are made tight. Either ned as may suit the convenience of the house will render them suitable for long keeping.

PUMPKINS.

e believe this crop is more neglected than ght to be. Whether this is owing to the ant phrase of Brother Jonathan and Pumppie,' used by our transatlantic brethren we v not. But this is certain, that a given weight easure of Pumpkins contains more nutritions er than the same quantity of turnips, and they et as difficult to keep. For feeding to milch in the fall, we do not know of a better artiecording to their cost; for feeding to beef catev are excellent-and when boiled, and a Indian meal added to them, for feeding hogs most kinds of food, - We hope therefore instead of running mad about raising Ruta t our farmers will look carefully to raising kins, for without them the emigrants from ecticut would make but sorrowful work 12 Thanksgiving.—Ib

1's of Bacon,—One establishment at Cincini had on hand 100,000 pounds of hams and lers; another had 'barrelled and baconed.' thousand hogs during the last winter.

Mezzotinto was invented by Prince Rupert, in the time of Charles 1st, 1649. It was suggested by a fusil, which had rusted in the night-dew, and gave the idea of producing a smooth black impression by means of a steel roller with projecting points, to cover the plate with an infinity of small holes. The rough surface thus produced, being scraped away at pleasure, leaves the various gradations of light .- Mass. Jour.

NEW ENGLAND PARMER.

BOSTON, WEDNESDAY EVENING, MAY 11, 1831.

POULTRY.

Continued from page 334.

THE GOOSE .- This species of birds, is divided into two varieties.

1. The firus, Gray Lag, or Wild Goose, that inhabits the fens and lakes of the northern parts elegant schooner called the 'Piper,' has of America, Europe and Asia,

2. The monsuetus, or Tame Goose, or the Gray

The flesh of the goose is stimulant, hard but palatable, and a favorite dish with the epicure. But it is not proper food for those who lead sedentary lives, whose digestive powers are not in the most efficient state, or are troubled with eruptions or diseases of the skin. The fat of the goose is thought to be peculiarly penetrating and useful in softening and discussing tumors, &c, and is generally, carefully preserved for domestic applications. The goose attains to a great age, and there are well authenticated instances on record of their living to the extent of 70 and 80 years.

A new breed of geese, called Bremen Geese has been introduced from Germany into the United States, which we are told is decidedly, and considerably superior to any heretofore known in this country. They were first imported by Mr James Sisson of Warren, R. I. who received a premium from the Rhode Island Society for the encourage- them thoroughly fat. A goose fattened entirely as right. Take away the fuel, and the fire ment of Domestic Industry, for the exhibition of

geese of this breed. They are said to possess the following advantages over any other animals of their kind :- They grow to a greater size, may be raised with more facility, are fattened with less grain, and make more delicious food

The last Philadelphia edition of Willich's Domestic Encyclopedia, states that 'There is a valuable breed of this fowl in the southern states, from a mixture of the largest Gray Goose with the Wild Canadian Goose, (.Inas Canadensis.) They are much larger than any sort of tame geese, and in their cry and manners resemble the Canadian

Breeding .- 'One gander' according to Loudon, 'is generally put to five goese?' but Willich says three of these birds are usually allotted to a gander; for if that number were increased the eggs would prove abortive. The nest should be prepared as soon as the female begins to carry straw in her bill. The number of eggs to each goose for setting should be about twelve or thirteen. While the goose is setting, some writers direct to place corn and water near her. London, however, observes that 'feeding goese upon the nest is seldom required.' The gander should at this time, have free access to the goose to guard and accompany her. The nest should be made of straw, and so constructed that the eggs will not roll out, as the sitting goose, it is said, turns her eggs every day during the period of incubation; a period, according to London, of from 25 to 30 days. It is unnecessary to take any of the goslings from the mother as hatched; but pen the goose and her broad at once on dry grass well sheltered, putting them out late in the morning or not at all in severe weather, and always taking them in early in the evening. The first food may be similar to that recommended for the duck, such as barley meal, bruised oats, or fine pollard, with some cooling green vegetables, as cabbage or beet leaves intermixed.

Rearing .- At first setting at liberty the pasturage of the goose should be limited, otherwise, if permitted to range over an extensive common, the goslings will become tired and cramped, and some of them will fall behind and be lost. As the young become pretty well feathered they also become too large to be brooded beneath the mother's wing, and as they will then sleep in groups by her side they must be well supplied with straw for beds, which they will convert into excellent dung. Being able, says Mowbray, to frequen the pond and range the common at large the young geese will obtain their living, and few people, favorably situated allow them anything more. excepting the vegetable produce of the garden. But it has been his constant practice always to dispense a moderate quantity of any solid grain or pulse at hand, to the flocks of store geese, both morning and evening, on their going out and their return together, in the evening more especially, with such greens as happen to be at command: cabbage, mangel wurtzel leaves, lucerne, tares, and occasionaly sliced carrots. By such full keeping his geese were ever in a fleshy state and attained a large size; the young ones were also forward and valuable breeding stock. Geese managed in that manner, will be speedily fattened green, that is at a month or six weeks old, or after the run of the corn stubble. Two or three weeks after feeding on stubble land must be sufficient to make on the stubble, is to be preferred to any other; since

an over fattened goose is too much in the oil-cake least for the summer support of all his teams and renewed beds of straw, plenty of clean water, oats in his farm-yard, he will find it a most profitable antly and speeddy,*

(if you would fatten goese you must shut them in reaping instead of mowing; and, if the spaces: Having been convinced that it was suited up when they are about a month old, and they are kept truly clean [from weeds and other grasss] my soil, I last year laid down an acre and a que let them have always by them in a small rack adhering to it and carried to the racks. If drilled bly adapted to that purpose. Unid it down w ing. But for fatting older geese it is commonly by horse-hood, which would cradicate grass far the barley stalks very short, or else I should to done when they are about six months old, or soon better than any barrowing that could be given to have been able to thresh it, so thick and succelle after harvest, when they have been in stubble a broad-cast crop, without a formidable expense, was the lucerne. I cut over this field once a a good way. But those who desire to have them the roots are. The grand object in the preparavery fat, shut them up for a fortnight or three tion of the ground is to have it as free from weeds, cause the French writers speak of it as a very n weeks, and feed them with oats, split peas, barley and especially grass, as skill and perseverance can occurrence even in their climate, that it will bear meal, or ground malt mixed with milk. But the effect. best thing to fatten them with is malt, mixed with and keep them in health, that being commonly their sickly time."

FARMER'S WORK FOR MAY.

FLOWER SEEDS.

Packages of Flower Seeds, of eighteen varieties, comprising the most showy annuals, among which are the following beautiful and comparatively rare sorts; Elegant Coreopsis, Variogated Euphorbia, Cypress Vine, Candytuff, sweet seented Virgin's Bower, Sensitive Plant, &c, &c, with directions for their culture .- Price \$1 per package.

The Old Sherman Morgan Horse,

This Horse so well known in Vermont and New Hamp-bure, will stand the coming season, at the 'TEN HILLS STOCK FARM' in Charlestown, Mass. 23 miles from the city of Boston, viz. at one dollar the mare to be paid to the groom at the time of covering, and a conditional Note, to be received, for fifteen dollars, to be paid, if the mare is in foal; all mares parted with, before the usual time of foaling, will be considered in foal, and the note to be valid. These are the only terms on which this Horse will be allowed to cover.

The Stock of this Horse is so universally known and admired throughout New England, that it is hardly necessary to repeat their merits. To a seller of Horses, it is only necessary, to establish the fact, that his horses are of the Morgan Stock, and be meets with a ready sale, at good prices, and the purchasers are more than satisfied. They exect in great endurance, carrying weight a long distance, noble and generous spirited, with a docility of temper, that the most timid can drive them, but it put to their mettle, they are a full hand for the best whip .-It has been asserted (and I believe it cannot be contradicted with propriety) that there has never been a Stock of horses in New England, which have proved to be so generally useful, as the Morgan stock. They have often excited the admiration of strangers. The above remarks are particularly made for those at a distance, who have not an opportunity of viewing for themselves; for those who have, the Sherman Morgan needs no praising.—Pedigree, &c. hereafter. SAML JAQUES. i.ig.—Pedigree, &c. hereafter, May 1st, 1831.

The Naturalist,

DEVOTED to Geology, Botany and Mineralogy, edited by D. Jay Browne, and published monthly by Peirce & Parker, 9 Cornhill, Boston. Each No contains 32 8vo pages, accompanied with a plate. Price \$2 a year. The first five numbers of this work have been i-sned, the contents of which are as follows; Zoology, Man. contents of which are as follows; Zoology, Man. VOUNG WYE COMET.

April 13.

The subscriber informs those disposed to improve their stock, that this fine full blood animal will be under his care this season. Terms §2. Apply to A. GREEN-WOOD, near Dr Codman's Meeting-house. April 20.

For Sale or Exchange,

A valuable mare, with foal by one of the best studs for draught horses in the country; she will be exchanged at a bargain for a first rate family horse. Apply to J. B. Russell. 3tis April 20,

Cash will be paid for any number of copies of the New England F. rmer, No. 41 of the current volume-Printers with whom we exchange, who do not file their papers, will oblige us by returning them.

. Igricultural Seeds.

For sale at the New England Seed Store, 52, North Market street, Boston,

Buck Wheat; Perkins' Early Seedling Potatoes, (that took the premium from the Massachusetts Forticultural Society); Burnham's Premium Potatoes, (that have twice taken the premium from the Essex Agricultural Society, as the best stock potatoes raised in the county); Early Manly Potatoes, (originally from Europe); Grass Seeds of all kinds, &c, -ill of the very first quality. ASPARAGUS ROOTS.

Several thousand plants of the Large Early Devonshire Asparagus, 3 years old, price 75 cts per hundred, well packed in moss, in boxes of one, two, and three bundled roots each.

Also, Catawba, Isabella, White Sweetwater, Black Hamburgh, and other kinds of Grapes, well packed in moss, so as to bear transportation hundreds of miles with s lety-price 50 cts each. Large Tart Rhubarb Roots, 25 ets each.

Sweet Potato Slips, &c.

This day received at the Agricultural Warchouse, 52 North Market-street, a further supply of Sweet Potato Slips—Price 17 cents per quart; 50 cents a half-peck.— Also, a fresh supply of Millet and Orchard Grass seed.

For Sale.

Silk Worms' Eggs, warranted good, price 50 cents per thousand, with short practical instructions for rearing Silk Worms, by J. H. Cobb, which are given to purchasers. Apply at the New England Farmer Office.

Yellow Locust Seed.

Just received and for sale at the Seed Store connected with the New England Farmer Office No. 52 North Market Street,

A tew lbs. gennine Yellow Locust Seed, (Robinia pseudoacacia) saved near Harrisburg, Pa. expressly for this Establishment. The excellence of this tree for ship timber and fences, its rapid growth, and its beneficial effects on sandy, barren plains, where it thrives well, are too well known to require comment.

Cow Cabbage.

Just received, at the Seed Store, No. 52 North Market street, from London a small quantity of Seed of the Cow Cabbage; it is thought that no plant cultivated in this country will give so much folder from the same space of ground, for Mdch Cows, as this It has been successfully cultivated to a large extert in New England and the Middle States the past year, and promises to be a great acqui-

Dr Hull's Putent Truss.

DR HULL, Sir-Under the advice and direction of DR KNAPP, I have been cured within the year past of a had rupture of 9 years' standing, by the use of one of your patent trusses. I had worn various kinds of trusses before I got one of yours, but they were very burdensome to me. Your truss, on the contrary, is comfortable to wear, and as convenient to put off and on as a pair of spectacles. I wore it not to exceed five months, and found myself cure !. I have not had it on for six months past, and have excited myself violently at wrestling, umping, riding, and other hard exercises without any return of the complaint, not even a feeling of weakness in the part. In fine, your truss has made me as sound and well as ever I was; it is one of the most valuable H. N. FISHBURN. inventions in the world.

BALTIMORE, Jan. 1831. Dr Hull's Trusses are sold by Eben. Wight, (sole

agent for this city,) Milk-st. opposite Federal-st. Feb. 11. eop3t

BRIGHTON MARKET-Monday, May 9.

[Reported for the Chronicle and Patriot.]

At Market this day 208 Beef Cattle, IS Cows and Calves, 12 Sheep, and 116 Swine.

PRICES .- Beef Cattle-The market today was quite brisk and last week's prices were well supported; more good Cattle were at market, and more were sold at our highest quotations. We quote the same as last week, from \$5 to 5 75, extra at \$6.

Cours and Calves-We noticed sales at \$10, \$15 two at 18, 21, 23, two at 25, one at \$28 50 and one at \$30.

Sheep-No sales noticed.

Swine-We noticed the sale of one entire lot of 100 at 5 cts.-At retail, 5c. for sows and 6c. for barrows.

HAY has risen in the Boston market to from 75 to 80 cts

MISCELLANY.

THE SPRING JOURNEY.

BY BISHOP HEBER.

Oh green was the corn as I rode on my way, And bright were the dews on the blossoms of May, And dark was the sycamore's shade to behold, And the oak's tender leaf was of emerald and gold.

The thrush from his holly, the lark from his cloud, Their choros of rapture sung jovial and loud; From the soft vernal sky to the soft grassy ground, There was beauty above me, beneath, and around.

The mild southern breeze brought a shower from the

And yet, though it left me all dripping and chill, I felt a new pleasure as onward I sped,

To gaze where the rainbow gleamed broad overhead.

Oh such be life's journey, and such be our skill, To lose in its blessings the sense of its ill!

Through sunshine and shower may our progress be even.

And our tears add a charm to the prospect in heaven!

TOBACCO.

(Extract from Professor Stuart's Letter.)

But I must return to myself, in order to answer some of the inquiries which you make respecting the results of my own efforts to break off from tobacco. After the conviction which ensued the reading of Dr M'Allister, I thought it must be a duty for me once more to make the effort to break off. Two things were and are clear to me; (1) Tobacco, having powerful and fatal properties, must, or at least may be, a dangerous thing to tamper with; or as Dr. Mussey of Hanover once told me, "It is not safe to play with edged tools," (2) What other good can tobacco do, than the onium-eater can plead for, and urge as a reason for continuing their practices. I came therefore to a resolution to desist. But how seemed to be a question of more importance and difficulty, than you will admit who never, I suppose, have been addicted to using tobacco. I had seen veterans in the use of it, suffer seriously in their health and spirits, for a time, in consequence of abruptly breaking off from it. The reason is obvious, Their system had been brought, by long habit, to discharge a great quantity of saliva fluid by the mouth. When the occasion of doing this was wholly removed, the whole system must undergo a change in its economy. Sudden changes, and such great ones, they could not well bear. - Younger persons can endure them much better. But men of grey hairs should look well how they make sudden changes, in cases of such a nature.

"I thought it not safe to break off wholly at once. But I did this; I broke off until hankering became oppressive. I then procured some of the most detestable tobacco that it was possible to find, and took some of it. It generally nauseated me in a very short time; and this was exactly what I wanted. In this way, the appetite would occur more seldom and when it did occur, the gratification of it would admit of but very little indulgence. I cannot say that others need this gradual process; I hope they do not, I am sure that young persons, and men, of robust health, do not need it. They can break off at once without any danger, because they can bear great changes. But veterans would do well to take some precaution, when in a valetu-

dinarian state.

It is impossible for those who have never used tobacco, even to imagine the strength of the appetite for it, when once fully formed. I cannot suppose that the thirst for ardent spirits exceeds it in strength. But that it can be overcome, I do believe. My own case is yet too recent to boast of it. My full persuasion is, that it is my duty to break off. Occasionally I am persecuted, even now with the baneful appetite. But its power is evidently diminished; and if my reason remains, it will never have the rule over me again.

'As to all those who use a little tobacco, I suppose they are in the same plight with that in which I have been myself. They do not use it, I suppose, less than once a day; and this was my ordinary measure. That it has been mischievous to me, I have not the least doubt, on looking back upon my past experience. That it can in no ordinary case, be proper to use such a powerful and dangerous substance as a luxury, every candid man, it seems to me, must feel inclined to admit. Of course my mind is fully made up to abandon it altogether.

Ingenuity Rewarded .- A Mr Reynolds, of Bristol, R. I. has invented, after much laborious research, and under that worst of all discouragements to ingenuous mechanics, poverty, a machine for manufacturing wrought nails. Mr R. under all his embarrassments, by the dint of study and perseverance, has brought his machine to such perfection that it will take from the rod and deliver 200 wrought nails in a minute, superior in every respect to nails wrought on the anvil. The ingenious inventor and his associates have sold the exclusive right of the machine to a company in Philadelphia, and have received as a compensation the liberal sum of \$100,000.

PIRON, the celebrated French satirist, was once brought for some midnight frolic, before a Divisional Commissionary of Police, who sternly asked him the to gratify the senses? A thing which the sot and usual questions-his name, his profession, &c; of which he was no sooner informed than he changed his tone, and assuming a smiling countenance, said - Ali! Mr Piron, the poet-we are all friends here ; for I too have a brother who is a poet.' 'That is very likely,' returned the satirist, 'for I also have a prother who is an egregious block-head.'

> REASON FOR WIDOWHOOD. - Mr Crotchet was left a widower, with two children; and, after the death of his wife, so strong was his sense of the blessed comfort she had been to him, that he determined never to give any other woman an opportunity of obliterating the happy recoilection. - Crotchet's Cas- packing is requested.

It is said the Penacock Indians, who were a formidable tribe in this vicinity, used to predict the weather from the movement of the morning fog, which usually passed off in the direction towards the mountains. 'If (said they) the fog goes a fishing, we shall have fair weather; but if it goes a hunting look for a storm.' This saying is not uncommon among the fishermen at the present day.

On Miss Long.-She was a beautiful young lady: but so short, that she was when alive called the Pocket Venus, or Love's Duodecimo. Her epitaph concluded, Market Street. alluding to her size:

Though long, yet short; Though short, yet pretty long.

Men are born with two eyes, but with one tongue, in order that they should see twice as much as they say; but from their conduct one would suppose that they were born with two tongues and one eye; for those talk the most who have observed the least.

In the morning think what thou hast to do; and at night, ask thyself what thou hast done.

Valuable and Cheap Land-for Sale.

The subscriber offers for sale, 14,000 acres of che Land, situated in the town of Pinckney, county of Le and state of New York. Some of the land is impro and under cultivation. The country is remarkably h. tan, being entirely free from the lever and ague and h the common bilious fevers which often afflict the tor upon Lake Ontario, this town being 18 miles east of lake. The soil is principally a sandy loam, much o covered with rich black mould. The timber is chie Sugar Maple, Black Ash, Butternut, Beech, Elm, ! The land yields first rate crops of Grass, Rye, Oats, B ley, Potatoes and Flax; and on some lots, good Wh and Corn may be grown. To those wishing to obtain perior grazing farms, a fine opportunity now offers its The produce of pasturage and hay from an acre of t land, is very large, fully equalling it not surpassing t from the same quantity of land in any other of the Bl: River townships. The land is admirably well water there being but few lots which have not durable runni streams upon them. The land is well adapted to Orcha ing-the Apple tree thriving very well in this coun Stock of all kinds may be disposed of with the least pos ble trouble, and to the greatest advantage, the drov purchasing at the very doors of the farmers, and payi the highest cash prices for their cattle, which will read find parchasers at all seasons of the year. Several f mers at present residing on this town, were origina from the New England States, and some of them for Massachusetts, who are in thriving circumstances. T above described land is offered for sale at the very le price of from two dollars and a half to three dollars ; acre, for the ancleared land, and from three dollars an half to five dollars and a half for the improved lots. T land will be sold in lots to suit purchasers, and from t to five years' credit for payment in annual instalmen will be given. As a further convenience to purchase the subscriber will receive in payment, Cattle, Shee Perk, Grain or Grass Seed, for which products he wallow the highest cash prices. The title to the land indisputable, and good Warranty Deeds will be given purchasers. Persons desirous of purchasing will plea to apply to the subscriber, at Henderson Harbor, coun of Jefferson, State of New York, or to DAVID CANFIEL Esq. on the town. JAMES II. HENDERSON. NEW ENGLAND FARMER.

PUBLISHED BY J. B. RUSSELL, AT NO. 52 NORTH MARKET STREET, (AT THE AGRICULTURAL WAREHOUSE.)-T. G. FESSENDEN, EDITOR.

VOL. IX.

BOSTON, WEDNESDAY EVENING, MAY 18, 1831.

NO. 41.

COUMANACTACAS.

The tollowing article was received some time since, nd should have had an earlier insertion had it not been nislaid. It appears to be the production of a practical ultivator who has tested his theories by actual experi -

FOR THE NEW ENGLAND FARMER.

ON THE CULTURE OF INDIAN CORN. raising Corn on green sward, and he plants no lyisable to plant any other ground with corn. I lands. n opposed to this opinion for the following reaard there is little or no danger of worms injuig them; and if well managed, the crop is likely m obstructions for cross-ploughing and mixing, I with common usage well fitted for a crop of en, without the least hazard of being injured by grub worm, which too often disappoints the ner of his crop. It is certain that corn will a 1, and afterwards much better wheat and grass.1 gan vegetable manure.

in piece of ground in Mr Phinney's mode and which promised the least success.3 ing a wet season he nearly lost his erop. I will briefly explain the causes of these differ-

than cut new furrows, and leave one half un-corn is subject to renewed colds from every rain ploughed; besides, its being much harder for the or dew; hence it cannot thrive. On the other team, it requires twice the attention in laying the hand, if it be ploughed three inches deep, the furrows even, and there is the balk to plough be-sward full of vegetable manure, with the barn tween the rows. The advantage in harrowing, dung, and the rubbish are ploughed in, the soil pulverizing, levelling and lightening the cracks of will lay up light, and the sun and air having their the level-ploughed above the ridge-ploughed, I effect to the depth where the roots will be found consider very great. I had rather tend 4 acres most abundantly, and exactly in their elements, not of the level than one of the ridge-ploughed. Mr suffering from drought nor wet, will thrive beyond I observed a publication in your paper, vol. ix. B. says his neighbor almost lost his crop. But conception. This is the ground and the mode of o. 33, dated Plymouth, Con. March 7, 1831, this must have been because he did not plough tillage that I shall principally pursue the coming ibscribed B. in which the writer states his method (right, not because he did not ridge up his ground.2

In ploughing most level ground for tillage, be ther with corn. I understand him that it is not sure to plough in a direction to drain, and in small

The ordinary mode of tilling low level land n. I will endeavor to show the advantages, with corn is to enter on one side, and plough a hich result from not planting green sward with large flat land; having no reference to draining dian Corn. If potatoes are planted on green it, and paying httle or no attention to the depth of ploughing. Consequently in this moist and soft ground it is ploughed one foot deep. If the man-Now this seems to be discouraging in tilling low ground with corn. But I tell you not to be discorn as close as possible. For this he gives beam; it is far preferable to a roller, as it levels the ground. at reason; but I think there is great reason off small protuberances, instead of jumbling us nst it. I am confident there is great benefit over them like a roller. Plough this ground long, before I tell you that it is much worn down deved from ploughing in vegetable substances, in small lands, in a direction to drain 6 inches by too frequent tillage. Consequently I could not at especially if green. I have known good crops deep. Tend it well, and the probable crop is 40 expect a great crop, especially as I put only 2 of orn without any manure, except those sub-bushels. Add four loads of manure, and put it loads of barn yard manure per acre. This was strees ploughed in. In one instance I doubled in the hill, and the crop will be fifty bushels. Now m crop, side by side, by ploughing one piece a there is encouragement. But plough the ground in the later than the other, from the benefit of with the same apparatus in the same direction 200 bushels, but gathered 300 from about 12 r B. says he spreads his manure and ploughs the same good attendance, and the probable crop new to me. I shall leave it for the reader to round into ridges, leaving a path between is 80 bushels per acre. In this last mode of till-judge for himself the advantage. On my low ground hidges unploughed. I observed his manure age it is improper to put manure in hills. And if I shall drill for my rows 4 or 5 feet distance, as seen spread from before ploughing until hoeing the four loads or more be added and spread care-the land will be much higher manured and not e surface. Every good farmer knows that it fully on sward, and ploughed smoothly in and liable to drought. I am sensible that I get more hus been exposed, by evaporation, the effects carefully harrowed lengthwise with the furrow, so un, air, &e, to a great loss of virtue. At the that you turn back no turf and the whole attendance noeing, Mr B. ploughs or breaks up his balk, be good, you may reasonably expect 100 bushels, if tough, he admits it to be hard hoeing. I common evils excepted. I will observe that these me it is; I have tried a small sample in a sim- remarks are founded on experience, and not on vay, and found it very hard tending my corn, theory. This last mode I much prefer to all , states that one of his neighbors tried a level that I have heard of or tried, and I have tried all

it is seen that Mr B,'s advice is altogether in ert products. In the first and ordinary mode, of ridge ploughing even of green sward for the sward that is full and warm with vegetable on plainly the advantages of level ploughing, roots, especially as they run shoal on this wet in ther cases is equal, and the labor of getting it a little from the effects of it. But there is noth- farmers to change their practice and to plant their ould spreading it the same. Now I had rather ing else to feed the corn, but the wet, cold, naked seed as nigh together as possible, they will be

plough an acre smooth, by ploughing every furrow, clods, destitute of any kind of manure, and the season.

> I choose to plant my rows across the lands and furrow, and as the sward rots, a light harrow has a good effect. I plant in a drill, made by a large tooth in a light horse harrow or a machine for, that purpose. There can be no ploughing among this corn, nor any hill made.

I planted high ground last season, and to guard against drought, and to have my ground well prepared to sow winter rye I made my drifts 71 be as good the second year. The ground of are is spread and ploughed in, without any addition, feet apart, and dropped my corn, single kernels arse will be more clear, and better worked over, say ten fifty-bushel cart loads, the probable crop, 4 inches apart in the drill. A part of it was 3 in by tillage for corn. The ground after the with good attendance is ten bushels of corn to the kernels together, one foot in the drills. One object ato tops are taken away for manure, is free acre. If four loads of old yard manure is put in in tilling this ground in this manner was to have the hills in addition, it is twenty bushels. It is it well prepared to harrow into it winter rye, at seen that I allow but tittle in this mode of tillage, any time when I might think proper, without any But my experience teaches me that it is full enough, other expense. I worked my ground so constantly with harrow, plough, &e, drawn by a horse, as to keep it perfectly clear and mellow, snug up to my g w well after potatoes, though they are very couraged; I am sure those soils are the richest on corn, using the hoe only to clear the weeds round ach against the growth of many vegetables. By our farms, and they can be improved so as to pro- the roots of the corn. By this tilth my ground pating corn after potatoes the farmer obtains duce the most corn as well as most other vegeta | was kept in the most perfect and beautiful order only a more sure but a much larger crop of bles. Cart on the ten loads of good manure, and that can be conceived and without a single cent's spread it even. Plough with a sharp plough cost for the next crop. And I found no obstruc-Ir B. states that he feeds his ground intended with a foot, as we call it, for a guage on the tion in getting in my rye while the corn was on

I will observe that I have not owned this ground strewed in the drills, after dropping the corn. My crop exceeded my expectation. I expected only and the same manure, three inches deep, with acres. This mode of husbandry is somewhat corn from drill than hill planting. But I will give one hint to those who for any reason plant in hills. A general, if not universal opinion prevails that the seed corn should be spread in the hills, and much pains is taken consequently to spread it, and this they say they know to be the best method for a crop. They tell the the corn comes up when alone much stronger and stubbeder, shoots out, and far outgrows that which comes up together. This is true as far as respects the better appearance of the corn, when of Indian Corn. I will endeavor to show manure is turned below the reach of the corn young. But this is not all which should be considered in a crop. The object should he to grow In this triplace it is presumed that the manure grand, and if manure is in the hill it will spring the most corn on the same ground. To convince

erop, I fitted a piece of ground as equally as I could and well for a crop of corn, with old dung loam, but mostly sand. This writer and many in the hills. I fixed a machine with five tree nails, in an even circumference, eight inches diameter and stamped a number of rows, after being levelled, been very successful in raising corn on green sward, and planted my seed earcfully in them. I took a staff and made one hole in a place, in rows fitted in the same manner by their side. The appearance of the corn planted by single kernels was far before the other while young. I am positive that every plant had from two to four shoots each; and I am as positive that there was not one on one stalk of the other; and they also appeared much slimmer. It is easy to conceive that the single planted was vastly harder to tend. This ground was warm and fair for a crop. As the season advanced, and beceme hot and dry, the single planted began to stop growing, while the others appeared to suffer for nothing, and throvebeyond account compared with the single kernel planted, as that was very bushy, and so affected by drought that it produced but small cars, whereas the other had full, large ears. I weighted the corn in baskets when harvested before husked, and found twice the weight from that planted together, and believe there was more difference when shelled, Since that experiment I have taken care to plant my corn, that I plant in hills, as close together as possible. The reasons I give for this great difference in produce from the different modes of planting are, that corn requires a free circulation of air. and a good exposure of the earth to the sun, and a good unobstructed space for the root; and lastly, not to be over stocked with any kind of trary to the common theory, as it is contended of vegetable, of which corn-shoots are the by some writers that the manure loses its strength worst.4

I feel unwilling to leave this subject until I have given a full exposure of erroneous opinions and practices that prevail. A neighbor set out with a full determination to get a premium. His farm was under the highest cultivation; he was in the habit of procuring great quantities of manure and using it freely. In this way he prepared 3 acres of his best ground, and had given out word, with the greatest confidence, that he should get the premium on corn. He considered that his ground was as good as any in the country and he was confident no one would manure as high as he would, and of course his ground ought to be seeded against frost, heavy rains and severe droughts, but high. He also gave his corn the best of attend-, the sod below absorbs the wash of the manure, ance. It throve wonderfully, it was a show, and and thus prepares it well, when turned back, for he appeared to take great pride and satisfaction the next crop. As our new lands are much surer in it. It grew so high and slender withal, that for and more productive of crops, where the vegit could not well support itself. The result was etable mould is all on the surface, the nearer I apthat at harvesting he received only five bushels proach the same principle in cultivating the soil, per acre. A. R.

Portsmouth, N. H. April 11, 1831.

NOTES BY THE EDITOR.

1 Dr Deane, in his N. E. Farmer, expressed opinious similar to those of our correspondent with regard to the inexpedience as a general rule of corn, by S. W. Pomeroy, re-published in the N. planting corn on sward land; and says it is apt to E. Farmer, that gentleman observes, I think cies of maple; suitable for yards and borders. be too backward in its growth and not to ripen four stalks together afford support to each other well. But if we do it on such land, the holes against winds and are not so apt to send up suckshould be made quite through the furrows, and er, as when single, and there may be some setdung put into the holes. If this caution be not vautage by concentrating the manure, in forwardobserved, the crops will be uneven, as the roots in ing the young plants during the cold season, some places where the furrows are thickest will which we frequently have in June.' Judge Buel have but little benefit by the rotting of the sward. likewise says 'Plant your corn in hills. The dis--But if the holes be made through, the roots will tance will depend on the kind of seed and strength be fed with both fixed and putrid air, supplied by of the ground' &c, see page 326, our current volthe fermentation of the grass roots of the turf, ume.

benefitted from less labor and a much better In this way I have known great crops raised on green sward ground, where the soil was a sandy others, recommend a crop of potatoes as preparatory to that of corn. E. Phinney, Esq. has and his methods of culture are described pages 226, 266, of the current volume of the N. E. Far-

> * With regard to ridge ploughing, the following appears to us to be correct. ' When there is reason to apprehend that the ground will prove too moist for this crop, it will be advisable to plough it into narrow ridges, and seed each ridge with one or two rows as shall be most convenient. But ty. Leaves oval, lanceolate, smooth and acute sandy and clay soils should merely be turned over, fruit, nearly double the size of the largest pear in a flat furrow, and not afterwards ploughed so heart shaped and slightly curved; skin greenist deep as to break the furrow. For clay, if mellowed too much will become mortar in wet weather and bake in dry, and the sand will become too loose to support vegetation. Memoirs of .V. Y. Board of Agriculture, vol. ii. p. 20.

> toga Agricultural Society [re-published in the N. | leaves. E. Farmer, vol. v. p. 224, 252,] he gives the details of his mode of culture for Indian corn, and ing catalogue, were received from Doct. S. C other crops, and remarks, shallow ploughing and Hildreth of Marietta in the state of Ohio. Se the application of manure to the surface is con- his letter in the N. E. Farmer of March 23d. by evaporation, when so much exposed to the be cleansed from the oily pulp, by ashes and scraping, be sun. There may be some loss by the exposure, but not so much as there is by ploughing it in deep. I should always wish, however, that the manure after being spread from the wagon might he immediately mixed with about one inch of the surface either with the plough or harrow after rolling, as the decomposition is much quicker when gany tree. it comes in contact with the soil, and in this situation it becomes a better conductor of the vegetable elements to the plant. Keeping the vegetable mould as near the surface as possible, I have found not only a great preservation to the plant the better I succeed in raising crops. I have received more benefit from three loads of manure applied as above than from five, when ploughed in deep.

4 In an able essay on the culture of Indian

Elorticulture.

Proceedings of the Massachusetts Forticultural Society, at a meeting held at the Hall of the Institution, on the 14th of April, 1831.

William D. Hammond, Esq. presented the fruit of the Custard Apple, or Sour-sop, [Junona Muricata,] which he brought from one of the West India islands, and the seeds were distributed among the members.

This fruit is much esteemed by the inhabitants of the tropics; being considered cooling and whole-ome, and is often given to sick persons.

The tree is middle sized, rarely above twelve or fourteen feet high, and never above twenyellow, and covered with spines, or muricates flesh a white pulp, filled with many large flat ova seeds, of a chesnut color; petals ovate, the interi or ones obtas; shorter, The smell and taste o the fruit, flowers and whole plant resemble very 3 Although such shallow tillage is contrary to the much, those of Black Currants. The tree was theory and practice of most cultivators, it is not cultivated in England as early as 1656 by Tra without precedent. Earl Stimson, a celebrated descant, and is now propagated with great care agriculturist of Saratoga County, N. Y. raised by such gentlemen as have appropriate stove very great crops by ploughing but 3 inches in for raising the tropical plants. They are consid depth. In an address delivered before the Sara cred an interesting tree, from the beauty of th

The seeds and scions described in the follow

ORNAMENTAL FOREST TREES. No. 1. Magnolia Acuminata. N. B. These seeds mu

fere planting. 2. Magnolia tripetata; from Fishing creek, Va. for

miles from the Ohio tiver, and forty from Marietta.

3. Bignoma catalpa. One of the most beautiful orn mental trees, when loaded with its large clusters of ric flowers; very hardy and easily cultivated.

4. Liriodendron tulipitera.

5. Gymnocladus obioensis; coffee nut tree, or mah

6. Celus occidentalis; (Hackberry.) Fruit hangi on the tree nearly all the winter.

7. Juniperus virginianus. (Red cedar;) growing mos ly in rocky precipices.

8. Acer sacularinum; a very beautiful shade tree-the the season.

9. Gleditschia triae anthos.

ORNAMENTAL SHRUBS AND SMALL TREES. 10. Circis obioensis, (Red bud;) a very beautif flowering tree, or large shrub-blooming at the same tin with the Corms Florida, and affording a delightful con trast to the pure white of the latter.

It Corner florida; white blossomed.

Cornus florida; red blossomed.

13. Euraymus atropurpurcus; (Burning Bush, h dian nerow-wood;) a beautiful shrub for borders, fl filled with red berries in the midst of winter.

14. Fraxious aromaticus. (Sweet scented ash;) blosson very fragrant. A moderate sized shrub, fit for borders Root aromatic and bitter, good in dyspepsia, and weakne of the stomach.

15. Acer regando. (Box-elder;) Seeds of a small sp

16. Hamamelis virginica; (Witch hazle;) pale yello blossoms, flowering in November, and affording the sing lar anomaly of flowers and fruit at the same time-alar

shinb, suitable for door yards and parks. 17. Stapliyles trifolia, or bladder nut; with pale ye low flowers in spring, and in autumn the branches file with beautifully inflated capsules; 2 varieties-a shru 6 or 8 feet high.

18. Direa palustris; a beautiful shrub, growing in moist, rich seil, northern exposure-and bearing a prof sion of yellow flowers.

19. Genista americana; (.Imerican Broom;) a pret shrub, hearing a profusion of yellow flowers.

FRUIT DEARING TREES.

20. Juglans alba, or Shelbark Hickory of Ohio. These are of the common size, and well worth cultivating.

21. Juglaus nigra. This tree in the rich bottoms, is sometimes six feet in diameter, at the lower end, and attains the height of 80 or 100 feet.

22. Queicus lyrata, or (over cup oak;) growing on the banks of the Ohio and Mississippi rivers, but flourishes well on dry uplands; timber valuable for posts, &c.

23. Dyosporus americana, (American Date.)

24. Anona glabra (custard apple.) 25. Chickasaw Plum, a very superior one, from Granville, Ohio.

26. Crab apple. Seeds of the indigenous crab applewell worth cultivating, for the delicious fragrance and beauty of its flowers.

VINES AND CREEPERS.

28. Parilla lutea. Seeds of the yellow Parilla, a peennial vine, bearing large clusters of purple berries, like grapes, and hanging on the vine through the winter. Leaves large and heart shaped.

29. Rosa multiflora, chioensis; producing a profusion of blossoms, of three shades on the same cluster; one stem seing sufficient to cover the front of a large house.

30. Celastris scandens; a climbing plant; pretty in a order of shrubbery.

31. Bignonia radicans; very common in our rich botoms, and affording a profusion of flowers from May to September.

NATIVE FLOWER SEEDS.

32. Blue Perennial Aster.

33. Seeds of an indigenous Red Lily. The stem from which these seeds were gathered, was 9 feet high, bearing profusion of flowers-37 having been counted on one tem; requires a rich, moist soil, and a little shelter from he sun.

34. A variety of anemone. 35. Button Snakeroot.

36. Indigenous Dracocephalus; from the hills near

Iarietta. 37. Flos adonis; perennial-requiring a shady situation;

olor a rich azure; in October. 38 Asclepias tuberosa. Not inferior to any exotic, for

eauty and permanency of flowers.

39. Gillenia trifoliata. American Ipecacuana. 40. Cassia marilandica; common in the river bottoms ad rich hill sides.

SEEDS FROM MY GARDEN.

41-42. Seeds of the Crown Imperial, red and yellow raised in my garden. An ingenious gardener may erhaps raise from them some new varieties of this suerb flower.

43. Purple Dahlia; raised in my garden.

44. Searlet Dahlia. Seeds of a fine scarlet Dahlia; om my garden.

45. Seeds of a fine Water Melon, called the ' Ice-rind.' 46. Ohio, flat, sweet Pumpkin-Flesh five inches

ick; superior for pies. 47. Sweet Potato Squash; to be cut in pieces and

ked, with the cuticle on like a sweet potato. 48. Extra Early Corn; from the Mandan villages on e Missouri river; fit for eating the last of June in this

imate if planted early. TWELVE VARIETIES OF PEACH STONES

elected from our best fruit, and ripening at different periods.

No. I. Large white freestone Peach—ripe in Sep-

mber.

2. Blood Peach elingstone; medium size-ripe last of eptember.

3. Portugal Peach; a large white chagstone, remark-

ly rich and juicy-ripe in October. 4. Large red and white free stone Peach; very rich ad juicy, weighing from 6 to 11 ounces—ripe first Sep-

mber, a seedling from my garden. 5. Red and orange free stone; very beautiful-ripe

e last of September. 6. Large yellow free stone; a very superior Peach-

oe in August.
7. Large yellow free stone Peach—ripe first Septem-

8. Large red clingstone Peach; weighing from 6 to 8 nces-very beantiful.

9. Red rareripe Peach-ripe in July.

10. White Peach; (free,)—ripe in August; a very autiful Peach, producing white blossoms like a plum. 11. Yellow rareripe Peach-ripe in July; a very fine

12. Fine Peaches, not named-Free stones.

ONE SPECIMEN OF OUR COMMON FIELD CORN.

THIRTEEN SCEDLING APPLES, SCIONS OF WHICH BE PUT UP AND NUMBERED, AS FOLLOWS ;-

No. 1. A yellow apple, above medium size; a regular bearer; ripe in March and April, but will keep sound until July-a juicy, pleasant apple, for eating or for pics. 2 A deep and brilliant red, striped and spotted with

white. Skin smooth and glossy; flesh white, tinged with red; juice lively and aromatic-a fine cating apple; ripe in October, but keeps till January-grew in the orchard of Mons. Thierry, an emigrant from Paris, in the early settlement of this place.

3. Pale red and yellow, flesh yellow, tender, rich and spicy-a great and constant bearer; fit for the table in October, but will keep with care till January; a large

and superior apple for eating.

4. A large red apple; ripe in October, but will keep until December-good for eating er cooking. It has been named by the family of McAllisters, who raised the tice, the 'Lalayette apple.'

5 Medium size, red and orange colored, flesh pale yellow, juicy and sprightly—keeps till late in the spring; good for eating or cooking.—From Mr Middleswart.

6. A mottled and marbled appearance, dark mixed; juice very sweet; medium size, flat-fine for baking or m king preserves; keeps sound until spring .- From do.

7. A large and yellow apple, of the most brilliant and beautiful ppearance; a great and constant bearer-superior for culinary purposes, and a tolerable table apple; keeps till January — From Mr Jennings.

8. A very beautiful apple; spotted on the sunny side like a leopard, red and yellow spots; medium size; flesh white, juice rather acid; keeps well, but more valued for its striking beauty, than excellent qualities .- From do.

9 A large, well formed apple, highly tinged with red; flesh white, rich and fine flavored; ripens in October, but will keep till November or December .- From Mr Gates

10. A good sized apple; yellow when ripe, with a russet cheek; flesh, juicy, aromatic and breaking, and to my taste one of the very best table apples; shaped like a lemon, and by me named the Lemon Pippin; a great and constant bearer; keeps till January; raised in the orchard of Mrs Cook.

11. A seedling from the 'Cooper apple;' a fine large apple, often weighing a pound; one of the most rich, fine flavored, and aromatic apples in the country; in eating from October to January. External appearance like that

of No. 9 .- From the orchard of Mr Cole.

12. A fine large sweet apple—striped with bright red, a little more oblong than No. 7; ripe in October and November, a great and constant bearer; very fine for baking. The tree stands by the side of No. 7, and as the fruit falls on the ground, and intermives from the two trees, it requires a careful serutiny to distinguish the sweet from the sour .- From Mr Jennings.

13. A large apple, nearly the size of No. 4, in the painted specimens; color not so deep; more flat; ripe in October—a superior apple for eating or culinary purposes.

14. Cuttings of a wild plum; ripe in September.

15. Cuttings of a native Gooseberry; fruit covered with spicula; very hardy and suitable for tarts, but not

good for eating.

16. Cuttings of a native grape; growing on the hills in a poor elayey soil, producing its fruit near the ground,

being a small vine compared with the fox grape; it makes a very rich wine. 17. Burlingame pear cuttings,

18. Native crab apple scions; blossoms of the most dc-

licious fragrance. Also, 4 varieties of Peach cuttings-seedlings

Drawings, done in oil, of ten of the apples are packed in the box, with a basket of Ohio fruit, grown last autumn, and painted by Mr Bosworth, of Marietta.

N. B .- The drawings of the apples are numbered on the back of the piece, opposite the fruit represented; and corresponding numbers are attached to the bundles of

Attached to each bundle of Seeds, is a written description of the plant, its blossoms, habit, &c. or semething relating to its qualities, which may be useful to the cultivator. [Published in preceding column.]

Resolved, That the thanks of the Society be presented to Doet, S. C. Hildreth, for the valuable present of seeds and scions, and drawings of several kinds of Ohio fruits which he has so liberally transmitted.

Z. Cook, Jr. Esq. first Vice President, presented scious of several valuable fruits.

Doct, Francis Lieber presented a package of Lentils, which where raised in Germany.

This legume is extensively cultivated by the Dutch and Germans, and is esteemed as one of their most valuable edible vegetables. They are only eaten when ripe and are preserved as a substitute for dry peas and beans,

The Lentils of Egypt were highly valued by the ancients, and are often mentioned in the Bible, Doct, Shaw says those of Alexandria are particularly valuable, and are the principal food of persons of all distinctions; they are stewed with oil, dissolving easily into a mass and making a pottage of a chocolate color. This we find was the "red pottage," which Esau, from thence called Edom, exchanged for his birth-right,' 'When David was come to Mahanaim, Shobi, Machir and Barzillai brought him lentils, among the various articles of food, which were furnished to his hungry, weary and thirsty people in the wilder-

Doct. Lieber has kindly promised to furnish the German recipe for cooking them, when it will be published in the New England Farmer.

Resolved, That the thanks of the society be presented to Doct. Francis Lieber for the addition he has made to our varieties of pulse.

The following letter from Admiral Sir Isaac Coffin was read by the President of the Society.

Philadelphia, May 3, 1831.

Sir-1 should long since have replied to your kind communication of the 6th of last December. had not the gout disabled my right hand.

I nm truly sensible of this additional mark of attention my countrymen have been pleased to pay me, and on all occasions as far as my poor abilities will allow shall be most happy to contribute to the advancement of horticultural knowledge in that part of the United States most dear to me.

I must take occasion to observe, which von can communicate to the parties most interested, that I have no doubt the ravages annually committed by frost on our Islands in Boston Harbor and not the sea, may be easily and successfully arrested by planting hardy trees of the Pmastre tribe facing the sea on Deer Island, Long Island and George's

> I have the honor to be, Sir, Your humble servant,

ISAAC COFFIN, Admiral.

GEN. H. A. S. DEARBORN, Pres. Mass. Hort. Fociety.

Clark's Patent Wagon continues the transportstion service between Boston and Montpelier, and is approved by the driver. It started from Boston on Saturday, with a cargo of four tons, which was drawn over our pavement with ease and at good speed by two horses, the driver sitting on the wagon with long reins. The wheels are seven feet in diameter, each wheel acting on a short and separate axle established outside of the wagon. The wagon is thus permitted to hang low between the wheels, and is loaded with peculiar convenience. The accident of upsetting, which sometimes occurs to other wagons, can hardly happen to this.

Population .- A list has been published in many of the papers purporting to contain the names of the towns in the United States, of more than 5000 inhabitants, with their population. This list is quite imperfect, and the statement of population incorrect. Three towns in this State, of over 5000 inhabitants, each, are omitted, viz. Gloucester, which has 7513, Nantucket 7202, and Middleborough 5008. There are 15 towns of this class in Massachusetts.

The late Hon. James Lloyd bequeathed \$5,000 each to the Asylum for Indigent Boys, and to the Female Orphan Asylum, of Boston,

THE PLEASURES OF A GARDEN.

Not be alone, remarks a celebrated moralist, is to be esteemed a henefactor to mankind, who makes a useful discovery; but he also, who can point out and recommend an innocent pleasure, friendly alike to morals and to health. Of this kind chiefly owes its origin and its improvements to the protect the plants after they are set out. are our emotions arising from the observation of two last named poets, Milton and Pope. Lucan nature; and they are highly agreeable to every taste uncorrupted by vicious indulgence.

Rural scenes, of almost every kind, are delightful to the mind of man. The verdant plain, the flowery mead, the meandering stream, the playful lamb, the warbling of birds, are all capable of ing his study; but with all his taste and fondness misfortune is, that the greater number of us are solicits no passion. The darkest habitation in the of his grounds, which should have been the amusedirtiest street of the city, where money can be earned, has greater charms, with many, than all himself in such troubles, by the expenses it occasionthe freshness and luxuriance of an Italian land ed, as necessarily excluded tranquil enjoyment. scape. Yet the patron of refined pleasure, the best adapted to delicate repose; and even the severe philosophers of antiquity, were wont to discourse in the shade of a spreading tree, in some cultivated plantation.

It is obvious, on intuition, that nature often intended solely to please the eye in her vegetable productions. She decorates the floweret that furnish ample and pleasing employment for an springs beneath our feet, in all the perfection of individual during those hours not necessarily devoexternal beauty. She has clothed the garden ted to the ealls of business or of duty. The opwith a constant succession of various bues. Even erations of grafting, of inoculating, and of transthe leaves of the tree undergo pleasing vicissi- planting, are curious experiments in natural phitudes. The fresh verdure they exhibit in the Spring, the various shades they assume in Summer, of contracted dimensions; and that they are pleasthe yellow and russet tinge of Autumn, and the ing as well as curious, those can testify who renakedness of Winter, afford a constant pleasure member what they have felt on seeing their atto a mind enamored with the picturesque. From tempts succeed. 'Amusement reigns,' says Dr the snow-drop to the moss-rose, the flower-garden displays an infinite variety of shape and color if the amusement of managing a garden were The taste of the florist has been ridiculed as trifling; yet surely without reason. Did nature bring forth the tulin and the lilv, the rose and the honeysuckle, to be neglected by the haughty pretender to superior reason? To omit a single social duty or vicious in-door amusements, or which is wasted for the cultivation of a polyanthus, were ridiculous, in bacchanalian festivity, spent in the open air, and as well as criminal; but to pass by the beauties in active employment-in other words, in the lavished before us, without observing them, is no cultivation of a Garden.-Journal of Health. less ingratitude than stupidity. A bad heart finds little amusement but in a communication with the active world, where scope is given for the indulgence of malignant passions; but an amiable disposition is commonly known by a taste for the beauties of the animal and vegetable creation.

Among the employments suitable to old age, Cicero has enumerated the care of a garden. It requires no great exertion of mind or hody; and its satisfactions are of that kind which please without agitation. Its beneficial influence on bed in the ordinary way with fresh stable manure. health, is an additional reason for an attention to Spread over the manure an inch or two of sand, it at an age when infirmities abound. In almost or light earth; then lay your potato parings with every description of the seats of the blessed, the skin up close to each other, so that the whole ideas of a garden seems to have predominated. forcing bed may be covered, and cover the parings The word Paradise itself, is synenymous with with light earth two inches deep. Water the bed should also be taken to trim off all the sprouts garden. The fields of Elysium, that sweet region frequently, and protect it from the frest by cover-but one, or two at most, from a vine of ordinary of poesy, are adorned by the ancient writers with ing with mats or straw when necessary, and let it size the first year after setting, and the tops of all that imagination can conceive to be in this way be exposed to the sun and air in moderate weath- those should be pinched off by the middle of delightful. Poets have always been charmed with er. When the plants are two or three inches high, August to allow the wood to ripen more perfectly the heauties of a garden. Some of the most transplant them into rows or drills two and a half to enable it to withstand the first winter The

represents the happy pair engaged in cultivating drill, and you will have potatoes earlier and of a their blissful abode. Pope also was distinguished larger size than in any other way. The time of prefor his love and taste for gardening; according to paring the hot bed and of setting out the plants Warton, the enchanting art of modern gardening, will vary according to the time when the last frosts for which Great Britain is deservedly celebrated, are expected, and according to the care taken to is represented by Juvenal as reposing in his gar-three years in succession with uniformly pleasing den. Virgil's Georgics prove him to have been results. The potatoes where what are called in captivated with rural scenes, though, to the surprise of his readers, he has not assigned a book to the subject of a garden. Shenstone made gardenexciting emotions gently agreeable. But the for it, he was not happy in it. The captivating way by cutting and whole, and those from the parscenes which he created at the Leasowes, afforded ings were earlier and larger than those raised in burried on in the career of life, with too great him, it is said, little pleasure in the absence of spec- the common way. From experience he is satisrapidity, to be able to give attention to that which lators. The truth is, he made the embellishment fied that it is useless if not injurious to plant ment of his life, the business of it; and involved the bud to germinate.

It is the lot of few to possess land so extensive elegant Epicurus, fixed the seat of his enjoyment and well adapted as his, to constitute an ornamenin a garden. He thought a tranquil spot, furnish-tal farm. Still fewer are capable of supporting ed with the united sweets of art and nature, the the expense of preserving it in good condition. But let not the rich suppose they have appropriated to themselves the pleasures of a garden. The for seed. possessor of an acre, ave, even of a few rods of ground, may receive a real pleasure from observing the progress of vegetation, even in a culinary plant. A very limited tract, properly attended to, will losophy, which may be carried on even in a garden Young, 'man's great demand.' Happy were it, planted out, as either would be very injurious more generally relished. It would surely be more conducive to health, and the preservation of our faculties to extreme old age, were that time, which is now devoted to indolence or to trifling

From the New York Farmer.

AN ECONOMICAL METHOD OF RAISING EARLY POTATOES.

In the month of February and the first part of March, let the potatoes intended for family use be pared somewhat deeper than usual .- Save the parings by spreading them on the cellar floor, or any other place where they will not freeze or dry up. About the 20th of March prepare a hot or forcing

The writer of the above has made the experiment Pennsylvania, Mercer or Neshanock; any other early kind may answer as well. The same kind of potatoes were planted at the time the parings were placed in the forcing bed, in the ordinary more of the old potato than is sufficient to cause

The greater part of the potato usually planted may thus be saved and used for the cattle. It is nevertheless thought important to select the largest and most perfectly formed potatoes for seed, because they will afford parings suitable for planting, and will probably improve the stock, which will degenerate if small and deformed ones are used

Princeton, (N. J.) Feb. 1st, 1831.

PLANTING GRAPE VINES.

As the season for planting out grape vines in this climate has now arrived, a few directions for those unaccustomed to the culture of the vine may be useful,-Two methods are resorted to for the commencement of vineyards: or for cultivating the most approved kinds of grapes for the table. The first is, by procuring from the nurseryman such as have already taken root, and made one or more year's growth. When such can be obtained, care should be taken that the roots be not dried or frozen before they are to them. Grapes have very long roots therefore much care should be taken in setting, that they may be well laid in; when they have large bunches of fine hairy roots, they should either be cut off or washed in, by pouring a sufficient quantity of water into the hole after it is partly filled. To reduce the soil to a thin puddle, when by shaking the vine, the earth will be filled in amongst the roots; they should then be left until the water disappears, after which the hole may be filled with good rich soil and trodden firmly, about the plants: unless this precaution is take, the fibrous roots being packed upon each other are liable to become mouldy and do the plant material injury. The same effect is often produced by putting manure into the hole dug for receiving the plant : this is a bad practice, and ought never to be allowed. After the vine has been planted out, a little manure spread about it will serve to keep the ground moist in dry weather, and will be found very beneficial .- The first year after planting, a small stake should be driven down by each plant, to which the young vine should be tied as it increases in length. Care pleasing passages of Milton, are those in which he feet apart, and ten inches from each other in the other method commonly practised, is to cultivate

ints from cuttings which have been taken from vine previous to the commencement of the culation of the sap in the spring. The common gth of these is from a foot to a foot and a half. iese should be planted out in good rich earth I where it is rather inclining to clay than sand d a northern aspect is preferable to a south. ry the cuttings in a slanting position nearly ir whole length, leaving the upper bud near the face of the ground. In dry weather they should watered and the ground covered with some irse manure to keep it moist. The American ieties do not take root as readily as the foreign s, but both will grow with case. As cuttings ke but small shoots the first year, it is well over them up the first winter, after which the American and most of the European vines I endure the winters in this district without ng covered .- Geneste Farmer.

IMPROVEMENT OF CORN.

The Editor of the American Farmer, has been eral years in the habit of improving corn by sing different varieties, with decided advantage. f he has a variety with small ears, which he ms good in other respects, he plants it in the s with another kind with large ears that flowers he same time; and at the time of the tassels earing, carefully cuts away the male flowers (or wels) of the large eared kind. By this operation e ears are produced of the small eared kind .-ere are some kinds of early corn which, though ellent in other respects for green corn are very th injured by the coloring matter in their red s. This he attempted to remedy last summer transferring the corn from the red to the white in the same way and he thinks with success. planted sonie of the red cob Tuscarora, which hinks the best early green corn, in the rows h the largest cared while cob sugar corn he ld find, about half and half. As the tassels of sugar corn made their appearance, he efully cut them away, leaving the whole to be plied by the pollen from the tassels or male flowof the red cob Tuscarora. The result was and the Tuscarora corn on the white cob of the ar corn as he desired. From his experiments Editor concludes, that any variety of corn may at pleasure thus transferred to the cob of any er variety that flowers at the same time, and at if a large eared kind can be found that flowat the proper time, the smallest eared kind may made to produce large ears by the above pros. He has not extended his experiments to improvement of the cob of field corn; but, has loubt, that by the same process, the thick cob ome kinds may be improved. Suppose the thick kind were planted in the row with some other usually has a small cob, and the tassels of the er cut off as above directed, would not the ded variety of corn be obtained on the small cob? American Farmer.

The aggregate subscription to the stock of the senectady and Saratoga railroad company is about \$100,000. The capital is only \$200,000, with privilege of increasing it to \$300,000. The missioners met in this city on Saturday, for the pose of distributing the stock, and we underid, apportioned it in about the following ratio, \$75,000 in New York, \$20,000 in Albany, 3,000 in Schenectady, and the residue in Sarga Springs, Ballston, &c .- . Albany . Irgus.

From the American Farmer.

TRIMMING ROOTS OF FRUIT TREES. George Town, (D. C.) 3d month, 1831.

NAMESAKE .- The great benefit of thy extensive Journal is, to communicate results ; and the more Atensive its circulation, of course the more bencficial its effects will be; and especially, if every man will do his duty; (as it has been said Jours Bullo, or some of his subjects, had required his men.) Then each agriculturist may be put in possession of the best mode hitherto reduced to practice, in most, or all the various branches of husbandry, and at the small expense of the American Farmer. And again, each one may examine for himself, and see, whether the crops which he cultivates, are the best which can be adapted to his frost on the morning, the mercury rose suddenly to soil and condition.

But to the subject ; trim before you plant. On the 6th day of 4th mo. 1830, a near neighbor and myself, had each a nice young apricot tree sent us: he took choice; they were then in bloom: we each planted our trees in puddle-that is, we took rich earth, about such as would be considered a good garden soil, and made it so limber with water that it would just run and when we set out the trees in the holes prepared for them, poured the puddle on the roots until they were covered, then filled the holes up nearly even full, with the earth that had been taken out; the trees were planted about nine inches deep. The only difference in our mode of field Rep. planting was this; he planted his just as it came to hand; I trimmed off all that portion of the end of each root, that appeared to have become dry by exposure to the atmosphere; (the trees were about one inch diameter, brought from the same nursery, and carried about three miles;) now see the result. My tree did not appear to have suffered the very least by the removal. My neighbor's tree was sick, and seemed as though it would die until late in the season, then it revived and became green, and looked healthy.

I considered this a very plain case : and thought it one that might be useful to some of the readers of the American Farmer-it may be to all. Every one will see, that the ends of the roots, no matter how small, are in fact the mouths that take in the nonrishment of the tree; and, that if these, by exposure to the atmosphere, become dry, they of course lose their tone, they cannot operate; consequently the tree must suffer for the want of food -and the only remedy is, that the tree must throw out new roots, which according to the course of nature, will each have its mouth, and thus the tree is enabled again to gather food. But if the roots are all trimmed off to the fresh wood, then each one will perform its proper function, and the tree sustain very little or no injury by a removal-and it may be at almost any season of the year.

GIDEON DAVIS. Very respectfully thine,

RAIL ROADS,-One thousand bales of New Orleans Cotton were to have been drawn in 2 trains on the 2d ult., on the Liverpool Railway. Sampson & Goliath, appropriate names, were the steam engines employed. It has been proposed, by means of a small tube, on the line of the Liverpool and Manchester Rail road to convey information as quickly as in conversation. Herschel mentions hearing a low whisper at the distance of 3120 feet. through the water pipes of Paris. The Liverpool Mercury thinks articulate sounds could be distinctly

The Season,-It may be a matter of some interest with some of our readers to compare the forwardness of the spring in successive years. In 1828, the work of gardening began on the third week in April. Peach trees were in blossom on the 28th.

In 1829, front yards with a southern aspect, were green on the first of April.-On the 7th, the frost was still in the ground in the open fields, Gardening began on the fourth week of the mouth, but no trees were in blossom till May.

In 1830, the spring was very early,-It commeneed in March, but was afterwards checked by an easterly wind which lasted with short intervals from the last week in March, till the 14th of April. It was then mild till the 19th when after a severe 70 in the afternoon,-This was the signal for gardening to begin. Peaches and cherries were in full blossom on the 30th of April: apple and pear trees were in full blossom on the 2d of May. The nights in May were bowever so cold, that vegetation on the 1st of June was not farther advanced than in ordinary seasons. There were severe frosts on the 10th, 11th and 21st of May.

How this spring will compare with others, remains to be seen. Thus far it is early as the earliest. Last year the weeping willow began to pnt out its leaves on the 4th of April. The same trees began to be in leaf on the 4th of this year .- Spring-

Preserved Butter. - In the summer of 1827, I had presented to me a piece of butter 21 years old and which to taste and smell, was as tine and sweet as the day it was churned and for aught I know, even sweeter, ' for it was the very eream of butter.' It had been preserved under the following circumstances. A farmer's wife during, very bot weather, had put a large roll on a pewter plate, and tied it over with a white napkin, and lowered it into a deep well to fit it for the table. In withdrawing it, the string broke, and it sunk to the bottom. Twentyone years after, the well was cleaned; during the operation, it got loosed from its imprisonment, rose and swam on the surface to the no small annovance and surprise of the man who was in the well. It was carefully drawn up as the egg of some land or sea serpent, but the good wife soon laid the spook, and explained the mystery .- Genesee Farmer.

It was remarked by the Solicitor General at the Supreme Court in Springfield last week, that he found but one indictment in Worcester county, one in Hampshire, and three in this county; and in other parts of the State, he had found the indictments for crimes surprisingly diminished within two years. He could ascribe this change in favor of virtue and good order to no other cause than the influence of Temperance Societies and the great change in the consumption of urdent spirits .-Springfield Rep.

The Tartars have a singular manner of drawing water from a great depth. A long rope, with a large leathern bag (kept open at the mouth by a hoop,) is let down into the well : the end is fastened to the saddle of a mounted Tartar, who rides off, and by this means draws the water from the well; a person in attendance empties the bag heard from one city to the other through similar while the horseman returns, and repeats the process as often as may be required.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, MAY 18, 1831.

Twentyfive cents each will be given for any number of copies (not exceeding 30) of the New England Farmer, No. 41, vol. IX. published April 27, 1830.

SMITH'S TREATISE ON BEES.

In our last, page 331, we gave a brief notice, with short extracts of An Essau on the practicability of cultivating the Honey Bec, in Maritime Towns and Cities, as a Source of Domestic Economy and Profit. Since that article was written, it has occurred to us that the work merited a more extended, and analytical notice, and a more decided and explicit recommendation,

The objects of this work are well indicated by the following extract from its Table of Contents, 'Method of beginning an Apiary in town. Localities for Bees in Cities. Plan and Elevation of an Ornamental Bee-house in the form of a prostyle temple for glass hives. Swarming. Transferring Bees from one Hive to another. Mode of constituting a profitable family bive. The Bee Moth To extract Honey from the Comb in quantities. To prepare way, after taking out the Honey, Method of managing Stock Becs in winter. To bleach yellow wax. Method of relieving the pain on being Stung. Method of supplying Bees with fresh water. Method of marking particular Bees, in and out of the Hive in order to ascertain their specific employments. Anatomy of the Honey Bee. Physiology of the Bee. The Anger of Bees, Language of Bees, Longevity of Bees, Description of Dr Thacher's Hive. Mrs Griffith's Hive.' &c. &c.

This Essay is written in a pleasing and perspicuous style; it embraces a very important and interesting topic of domestic economy, and will be read with pleasure as well as profit by all whose tastes are not vitiated by Juxurious habits, and time not engrossed by the frivolous pursuits of the votaries of dissipation. The cost of keeping Bees is nothing, but perhaps a hive or two to begin with, a dark, unfurnished empty apartment to serve as a work shop for the little artists, and some manual like that which we would now recommend to public attention, containing concise but plain and practical rules for the management of the little laborers; workmen whose lives are devoted to our service for a compensation so trifling that the poorest cottager in the country, or tenant of a ten feet domicile in the city employ them by millions.

THE BLOOD ORANGE.

Mr Fessenden-Your Farmer of 11th, has just been perused, and I notice an extract on the subject of the 'Blood Orange' which contains the erroneous statement that this variety of the orange is produced by grafting the common orange on a Pomegranate stock.' I have no doubt that silly tales of the kind are propagated at Malta and elsewhere, which has caused the author to insert it, for I have seen many of equal inconsistency promulgated in the public prints. I will state however as a guide against deceptive statements of this kind, that it may be taken as a general to stand alone, when compared with the winters rule, that trees and plants can in but few instances of the last twenty five years. No frost entered be amalgamated by grafting or inoculation be- the ground to the depth of three inches, before yond the limits of their respective genera, and the first great snow, which covered the carth like that all tales of grafting the peach on the willow, a warm blanket. There was no moment during the tion. Per order,

stated however on good authority that the rose has wet meadows.—The effect of this covering (been made to vegetate when budded on the oak and on the orange, but the shoots thus formed were but short lived and perished as soon as the natural sap became exhausted. The course of nature as regards the vegetable kingdom is quite simply and plainly delineated, and there exists little of that mystery to which some pretend. By the exercise therefore of good judgment we may generally attain to correct conclusions, and not find it necessary to rest our faith on fables.

I have only to remark further that my numerous engagements have for some time precluded me from contributing to your columns, but the period is at hand when I shall be again enabled to do so. Very respectfully,

WM. ROBERT PRINCE. Linnæan Botanic Garden, į May 13, 1831.

LEAVES FOR MANURE.

Ma Fessenden-I have just read an article in your paper of the 11th instant, extracted from the American Farmer, recommending the use of leaves as a valuable ingredient in manure. I have long been in the liabit of using say 20 cart loads in a year, as litter for my stables, and am abundantly convinced of their utility. I have found them superior to straw, for absorbing, and retaining the urine, which makes no inconsiderable portion of the strength of stable manure, as is well known to most of my brother farmers. I recollect that some years ago, you published a communication from me on the above subject, with my particular method of collecting and using the leaves. I now take the liberty of again recommending the plan to your subscribers as it is often needful that we have 'precept upon precept, and line upon line,' in husbandry, as well as in Theology.

I am, sir, respectfully yours, Newton, May 14, 1831. J. Kenrick.

Remarks by the Editor-We are happy to avail ourselves of the above intimation, and are under great obligations to Mr K. for his suggestion; which affords additional proof of his will and ability to contribute useful articles for our paper, which are the result of correct theory, tested and sanctioned by actual and beneficial operations, relating to the all important arts of rural economy.

From the Boston Daily Advertiser.

Mr Hale-For very many years, I have been in the habit of sending to your paper the state of the seasons. The last two years, I omitted it, because the same information was communicated to the New England Farmer; but finding that some persons have complained of the omission, because they read your paper, and do not see the N. E. Farmer, I am induced to resume my long continued usage. It is not extraordinary that men, cooped up in the city, should be desirous of knowing what are the prospects of fruit and vegetables for the ensuing year-and there are some philosophical farmers, who are desirous of recording the variations of different sensons.

Let me premise, that the past winter was in some respects very extraordinary-so much so, as the rose on the currant, &c, are mere fables. It is winter in which you could carry heavy loads over

snow was very curious. Plants which are killed in ordinary seasons, survived in perfect vigo The effectupon grasses of all descriptions wo favorable, and I presume equally so upon winte grain. The result was, that the moment the snow was removed, the grass started with undiminishe vigor, and although the months of April and Ma have been cold, yet the grass is more forward that ever I have known it to be at this season. Th same causes have been favorable to the early ascenof the sap of fruit trees. The small fibrous root have not been bound in frost, and the season i very favorable to fruits, as the following compar ison will show.

First blossoming of Cherries

i trat otossoming of Onerics.

1825,	April 25.	1831,	April 23.	

Pears opening their blossoms.

1823, May 3d-1824, May 4th-1825, April 30th -1829, May 14th-1831, May 1st. . Ipples opening Blossoms.

1823, May 19th-1824, May 13th-1825, May 8tl -1829, May 15th-1831, May 6th.

I have not extended my comparison in this publication as far as I have sometimes done, though l have done enough to show that it is one of the earliest seasons, and I can add that it is earlier (on the whole) than any season for seventeen years.

I will merely add, for the satisfaction of the lovers of fine fruits, that the Peaches have survived the winter, but they suffered from the two last years' over abundant crops. Yet there are blossoms enough on them, and the fruit, if the season should be warm, will probably be as much superior in quality as it will be deficient in quantity,

I have never known a more universal and vigorous bloom in the Pears.

The Apples cannot be so well ascertained, but as the crop last year was superabundant, it is almost certain that it will be very moderate this

Cherries, Raspberries, Strawberries, and all smaller fruits, promise most abundant harvests. A ROXBURY FARMER.

Exhibition of Flowers at Horticultural Hall, on Salurday, May 14th, 1831.

A splendid specimen of Musa coccinea, or scarlet flowering plantain tice.

Cactus speciosa, Amarillis formosissima, Kerria japonica, Asclespias curassavila, with many other fine specimens of native and exotic plants, from John Lowell, Esq. Rhododendron ponticum, several fine varieties of Go-

naniums, Tulips and other flowers, from MrJohn Lemist 28 varieties of Tulips, Double flowering Chinese Apple, Cornus Florida, and other flowers, from H. A. S.

25 varieties of Geraniums, Calceolaria rugosa, from David Haggerston.

Fine Tulips, and other flowers, from J. Joy, John Prince, Rufus Howe and N. Davenport.

Notice.

The Standing Committee of the Massachusetts Horticultural Society on Flowers, Shrubs, &c, hereby give notice, that they have fixed upon Saturday next, for adjudging the premium on Tulips. Those members who intend offering for the premium, are requested to have the flowers at the Hall before 10 o'clock, in order that they may be examined by the Committee before exhibi-R. L. EMMONS, Chairman.

May 15.

Massachusetts Horticultural Society.

The Standing Committee on ornamental trees, shrubs wers and green houses, beg leave respectfully to subthe following list of prenaums for the year 1831.

or the most successful cultivation of the Amean Holly; the number of plants not less than r, which have been transplanted, at least, three

for the four best flowering plants of the Magria Glanca, which have been transplanted at

st three years, for the most successful cultivation of the Rhoendron Maximum, the number of plants not than loar, which have been transplanted three

'or the five best plants of the Kalmia Latifolia, ich have been transplanted not less than three

'or the best seedling plants of either of the we, not less than ten in number, of three years \$5 00 wth and upwards,

or the five best varieties of the Chinese Chrys-\$500 nemums, in pots,

or the best half dozen of Talips, or the best half dozen of Il vacinths,

\$200 or the best half dozen of Rannaculus, or the best pot of Auriculas, \$2.00 or the best pot of Anemones, \$2 00 er the best pot of Pinks, 42 00 or the best pot of Carnations, \$3.00

\$3.00

\$3 00

or the best half dozen of cultivated native flow-\$3.00 or the finest Roses, of five different varieties,

\$5 00 \$5 00 or the finest Dahlias, five varieties, \$5.00 or the finest specimens of Camellia Japonica, iscretionary premiums will be awarded by the Comee, on flowers not above enumerated.

er order. R. L. EMMONS, Chairman. lay 18.

Nice to the Members of the Massachusetts Horticultural Society.

t the last special meeting of the Society a vote was ed, directing, that all the books should be returned to h Library, on or before the first Saturday in Jone, and themembers are earnestly desired to comply with the isition. A complete catalogue will be prepared ima lately after the books have been received, and printopies distributed among the members, when the Lian, E. W. Payne, Esq. will deliver out the books, re application of members, in conformity to the Li-Regulations.

the weekly exhibitions have commenced, all the abets of the Society are requested to send flowers, in s and vegetables to the Hall, every Saturday; and h they may be arranged, and the rooms opened to viits, at eleven o'clock, it is desirable that all specimens wided for premium or exhibition, should be placed the stands and tables, as early as ten o'clock.

is only by the liberal contributions of the members, vI have gardens and green houses, that the exhibitions a se rendered interesting and h norable to the Institu-If each person makes it a point to contribute some-5,-if but a single flower, fruit or vegetable, the colon will be large and imposing, every week. Rare, e agnificent specimens cannot be expected from all, u ach member can send at least one or two varieties, flich as he may cultivate, and should not refrain from nenting them because they are deemed common.

e wish to exhibit, from week to week, samples of morticultural products of the environs of Boston, and h can only be accomplished by the generous efforts of benembers. No one should excuse himself, on account ie character or number of the specimens within his co nand. Let him throw in his mite, and the result of be commensurate with public expectation.

ne flourishing condition of the Society encourages us o ntime our labors with renewed zeal, so as to render

t tonly an agreeable, but a useful association.

H. A. S. DEARBORN, Pres. Mars. Hort. Suc. ay 18.

Lead Pipe.

EAD PIPE, all sizes, constantly for sale by LINCOLN bring & Co, No. 110, State Street. 6w. orit 13, 1931.

Bones Wanted.

in and Leg Bones constantly purchased by GEO. RAY & CO. No. 68 Kilby street. ril 20.

Wm. F. Olis & Co.

No. 110, Fancuil Hall Market, have a good supply of Carnation Pink toots, Pine Apples, and fine West India wharf, several barrels of prime Nova Scotia Potatoes, for May 18. Squashes, from Trinidad de Cuba.

Potatoes for Seed.

For sale at the New England Seed Store, No. 52 North Market Street-

A few bushels of the fine seedling potatoes mentioned by the editor of the New England Farmer, vol. viii, p. 102. This is but the fifth year from the ball; they have twice taken the premium from the Essex Agricultural Society. (See Colonel Pickering's Report, N. E. Farmer, vol. vi. page 98) They are represented by the person who raised them, as tolerably early, more than middling hearers, remarkably delicate and mealy, size nearly round, color white, and have but very few protubecauces. A good opportunity now offers to farmers to secure a superior variety of this important vegetable for seed. Price \$1 per bushel. May 18.

Branding Irons, at reduced prices.

Carter's improved Branding Irons, for branding Guide Boards, for sale at the Agricultural Warehouse, Nos. 51 and 52 North Market street. This is a very convenient article for country towns, as it will enable them to put up permanent guide boards at a trifling expense; it is simply by burning the brands into a piece of board, then lightly plane it over, after which give it a coat of white Guide boards made in this way are much more durable than the common boards, and the cost is trifling. The above are offered for sale at 40 to 50 per cent discount from former prices, which will enable all towns to furnish themselves with a very useful article. May 18.

Wrought-Iron Ploughs .- Bar-Iron, &c. Wrought-fron Ploughs, of all sizes .- . Also, A Complete assortment of American, English, Swedes and Russia Bar Iron—American Braziers' Rods—Spike and Nail Rods, Shoe-Shapes-Hoop and Band Iron-Steel of all kinds-Pipe-box and Mould-board plates, &c. constantly for sale by GAY & BIRD,

No. 44, India Street, Boston.

For Sale, Full blood . Mdnerncy and Short Horn Bull and Heifer Calves.

Two Alderney Bull Calves, and one Heif r Calf. Alo, one Bull and two Heifer Calves of the Short Porn or Teeswater breed, alt from full blood imported stock, on 4t May 11. both sides. For terms apply at this office.

Grape Vines.

For sale, at the Seed Store, connected with the New England Farmer Office, No. 52, North Market Street, 103 superior Grape Vines, Isabella and Catawba, being the two leading hardy standard sorts cultivated, of extra size and thrifty growth, packed in moss, price 50 cts. each. A further supply of the Alexander, Winne, Scuppernoug, York Madeira, true Red Bland's and Orwigsburg, (all hardy sorts) are just_received, at the same price.

Al-a, a good collection of the finest Double Mexican Dahlia roots, of the most showy and estermed sorts, from 25 cts. to \$1 each-Also, Jacobean Lilies, Tube Roses, and Tiger Flowers-price 25 cts. each. All the above are now in fine order for transplanting.

BARLEY.

50 bushels two towed Barley, plump and clean for seed, raised by E. H. Derby, Esq. Salem.

BROOM CORN.

Also, just received, a few bushels of prime Broom Corn raised last season in the vicinity of Connecticut river-FLOWER SEEDS.

Packages of Flower Seeds, of eighteen varieties, comprising the most showy annuals, among which are the following beautiful and comparatively rare sorts; Elegant Corcopsis, Variegated Euphorbia, Cypress Vine, Candytuft, sweet scented Virgin's Bower, Sensitive Plant, &c, &c, with directions for their culture. - Price \$1 per package. April 13.

Yellow Locust Seed.

Just received and for sale at the Seed Store connected with the New England Farmer Office No. 52 North Market Street.

A few lbs. genuine Yellow Locust Seed, (Robinia pseudoacacia) saved near Harrisburg, Pa. expressly for this Establishment. The excellence of this tree for ship timber and fences, its rapid growth, and its beneficial effects on sandy, barren plains, where it thrives well, are too well known to require comment.

Nova Scotia Potatoes.

For sale at the Halifax Packet Office, No 26 Foster's seed. Farmers in want of a good variety of this important vegetable, are requested to examine these. 3t

BRIGHTON MARKET-Monday, May 16.

[Reported for the Chronicle and Patriot.] At Market this day 186 Beef Cattle, 9 pair Working Oxen, 18 Cows and Calves, 160 Sheep, and 70 Swine.

PRICES .- Beef Cattle-The Cattle today were not so good as last Monday, but the same qualities brought a little better prices; we shall quote higher, from \$5 to 6, extra at \$6 25.

H'orking Oxen-No sales noticed.

Cows and Calves-We noticed the following sales: \$18, 19, 20, 25, 30, 35.

Sheen-A few cosset weathers were taken at about \$6, a lot of a thin quality at 2 33 a 2 50.

Swine-We noticed the sale of one lot at 51 cts. and one at 51.—At retail, 5c. for sows and 6c. for barrows.

PRICES OF VEGETABLES at Fancuil Hall Market: Asparagus 6 cts. per bunch; Lettuce 1 cts. per head; Radishes 3 cts. per bunch; Rhubarb stalks, for tarts, &c, Scts. per lb.; new Onions 4 ets. per bunch; French Tornips 50 ets. per bushel; Parsnips, do. The stall of War. F. Ortis & Co. No. 110, is abundantly supplied with squashes from Trinidad de Cuba, at 3 ets. per lb. These squashes are of excellent quality, and will keep six months in their present state.

MISCELLANY.

INCOMPREHENSIBILITY OF GOD.

BY MISS ELIZABETH TOWNSEND. The editor of the American Common-Place Book of Poetry, says, 'These lines are equal in grandeur to the celebrated production of Bryant-" Thanatopsis"-nor will they suffer by a comparison with the most sublime pieces either of Wordsworth or Coleridge.'

'I go forward, but he is not there; and backward, but I cannot perceive hun.

Where art thon !- THOU! Source and Support of all That is or seen or felt; Thyself unseen, Unfelt, unknown, -alas! unknowable! I look abroad among thy works-the sky, Vast, distant, glorious with its world of suns,-Live-giving earth,-and ever-moving main,-And speaking winds,-and ask if these are Thee! The stars that twinkle on, the eternal hills, The restless tide's outgoing and return, The omnipresent and deep-breathing air-Though hailed as gods of old, and only less-Are not the Power I seek; are thine, not Thee. I ask Thee from the past; if in the years, Since first intelligence could search its source, Or in some former unremembered being, (It such, perchance, were mine) did they behold Thee And next interrogate futurity-So fondly tenanted with better things Than e'er experience owned-but both are mute; And past and future, vocal on all else, So full of memories and phantasies, Are deaf and speechless here! Fatigued, I turn From all vain parley with the elements; And close mine eyes, and bid the thought turn inward. From each material thing its anxious guest, If, in the stillness of the waiting sout, He may vouchsafe himself-Spirit to spirit! O Thou, at once most dreaded and desired, Pavilioned still in darkness, wilt thou hide thee? What though the rash request be fraught with fate, Nor human eye may look on thine and live? Welcome the penalty! let that come now, Which soon or late must come. For light like this Who would not dare to die?

Peace, my proud aim, And hush the wish that knows not what it asks. Await his will, who hath appointed this, With every other trial. Be that will Done now, as ever. For thy curious search. And unprepared solicitude to gaze On Him-the Unrevealed-learn hence, instead, To temper highest hope with humbleness. Pass thy novitiate in these outer courts, Till rent the veil, no longer separating The Holiest of all-as erst, disclosing A brighter dispensation; whose results Ineffable, interminable, tend E'en to the perfecting thyself-thy kind-Till meet for that sublime beatitude, By the firm promise of a voice from heaven Pledged to the pure in heart!

Power of Habit.-Mr Amos, in a lecture, lately delivered on medical jurisprudence, related the following singular fact:- 'I may mention a fact, which of course does not appear in the printed trial. Patch's Counsel, then Serjeant Best, pressed the prisoner, in conference before the trial, to say whether he was not left-handed,-but he protested he was not,-as the evidence proved that the murder was committed by means of a pistol-shot by a left handed man; but being called upon to plead, and put up his hand, he wer, none at all, and nobody does it now-a-days that answered 'Not guilty,' and raised his left hand.'-Legal Observer.

This instinct which the elephant possesses of trying the strength of any construction, whether natu. Land, situated in the town of Pinckney, county of Lev ral or artificial, which it is necessary for him to cross, is particularly worthy of observation. When the enormous weight of a full-grown elephant is considered, it must be obvious, that if the creature were rashly to place his body upon any frail support, his danger would be extreme. His caution, therefore, in avoiding such an evil is constantly exercised; and the powerful as well as delicate instrument of touch which he possesses, enables him always to be convinced of his security, without incurring any risk under ordinary circumstances. The elephant at the Adelphi retained this instruct in full force, however she might have been led away from her natural habits by the artificial restraints of her discipline; -and we, therefore, give full belief to the assertion. We are not quite so prepared to believe what we have also heard stated with regard to this animal, that, upon being satisfied of the strength of the stage, and finding herself in a theatre, she immediately, without ble trouble, and to the greatest advantage, the drove any direction from her keeper, began to rehearse the scenes which she had previously performed at Pliny, however, tells us, that an elephant, having been punished for his inaptitude in executing some feat which he was required to learn, was observed at night endeavoring to practise what he had vainly attempted in the day :-- and Plutarch confirms this, by mentioning an elephant who practised his theatrical attitudes, alone, by moonlight .- Library of Entertaining Krowledge.

One Swallow does not make a Summer .- One sharp frosty day the late King, when Prince of Wales went into the Thatched House Tavern, and ordered a beef-steak; but observing that it was excessively cold, desired the waiter to bring him first a glass of brandy and water. He emptied that in a twinkling, then a second, then a third. 'Now,' said the Prince, 'I am warm and comfortable:—bring my steak.' On this , Mr Sheridan, who was present, wrote the following impromptu:-

'The Prioce came in and said 'twas cold. Then put to his head the rummer: 'Till swallow after swallow came, When he pronounced it symmer.'

'Ferdinand the Seventh,' said a distinguished diplomatist, 'is decidedly Priest rid-but his people are absolutely governed by lunatics.' What else could be expected,' replied a friend, 'When the very capital itself is Mad-rid!

AN ODD MISTAKE.—On the 12th of the fifth moon, the Qwong-heep led five hundred soldiers to the villages outside the north gate, in order to seize certain banditti, who had plundered the house and violated the person of a lady, whose husband was absent on duty in Pekin. But, by some mischance or other, the Qwong-heep seized a few of the frightened farmers' men, and let the rascally banditti escape .-Canton Register.

A Frenchman, in his recently published 'Tour through England,' remarks that 'punch in all shapes is a great favorite with the English :- punch is his favorite liquor-Punch his favorite entertainment - and a punch on the head his favorite argument.'

Charcoal .- The common council of Troy have passed a law, prohibiting any person from vending and selling choreoal in that city, unless it be sold by measurement in wooden tubs or measures, to contain one or two bushels of charcoal, and to be approved and conspicuously marked by the sealer of measures. A violation of the law, involves a penalty of \$2 for each offence.

'To the question what advantage is there in making use of Greek and Latin sentences, when addressing those who cannot understand them? I ansknows any better. It was fashionable once, but it would be fantastic now.

Valuable and Cheap Land-for Sale.

The subscriber offers for sale, 14,000 acres of choice and state of New York. Some of the land is improvement under cultivation. The country is remarkably be tin, being entirely free from the fever and ague and fre h the common bilions fevers which often afflict the tow upon Lake Ontario, this town being 18 miles east of t lake. The soil is principally a sandy toam, much of covered with rich black mould. The timber is chief Sugar Maple, Black Ash, Butternut, Beech, Elm, & The land yields first rate crops of Grass, Rye, Oats, Ba ley. Potatoes and Flax; and on some lots, good Whe and Corn may be grown. To those wishing to obtain a perior grazing farms, a fine opportunity now offers itse The produce of pasturage and hay from an acre of the land, is very large, fully equalling if not surpassing the from the same quantity of land in any other of the Blad River townships. The land is admirably well watere there being but few lots which have not dutable runnit streams upon them. The land is well adapted to Orchar ing-the Apple tree thriving very well in this count Stock of all kinds may be disposed of with the least pospurchasing at the very doors of the farmers, and pavir the highest cash prices for their cattle, which will readi find purchasers at all scasons of the year. Several fa mers at present residing on this town, were original from the New England States, and some of them fro Massachusetts, who are in thriving circumstances. T above described land is offered for sale at the very lo price of from two dollars and a half to three dollars p acre, for the uncleared land, and from three dollars and half to five dollars and a half for the improved lots. The land will be sold in lots to suit purchasers, and from in to five years' credit for payment, in annual instalment will be given. As a further convenience to purchaser the subscriber will receive in payment, Cattle, Shee Perk, Grain or Grass Seed, for which products he wi allow the highest eash prices. The title to the land indisputable, and good Warranty Deeds will be given! purchasers. Persons desirous of purchasing will pleas to apply to the subscriber, at Henderson Harbor, count of Jefferson, State of New York, or to DAVID CANFIEL Eso, on the town. JAMES H. HENDERSON. ep16t March 9.

Ammurition 3 Of the best quality and towest prices, for sporting-constantly for sale at COPELAND'S POWDER STORI 65 Broad Street.

N. B. If the quality is not found satisfactory, it me be returned, and the money will be refunded. If Jan.

Hickory.

This astonishing fleet horse was raised in Montreal, from an English blood mare, (sire unknown,) is not in ferior to any in the U. States for speed, action and bear ty. He is a fine sorrel, well built, good size, and pre nounced by (good) judges in every respect a first rat horse; trots a 3 minute gait, fast walker, and has pace around the trotting course, Long Island, in 2 minutes, 3 seconds, and was offered publicly to match against an horse that could be produced. It is considered unnecessary to say more, as his qualifications are too well know to be doubted.

He will stand at Abbott's Inn, Holden, during the season. Terms \$8, the season. 6t

Published every Wednesday Evening, at \$3 per annum payable at the end of the year-but those who pay within sixty days from the time of subscribing, are entitled to a de

duction of fifty cents.

No paper will be sent to a distance without paymen being made in advance.

BEES.

MR FESSENDEN-If the inexhaustible subject Bees is not worn out in your columns, you y state as follows.

a January last, with two friends, I called at entleman's house, in Worcester, Otsego county. V. to see his Beehives .- He showed us a se 4 by 6 feet, and 6 feet to the caves, boarded, boarded, shingled and well floored, with a close r; on unlocking and opening which, we be-I an ordinary bechive attached to the east wall well braced, with slight scaffoldings extendupon the east, south and north sides. The aperitire was a small hole or two on the east under the hive, which was elevated about e feet from the floor, for the bees to pass, our in. The bees had been put in, a young swarm, nonths before. The original hive was not filled, but large masses of comb were attached e exterior, and along the contiguous scaffold-The quantity of honey was probably from to 150 lbs. On my return I called to see ier Bee house belonging to the same gentleon another farm, built the preceding sum-

This was 6 feet square, better finished and ed. The bees had filled the ordinary hive, constructed eight or ten large pieces of comb e exterior, and these last were mostly filled honey, and of the finest appearance, I think, ever saw. The gentleman t ld me he could himself to honey whenever he pleased, ut disturbing the bees. I asked him if the noth did not plague him; he answered no. dopted the simple precaution of sprinkling of turpentine occasionally, say every two about his ordinary hives, and around the of entrance into his large ones, which wholly d the moth. I was so much pleased with an of managing bees, that immediately on turn I had a house constructed for them. esign to put into it the first swarm which I J. BUEL. Respectfully, ve.

From the New York Farmer.

TENING HOGS WITH BOILED FOOD. remarks of Mr Buel, on the advantages of g feed for fattening Hogs, in the No. of your I for Dec. 1830, certainly merits more at in than the subject will be likely to receive. g since as in ISO3 or '4, I had practical exse of this benefit in fattening what was there a very mammoth of a log, the net weight of a bout six hundred and fifty pounds.

r having slain my stock of pork for a farm, December, on riding by a neighbor's, three miles from home, in the eastern part of Co-County, I discovered a very large framed pering around the fields, his hair sleek, and led he had just escaped from the sty. On

As my effort to persuade him was ineffectual, he altogether unsuccessful.

the hog, for less than what the owner called the value of the corn he had caten, put him into a warm stye, partitioned from a horse stable, and the next day commenced feeding him with hasty pudding, as my neighbor called it, made of corn meal and a mixture of boiled potatoes, with now and then some pumpkins. This was done in a large kettle set in an arch, one boiling of which would last him a week. The hog soon began to fatten very fast, and to satisfy my neighbor who often called to He fattened astonishingly. On the last of the next June, having kept him very cool over night and without food for eighteen hours, I had him slaughtered before sunrise; and after banging a little time, the meat cooled by throwing on cold water, ent up and thrown into pickle with the hams and

. Albany by a careful men, just as it was laid corked. down in a half hogsbead. He sold the meat readily, and brought me back on the evening of the 4th of July, 640 odd York shillings for so many poundof meat from this hog, sold out of the pickle. This enabled me to close my account current, the result of which was a clear profit of about one third of the sum he produced me. These facts were all perfectly notorious at the time -for at that time this was a monster of a 'porker,' as they say in Kentucky; and I think was published in some newspaper; but I do not know that any one except myself, has persevered in this plan of feeding, or that the experiment had any permanent effect on others. The farmers here have considered the perfection of pork making to consist in plenty of good sound yellow corn, and clear cold water, and so they will for aught that I can discover, judging by past experience. Yet you may, if you please, publish this, for possibly some one may not be too wise to take a hint, if hint this long story may be called. For thirty years I have fattened all my pork on cooked food, and am confident that it has been Jone with one half of the quantity of corn that would have been required ted raw, on the cob. It is more than ten years since these facts were all communicated to Mr Buel the writer of the Albany County Agricultural Report, by A SCIENTIFIC FARMER.

ON CHEESE MAKING.

notice, the owner told me the story of this operations in cheese making, and the flavor of this, is the careful preparation of the rennet, to which was that this had been the second at- the cheese depends very much upon the manner have an article of the same strength and flavor and o fatten him, and that the bog 'would only in which it is prepared. For this purpose, the through the whole season; and this can only be and not fatten,' for which reason he had stomach or maw of some ruminating animal, is done by having it all prepared together, before the eled to give him another wintering, and had made use of, and that of a young calf is preferred season commences. This is so important a part

just turned him out of the sty, having done so the by the best dairy women. Various opinions have fall before. On going to examine his other hogs, prevailed at different times with regard to the use I found they had been supplied with plenty of of rennet. The Jews made use of the juice of good sound corn in the ears, and cold water from plants for coagulating milk for cheese making, as a running brook. I tried to persuade the owner the use of rennet was strictly forbidden by the to adopt my plan with this hog, and feed hom on Mosaic law. The Dutch cheese of commerce is corn meal boiled, but he soon stuck up his nose at made by congulating the milk with muriatic acid. the idea of making 'hasty pudding for his hogs!' which combining with anomal alkali, contained in the milk, forms muriate of assimonia, and it is owing finally made me an offer of his hog, to try the plan to the presence of this salt, that Dutch cheese has myself, confident, as he said, that I would find it such a sharp purgent taste, like the sal. ammoniac of the shops. When the stomach of a young ealf To make the story as short as possible, I bought has been taken out, which is intended to be used as rennet, the contents should be emptied out, and the bag washed very clean, and laid down into a stone jar, or some other convenient vessel, and covered with a strong brine.

It is the custom of some to save the coagulated milk or card, contained in the stomach, when the calf was killed; but it is found extremely difficult to keep it sweet, and therefore it is now neglected at most dairies. When the maw has been about four days in the brine, it should be taken out and see him. I kept an exact account current of his feed. drained, and put into a new brine, sufficient in quantity to cover the maw; in which, there should be put, at the rate of one lemon, and one ounce of cloves, to four maws. After the reunet is thus prepared, it should be kept closely covered so as to exclude the air as much as possible; a stone jug of sufficient size is well calculated for shoulders. On the 3d of July, I sent the meat containing it during summer, which may be closely

Rennet which has been kept in this manner one year, is found to be better than such as has been newly prepared.

In whatever way the rennet is prepared, it should be done before the season for cheese making commences, in sufficient quantity for the season. It should all be prepared in one vessel, that the whole quantity may be assimilated in strength as well as flavor. One very great defect in most of our small dairies, is a want of uniformity in the quality of the cheese, and with large ones that we have never adopted any particular standard for quality, which should be known in market by a particular name.

In England, cheese making is reduced to a system, and the kind of cheese to be made being decided upon, the particular process for that kind is pursued; and the cheeses are produced with as much uniformity, as our bakers make their bread from the same flour ; and thus cheeses are known from one end of the kindom to the other, by name: and a person wishing to purchase of any given variety, can send for it with as little danger of being deceived, as there would be, if he sent to the bakers for a loaf of brown bread or a loaf of

Now this uniformity of quality, which should be known by name, in our market, is what is wanted to make our cheese compare with any in the world, as no country produces finer or richer The preparation of rennet is one of the first pasturage for cows. The first great step towards unskilful bands.

It is a very common practice for dairy women to send to the butchers and purchase dried maws. This is risking the produce of the dairy, as it is to be apprehended from overcharging the land er a much better profit from his labor than a next to impossible to tell, after the maw has been with seed. The land will force up as much as it dried, whether it was carefully done; and if not, is able to bear, and the balance will remain under maws in preparation for the season, they should be and improves the quality. purchased of the butcher, when first taken out, and prepared under your own direction. Chinese Corn.-A new species of corn from China has been introduced into Ireland, a sort of skinless oats, the most valuable produced in any country. It has many advantages over other grain when threshed from the sheaf, it is exactly like oatmeal, fit for immediate use, and free from any particle of rind or husk.

The flavor is delicious, and it contains much farinaceous matter. There acrues, of course, a great saving of the oats; and expense of kiln drying, grinding, and sifting, is avoided. The average produce is twentysix barrels of 14 stone, to the Irish acre. It is remarkably hardy, and well

Daniel Brown, Esq. of Portsmouth, N. II. has recently put in operation a manufactory of potato starch which has already used 15,000 bushels of potatoes and it is thought will use 40,000 bushels before I832.

We believe there are two manufactories of starch Hamp. Sentinel.

Such and so well established is the confidence to be filled up to make rail-roads in their place !the power of steam has effected worderful changes arthed at Waterloo, in 1819, for the sake of that a locomotive engine will travel on a level railrate of twenty miles an hour, and draw one hunthe teeth once employed in biting cartridges dred and fifty tons.-What further improvements are to be made we cannot say, but enough is done to prove the economy as well as expedition of the fillions of bushels of the bones of these poor mode of transportation. ON THE USE OF CHLORIDE OF LIME,

AS A PREVENTIVE AGAIN T COUNTRY FEVER. DEAR Sta-The period has arrived for the performance of a promise that I made you in September, that if I escaped the country fever until the middle of November, that I would make you a communication on the use of the chloride of lime, as contributing to the preservation of health, when exposed to the mephine air of the country during the summer. Before I enter on the explanation it is necessary to premise, that I visited my plantation (under the culture of rice) throughout the summer, for twenty years past, generally remaining two and often three nights-that for twelve successive years (with the exception of the two last.) I invariably contracted the country fever, and was several times dangerously ill, and many weeks confined to my chamber. My annual exposure to the deleterious air of a rice plantation, with a regular recurrence of fever had made it almost a habit in my system; but I nevertheless continued to incur the risk of visiting my plantation. In the month of June, 1829, having reflected much on the established purifying quality of the chloride of line on animal and vegetable putrefaction I determined to test its efficacy on the miasmata of the country supposing that the air of my chamber might possibly be corrected by it, and rendered more salubrious. Under this impression, I procured a small jug of the chloride, and took it to my plantation about the middle of July, in the summer of 1829, when I commenced my experiment with it by putting two table spoonfuls into two saucers, (two in each) one saturated with water to a state of paste and the other was kept dry; they remained on my mantle-piece until 1 retired to bed, when they were removed to my chamber and placed on each side of my bedstead, (on the floor) at the distance of three or four feet. I never repleaished the saucers until I revisited the country, which was generally in the course of eighteen or twenty days throughout the summer. I experienced no fever, after June, in 1829, and I can confidently say that my visits to the country in the summer of this year, have been more frequent and of longer duration than heretofore, and with perfect impunity. I have regularly used the chloride on each visit, with the alteration of placing the saucers on the hearth, in preference to the bedside. Whether my exemption from fever in the two last years, may be ascribed to the chemical properties of the chloride, or not, I am incompetent to decide; but I am disposed to think that it affords some protection in our dormitory during the hours of sleep. Planters will recollect that the summer of 1829. was as remarkably wet as this has been dry. As an auxiliary to the chloride, I recommend the avoidance of night air whilst in the country, and an early breakfast before exposure to the morning air. Having acquitted myself of my promise,

I remain, very respectfully, Dear sir, your ob't serv't

HEGH ROSE. Charleston, November 16, 1830.

REMARKS ON THE CURCULIO.

I have been endeavoring to collect some materials for a paper on this formidable insect, but these are far from being completed. It may be more useful to mention the little that I do know, however, in this stage of the inquiry, as it may stimulate others, than to wait till I could speak with more confidence.

by W. Wilson, as perforating a peach stone, is the same as those which prove so destructive to our smooth skin stone fruit.

Soon after the blossoms are fallen from the plum trees we found our insect in considerable numbers among the branches; and on jarring the tree, they commonly drop, pretending to be dead. Several of my friends assure me that they watched the movements of the female ; that her manner of depositing the egg in the young fruit is similar to that of the Curculio nucum of Europe ; and that while engaged in this business she is not easily shaken from the tree. They have also removed the nit and then the fruit healed with a scar. These worms when found in fruit nearly ripe, are much larger than those described by W. Wilson. On conferring with several persons who have examined our insect in its winged state (for I-have no specimen) we think its length is one fourth of an inch. The color is dark brown.

The worms found in pears, plums, and apples were considered as the same species by Dr Turas

It is said that the worm escapes from the fallen fruit to the ground, and there remains during the

The fruit of an old near orchard in a pasture near Philidelphia, had been much infested by worms. At last the proprietor had it ploughed late in Automa or in Winter, and scarcely a worm was seen the succeeding year. This effect was ascribed to the Ploughing which turned the larvæ up to the frost.

As an entomologist, I am solicitous that this insect should be figured and described, and its manners well understood ; but as a cultivator of fruit, I have no anxiety on the subject. I want no premium to be proposed for its destruction, because I consider the problem to be already solved. One of my friends has had plentiful crops of plums for eighteen years in succession by keeping hogs in his fruit garden; yet trees within fifteen rods of that garden, have annually lost all their fruit by the

SALSIFY, OR VEGETABLE OYSTER. Tragopogon porrifolium, L.

This plant is a hardy biennial, which has, within a few years past, become a favorite with our gardeners.

It is cultivated for the roots, which are about the size of small carrots, of a dingy white color with a milky juice. When cooked, they have a flavor not unlike oysters, from which circumstance is derived their common name. To cultivate this plant the seeds should be sown in the fore part of May, in beds of deep rich earth, prepared the same as for parsnips-their general culture and time of use being the same, and also their mode of preservation .- To save seeds, a few plants should be put in the ground in the spring, when they will shoot up about four feet high. The flowers are of a dull purple color, which are followed by seeds about an inch long, attached to a feather, like the seeds of the dandelion. The young stalks and leaves of this plant are sometimes boiled, and make an excellent dish.

We think this plant will be more generally cultivated, as gardeners become more acquainted sion to the smell of tar.

The 3d volume of Say's Entomology, I have with it, as it is the best substitute for oysters that not examined, and know not its contents; but has yet been discovered, and may be cooked in a) I suspect that our Curculio is exclusively American the different ways in which they are, and in some and that we shall not find it in any European work. dishes, it would be very difficult to distinguish I have doubts also whether the insect described the two. Having cultivated them for a number o years, we most carnestly recommend them to ou western farmers and gardeners, as a vegetable de serving a place in every garden, as they are o easy culture, not liable to be destroyed by insect and as giving a variety to the table through the fal winter and spring months .- Genesee Farmer.

> The Soil best suited for Longevity in Peaches is 1 light sandy bottom, for instance, the wood is never so strong as in strong loam, and not so apt to be intested with the worm in the roots : in such soi as this, well cultivated every year, they will maintain their vigor for many years.

> What I mean by well cultivated is, the ground kept continually removed by cropping it with such crops as will tend to improve its texture ; such a potatoes, turnips, peas, beans, &c, and every four or five years a crop of buckwheat, to be ploughed in, when in bloom ; this will be found to be grea service to both land and trees; as for corn, clover timothy, orehard grass, and such like, they ough never to be suffered to be cultivated in an orchard

> It is much better to have 100 trees of good kinds such as you want them for, well cultivated, that 500 or even 1000 neglected to take their chance as is often the case when ground is cheap.

> Great care is required in preparing the ground for an orchard .- American Farmer.

> Composition for preserving Farmer's Utensils .-With three fourths of a pound of rosin in an irot kettle, melt three gallons of train oil, and three or four rolls of brimstone; when they are melted auc become thin, add as much Spanish brown or any other color you choose, ground up with oil in the usual way, as will give the color you desire. Ther lay on a thin coat with a brush, and when dry lay on another. This will preserve harrows, ploughs carts, wagons, vokes, gate posts, weather boards shingles, &c.&c, many years from the effects of the weather. It will also prevent the rain from injuring brick walls.

> Slips .- Ladies who are fond of green house plants, and have it in their power to procure slips of various kinds, will find a great benefit, and a most certain preventive of failure, particularly either in a warm room in winter, or a warm sun in summer, by covering their slips with bell glasses, or where they cannot be procured, with tumblers, or any kind of glasses that will admit light observing to admit air, at least one hour each day, and not keep the slips too wet, as it has a tendenev to rot them before they strike root, or have leaves to carry on evaporation. By this process, hardly any single instance of a plant has been known to fail. In setting slips, it is important to clip nearly all the leaves, else there is too great a call for sap ere it has rooted. An ounce of saltpetre, or a spoonful of chloride of lime, in a gallon of water, is a great quickener of vegetation, and at once shows its beneficial effects .- Genesee

> Tar on Sheep .- It is but little known, but it is nevertheless a fact, says the Portland Mirror, that a little tar rubbed on the necks of young lambs or geese, will prevent the depredations of foxes upon them, these animals having an unconquerable aver

POLITENESS IN CHILDREN.

In politeness, as in many other things connected ith the formation of character, people in general egin outside, when they should begin inside; intead of beginning with the heart, and trusting that form the manners, they begin with the manners. nd trust the heart to chance influences. The goldrule contains the very life and soul of politeness. hildren may be taught to make a graceful courtesy, a gentlemanly bow, -but, unless they have likeise been taught to abhor what is selfish, and always efer another's comfort and pleasure to their own, eir politeness will be entirely artificial, and used lly when it is their interest to use it. On the other nd, a truly benevolent, kind-hearted person will ways be distinguished for what is called 'native liteness,' though entirely ignorant of the convennal forms of society.

I by no means think graceful manners of small portance. They are the outward form of refineent in the mind, and good affections in the heart; d as such must be lovely. But when the form exs without the vital principle within, it is as cold I lifeless as flowers carved in marble.

Politeness, either of feeling or of manner, can nebe taught by set maxims. Every-day influence, unconsciously exerted, is all important in forming characters of children; and in nothing more im tant than in their manners. If you are habitually ite, your children will become so, by the mere ee of inutation, without any specific directions on Your manners at home should always subject. such as you wish your family to have in compa-

Politeness will then be natural to them; they possess it without thinking about it. But when ain outward observances are urged in words, as is ortant only because they make us pleasing, they ime an undue importance, and the unworthiness he motive fosters selfishness. Besides, if our manners are not habitually consistent with the is we give, they will be of hitle avail; they will ill probability be misunderstood, and will certaine forgotten. I, at this moment, recollect an anote, which plainly shows that politeness cannot huffled on at a moment's warming, like a gart long out of use. A worthy, but somewhat vulwoman, residing in a secluded village, expected it from strangers of some distinction. On the of the occasion, she called her children togethnd said, 'After I have dressed you up, you must ery still, till the company comes; and then you be sure to get up and make your bows and tesies; and you must mind and say "Yes, im," and "No, ma'am"—"Yes, sir," and "No, to thank you." The visiters arrived—and the ren, seated together like 'four and twenty litogs all of a row,' uprose at once, bobbed their and courtesies, and jabbered over, 'Yes, ma'am na'am, Yes, sir, No, sir, I thank you, There,-

POLITENESS TO THE AGED.

er, now we 've done it!'

thing tends to foster the genuine politeness, a springs from good feeling, so much as scruss attention to the aged. There is something mely delightful and salutary in the free and 7 intercourse of the old and young. The freshand enthosiasm of youth cheers the dreariness e; and age can return the benefit a hundred y its mild maxims of experience and wisdom. s country youth and age are too much separathe young flock together, and leave the old to selves. We seem to act upon the principle here cannot be sympathy between these two mes of life; whereas there may be in fact, a charming sympathy—a sympathy more producf mutual benefit than any other in the world.

aged, from the loneliness of their situation, ant of active employment, and an enfeebled of health, are apt to look upon the world with my eye; and sometimes their gloom is not unharshness and asperity toward the follies of the information .- N. Y. Gazette.

voune. These evils, so naturally growing out of their issolated situation, would seldom gain power over the old, if they were accustomed to gentleness, attention, and deference from the young; they would be softened by juvenile love, and cheered by juvenile gayety. Such intercourse sheds a quiet brightness on the decline of life, like sunshine on a weatherheaten tree, or a moss-covered dwelling. What is there on earth more beautiful than an aged person full of content and benevolence?

An Invention.-The Banner of the Constitution describes a machine moved by a steam engine for planing, grooving and tonguing boards. X rough pine board is placed on a platform, or carpenter's bench, and drawn under a cylinder, to which are affixed a number of knives, which, revolving with the cylinder with the rapidity of a spindle in a cotton factory, chip off from the upper surface of the board small pieces of shavings as it passes along, whilst at the same time a groove is formed on one edge of the board and a tongue on the other, by the application of other stationary tools. In about forty seconds a rough board is fitted to be laid down in a floor, baving this advantage over one planed by hand, that it is a thickness, uniform even to mathematical exactness with all the others, so that, not only is it better calculated to make a solid floor, from its evenness, but the tongues and grooves all fit with perfect precision. In this manner board follows board in rapid succession, without any stopping of the machinery, and when each reaches the end of its journey it is pushed by the machine out of a window, where it gently slides down an inclined plane into the yard, from which it is hauled away to its final destination. The most which this machine has yet accomplished is five hundred boards in a day, fourteen feet long, and from one to twelve inches wide. It requires two men, or one man and one boy to attend it. A good day's work of a man with the hand plane, is twenty boards per day.

Discovery .- It is found that every loaf of bread in the process of baking gives out about two ounces of spirit in the form of vapor. A method has been contrived of constructing ovens in such a manner as to save this spirit.

It is a coincidence worthy of note that at the same time that a discovery was announced, which is calculated to increase so prodigiously the quantity of distilled spirit, Mr John Sullivan, civil Engineer has found that spirit is the readiest, surest and cheapest means of igniting anthracite coal. In steamboats, factories and even in private houses this may be very important.

A SEA EAGLE .- About a month ago the gamekeeper at Davenham Hall, Cheshire, the seat of J. H. Harper, Esq. observed a remarkably large bird seated on one of the highest trees in the park. He fired at it, and the bird was mortally wounded. On approaching it, he found that it was a sea eagle of extraordinary size, as well as beautiful in form and plumage. From the tin of one wing to that of the other, when extended, it measured nearly nine feet. This great curiosity has been presented to the Natural History Society, Manchester, and now enriches the museum, it being the finest specimen of the sea eagle which the Society possesses.

A few days since a Catholic clergyman residing in this city, called at the residence of a gentlemen, and inquired of the servant if he was at home. On being answered in the negative, he asked for the lady of the house, and on her presenting herself, he observed-' Madam, are you the lawful wife of Mr -?' She replied affirmatively, when he handed to her a small sum of money which he said, he was instructed to pay to her husband, or his legal representatives-being the amount of which he had been defrauded by a person in his employ. with bitterness: hence arises the complaint of clergyman then retired without giving any further RAILWAYS, &c.

The number of engines now on the line of the Liverpool railway, all of which are made by George Stephenson, Esq. the celebrated engineer under whose superintendence the road was constructed is 19, and it is expected that several others will be placed upon it in a few weeks. With respect to the conveyance of goods, the railway most fully answers the expectation of the directors .-More goods are conveyed by the company than by all the carrying firms who ply between Manchester and Liverpool. The journeys with goods are invariably performed in an hour and a half, in order that they may not obstruct the carriages with passengers. The extraordinary speed with which they must necessarily move, to accomplish the distance within the prescribed time, fills the mind of spectators with astonishment; and notwithstanding the frequency of the journeys made by these machines, the craving of the public seems still undiminished. The facilities afforded to commerce by the railway, are strikingly apparent from the fact that the entire cargo of an American vessel, from Charleston, S. C., laden with cotton, arrived at Manchester within a hundred minutes after being discharged.

Important Invention for Manufacturers .- Napolcon offered a premium of three millions of france to the person who should discover some material the production of France, that should in all respects answer as a substitute for indigo. In consequence of this stimulus, M. Souchou, a practical chemist and dyer, expended a fortune in experiments which finally resulted in the discovery of a method for fixing the color of prussiate of iron, even more permanently than indigo blue. With this preparation he has succeeded in dving green, blue black, and black, at an expense of little more than one third of that of indigo colors, and said to be in every respect equally fine and perma-

We learn that Mr Arnold Buffon of this state, during his residence at Paris, effected a contract with M. Souchon, for the communication of the process to him, to be introduced into the United States; and that he has recently received a full explanation of the method by which this important desideratum is effected.

The colors are said to resist the action of both acids and alkalis, and when worn for years (as we have seen stated by a mercantile house of high standing in Paris,) will present no whitened appearance on the seams, or at the pocket and button holes of garments, the colors there remaining unchanged - Providence American.

Fecundity of Fish .- Eight or ten years since, half a dozen small pickerels were put into the Cubbosseconte, none of whose tributaries before contained any, and now all the ponds and streams connected with it swim with these fish. Within the last year thousands have been taken and yet they appear to be on the increase. Yesterday we saw 40 or 50 very fine ones-one of which weighed 5 pounds—all taken by one individual in 2 or 3 hours -Gardiner, Me. paper.

Charcoal for Hams .- A writer in the American Farmer recommends to pack Hams, after they have been smoked, in pounded charcoal. It keeps out the flies, and prevents the fetid smell and unpleasant taste too often found in hams exposed for sale.

NEW BUGLAND FARMER.

BOSTON, WEDNESDAY EVENING, MAY 25, 1831.

Messrs Buel and Wilson, Nurserymen, of Albany, who are indefatigable in their exertions to introduce the new horticultural productions of Europe, have just received the following valuable acquisitions which will be propagated with all practicable despatch.

100 varieties of pears, mostly new, duplicate plants, from M. Noisette.

15 new green house and 15 hardy tree roses duplicate plants, from do.

27 New Roses from Loddiges of London.

do from Charlwood. 50 do

18 Pears, 12 apples, 3 plums and 5 cherries (scions) from the London Horticultural Society's garden.

27 Pears and 15 apple (trees) from B. Saunders, island of Jersey.

13 Pears and 28 apples from M. Saul, Lancashire, Rev. Mr Bree, Coventry, Youngs, Epsoin and Ronald's, at Brentford.

40 extra fine Dahlias, selected by an amateur, and cost in London \$1 each.

VALUE OF AGRICULTURAL INFORMATION. Extract of a letter from a subscriber in Maine.

'Twenty years since I planted out several peach trees, all of which died soon after, for want of knowledge how to treat them. I was then informed by our knowing ones, that the peach would not grow in this place. I believed them, and made no farther effort to propagate them, until three years since, I produced from Wm, Kenrick's valuable nursery half a dozen trees, five of which, I now have in a healthy, flourishing state, very full of blossoms, and with a prospect of much fruit from them. For this I am indebted to the information obtained from the New England Farmer. There are some persons here who know not what kind of tree it is that appears so beautiful, and others when passing have even called in to inquire what they were,

SCIENTIFIC AGRICULTURE.

The following letter was written by the proprictor of 'Orange Farm,' to the editor of the American Farmer. This farm is situated about two miles from Baltimore, and is under the care of Mr Underwood, formerly of Roxbury. It is certainly a very encouraging example,

Mr Smith-Under an impression that the agriculturists of our country with a few exceptions, did not employ capital enough in their business, 1, about twelve years since, determined to carry my ideas into effect upon my Orange Farm, consisting of 400 acres. After the desired fertility had been given to the soil, 80 acres of it were converted into a garden, and 270 acres into a dairy farm. Of these 270 acres, about 70 are in wood, and about 200 under cultiva-

The cows are in number about 100-sometimes more, and sometimes less. They are kept in warm, but well ventilated stables throughout the winter, and part of the spring and autumn. fruit. They are not exposed to cold rains even in summer. They run during the summer on luxuriant pastures, each of which afford a comfortable

where they get their drink. As there is no run- orientalis; some of them are well grown although ning water on the farm, we have to depend on only three years planted. pumps. And it may not be out of place here to In the Nurseries we saw a great many Magstate, two dogs, one at a time, pump all the water, notices, of which they possess no less than thirteen and cut all the corn stalks, straw and hay used distinct species, and three varieties; one plant of for all the cows and other animals of the farm, the Grandiffora is 20 feet high, and in full bloom. These cut articles, mixed with commeal, bran, Here are likewise the Cordata 50 feet high; shorts and roots, are cooked by means of a very a beautiful Eliptica, in flower; and a magnificent simple steam apparatus for their food during the specimen, IS feet high, of the Conspicua; the winter with occasional variations.

Extract from the Report of the Visuing Committee of the Penn-sylvania Horticultural Society, made July, 1830. 'NURSERIES AND GARDENS OF D, AND C. LANDRETH.

'These extensive grounds stand on Federal street, near the Arsenal; they were first cultivated fortyone years ago, and have been well kept un ever since.

The earliest collection of Camellias was made here; some of those now in possession of these distinguished nurserymen, are 10 feet high; they have twentyfive sorts, two of them seedlings, in high estimation.

The selection of GREEN HOUSE Plants is valuable, and extensive-consisting, among many others, of Rhododendron arborea, 74 feet high, bearing rich crimson flowers. The Erythrina cristagalli, conspicuous in the Papilionaceous tribe, and bearing for the second time this season a profusion of flowers; the Strelitzia regina, with its curiously formed and elegantly contrasted flowers; the Corrwa speciosa, &c. Different species of the genus Citrus, consisting of the Orange, Lemon, Citron, Shaddock, &c. are in good order and covered with

The GREEN HOUSES are 132 feet, to which are added a room 40 by 20 feet, and extensive glass framing for keeping plants. Adjoining to the shade. So much importance is attached to shade, mansion-house are some handsome evergreen that sheds have been erected over the troughs, hedges of the Arborvita, Thuya occidentalis, and stroys them.

deurious Osage Orange, that retains its lucid foliage The cows are at all times in the stables clean, longer than any other diciduous tree; a very large bush, 8 fect high, of the Clethra acuminata the Of the sales of the products of this dairy Indromedu arborea; varieties of red, yellow, and farm, there has been for a series of years a white dealer fine; Hydrangeas planted in the progressive increase. The account of the sales open ground many years back, some of which are of last year, as rendered to me by my manager 4 feet high, and 22 feet in circumference with on the 1st Jan. last, you have below; and I am about two hundred flowers, one flower measured given to understand that it will be more this 12 inches diameter; it is thus proved that with a year. In this statement the proceeds of the gar-little protection this shrub will stand our winters in the open ground; a large bash of the Puri As the expenses of repairs, of buildings, and Japonica, more than 30 feet round, stands the win-

> The Nurseries are very correctly managed, and cover 40 acres, supplying every part of the Union, a detail of which would occupy too much of our space. We therefore content ourselves with stating that the stock is very large, and in every stage of growth, consisting of Forest and Ornamental Trees, Shrubs, Evergreens, Vines and Creepers, with a collection of Herbaceous Plants, Fruit Trees of the best kinds, and most healthy condition; large beds of Scedling Apples, Pears, Plums, &c., for budding and grafting upon, a plan very superior to that of working upon suckers, which carry with them into the graft all the diseases of the parent stock. In these grounds are to be seen in the spring the most beautiful Hyacinths in the country, consisting of fifty different sorts of the double

GARDEN SEEDS of the finest quality have been scattered over the country from these grounds, and may always be depended upon. The seed establishment of these Horticulturists is the most extensive in the Union, and the reputation is well sustained from year to year. To obviate the chance of mixture of the farina of plants of the same family, they have established another nursery at a suitable distance, so that degeneration cannot take place, and which secures to purchasers a genuine article; the age, quality, and process of culture of every plant being thus known to the proprietors, the supply from their grounds is recommended with great confidence. When properly assorted and labelled, the seeds are sold at their Warehouse, No 85 Chesnut street, where may be had likewise all kinds of Garden Tools, and publications on Botany, Horticulture, Landscape, and Decorative Gardening.

HINTS TO FARMERS.

Baron Humboldt says, that timber should be left standing on the tops and sides of hills, for three very good reasons:

Ist, Affording a shelter during high winds. 2d. Affording better fuel than timber from low

2d. Preserving the subterranean water courses which pursue the uneven tenor of their way up the steep woodlands; but when the sun is let in, the parched earth drinks up, retards, and finally de-

Sheep - Sheep.

Valuable Books on the best method of forming good flocks, of increasing them, and treating them properly when in health and when diseased -en the character and value of Blerino Sheep-anatomic I structure, &c. &e-5 valuable works, viz :

Sir George Siewart Makenzie, Bart. Robert R Livingston, LL. D.

Samuel Bard, M. D.

M. Daubenton, a man of letters, and profound Naturalist; his work was published in Germany, Italy, Spain, and America-and in France, at the expense of the na-

Mr Tessin, inspector of the Rambouillet Establish-

ment-and others in France.

Also for sale-a valuable collection of Books on Agriculture, Manures, various treatises on Horses, Cattle, Botany, &c, &c. By R. P. & C. WILLLAMS, whole-Botany, &c, &c. By R. P & C WILLIAMS, whole-sale and retail Booksellers and Stationers, No. 18 and 20 Cornhill, Boston.

Library of Entertaining Knowledge,

Under the drection of the Society for the Diffusion of Useful Knowledge.

Now publishing by LILLY & WAIT, (late Wells &

Lilly,) rear of Boylston market, and by CARTER, HEN-DEE & BABCOCK, Washington street, Boston.

The parts of this interesting work which treat upon Timber Trees, and on Fruits, give much useful and cuious information on these subjects,-and are valuable to he farmer not only for the facts, that are collected with great research and judgment, but for the interesting nanner in which they are combined and parrated-leadng the old and the young to regard their daily occupaion, not alone as a laborious means of gaining a liveligood, but as an amusement, and a science.

The parts upon Insect Architecture and Transformation vill prove unusually interesting .- Interesting to all ; but o the Agriculturist particularly useful, in enabling him o understand the origin and the character of such ineets as may be made subservient to the uses of man, as rell as of that numerous tribe that often blight the exected harvest, and nip his promised fruits in the green

ee and in the bud.

There is scarcely a subject already treated upon, or nat has been announced in this beautiful series, that is ot calculated to prove interesting to the farmer. ne farmer alone, but the mechanic, and the scholar, will not it in the highest degree useful and interesting. It is treasure to the man of science, without proving a

umbling-block to the unlearned.

Each part contains more than 200 pages, and numeous engravings on wood, beautifully executed.-Price orty cents a part, and continued on the same terms. Societies for the diffusion of useful knowledge, schools ad seminaries, supplied on the most favorable terms.

IF Twelve numbers of the American edition are now ablished, and several others which are equally beautiil and interesting, now in press, and will appear in seedy succession.

The public are respectfully informed that sundry perns, lost to a sense of honor and regardless of the lives the community, have offered and do continue to offer r sale an article purporting to be 'Dr Moore's Essence Life,' but which does not even approach an imitation -the bills of Directions have the same caption-enumerion of diseases and certificates as former bills enclosing e genuine article, but the list of agents is not the same. he individual against whom I would most particularly rard the public, is Benjamin F. Simpson, of Chester, N.

. This man has sold to sundry persons in the city of. oston the spurious article—to some individuals he has ven his own name, to others he has called his name oore-to one person he sold a parcel of his article, and fixed the signature of Ebenezer G. Moore-to his bill sale to another person he represented himself as my other, and claimed an equal right with myself to manacture and vend 'Moore's Essence of Life.' 1 should it have noticed Mr Simpson if certain deale s in Medine were not in the habit of receiving from him and dming upon country traders the spurious article-wheer their object is gain, or a wish to injure the reputation

the genuine Moore's Essence, and thereby introduce ticles of their own composition, I know not—this much do know, the reputation of 'Dr Moore's Essence of ife' is too firmly established to he overthrown by the accentrated efforts of spurious dealers. I have long lown of the circulation of the pretended imitation, and we suffered it to pass unnoticed, but the duty I owe the JOHN S. MOORE.

Grape Vines.

For sale, at the Seed Store, connected with the New being the two leading hardy standard sorts cultivated, of extra size and thrifty growth, packed in moss, pace 50 cts. each. A further supply of the Alexander. Winne, Scuppernong, York Madeira, true Red Bland's and Orwigsburg, (all hardy sorts) are just received, at the same price.

Also, a good collection of the finest Double Mexican Dahlia roots, of the most showy and esteemed sorts, from 25 cts. to \$1 cach-Also, Jacobean Lilies, Tube Roses, and Tiger Flowers-price 25 ets. each. All the above are now in fine order for transplanting.

BUBLEY.

50 bushels two towed Barley, plump and clean for seed, raised by E. H. Derby, Esq. Salem.

April 13.

Wm. F. Otis & Co.

No. 110, Fancuil Hall Market, have a good supply of Carnation Pink roots, Pine Apples, and fine West India Squashes, from Trinidad de Cuba. May 18. May 18.

Potatoes for Seed.

For sale at the New England Seed Store, No. 52 North Market Street-

A few bushels of the fine seedling potatoes mentioned by the editor of the New England Farmer, vol. viii, p. 102. This is but the fifth year from the ball; they have twice taken the premium from the Essex Agricultural Society. (See Colonel Pickering's Report, N. E. Farmer, vol. vi. page 98) They are represented by the person who raised them, as tolerably early, more than middling bearers, remarkably delicate and mealy, size nearly round, color white, and have but very few protubecances. A good opportunity now offers to farmers to secure a superior variety of this important vegetable for seed. Price \$1 per bushel May 18.

Branding Irons, at reduced prices.

Carter's improved Branding Irons, for branding Guide Boards, for sale at the Agricultural Warehouse, Nos. 51 and 52 North Market street. This is a very convenient article for country towns, as it will enable them to put up permanent guide boards at a trifling expense; it is simply by burning the brands into a piece of board, then lightly plane it over, after which give it a coat of white Guide boards made in this way are much more durable than the common boards, and the cost is trifling. The above are offered for sale at 40 to 50 per cent discount from former prices, which will enable all towns to furnish themselves with a very useful article. May 18.

Wrought-Iron Ploughs, -Bar-Iron, &c. Wrought-fron Ploughs, of all sizes .- Also, A Complete assortment of American, English, Swedes and Russia Bar Iron-American Braziers' Rods-Spike and Nail Rods, Shoe-Shapes—Hoop and Band Iron—Steel of all kinds— Pipe-box and Mould-board plates, &c. constantly for sale GAY & BIRD.

6tis. No. 44, India Street, Boston.

For Sale, Full blood Aldnerney and Short Horn Bull and Heifer Calves.

Two Alderney Bull Calves, and one Heif r Calf. Also, one Bull and two Heifer Calves of the Short Florn or Teeswater breed, all from full blood imported stock, on both sides. For terms apply at this office. 4t May 11.

Yellow Locust Seed.

Just received and for sale at the Seed Store connected with the New England Farmer Office No. 52 North Market Street,

A few lbs. genuine Yellow Locust Seed, (Robinia nseudoacacia) saved near Harrisburg, Pa. expressly for this Establishment. The excellence of this tree for ship iblic, my aged father, and myself, requires this expositimber and fences, its rapid growth, and its beneficial effects on sandy, barren plains, where it thrives well, are too well known to require comment. Dahlia Roots.

For Sale, by David HAGGERTSON, at the Green England Farmer Office, No. 52, North Market Street, House, Charlestown Unequal, Edun-street, (on the 100 superior Grape Vines, Isabella and Catawba, south side of Bunker's Hill.) a superior collection of the above Roots, containing sixty varieties. The color of each kind marked with the name and warranted as described. This collection has been distinguished by general praise, and was awarded the premium last antumn by the Massachus, its Horticultural Society.

Also, an extensive collection of Green House Plants, and KEENS' Seedling Strawberry Vines, in pots, with ripe fruits at reasonable prices.

All the above roots and Strawberry Vines are for sale by Mr Russell at the Agricultural Warchouse, North May 4. Market Street, at the same prices.

For sale at the Arricultural Warehouse,

52 NORTH MARKET STREET,

WILLIS' IMPROVED BUTTER STAMPS ZI This is a simple, but elegant and useful implement, which moulds butter into a handsome rectangular, or cubic form, presses out the buttermilk; and by the same process fixes upon it a beautiful impression, which admits of being varied into such letters or figures as may best suit the fancy of the owner of the article.

Bees in Cities.

AN ESSAY on the practicability of cultivating the Honey Bee, in maritime Towns and Cities, as a source of Domestic Economy and Profit. By Jerome V. C. Smith, M. D. Just published by Perkins & Marvin, 114, Washington Street, and for sale by J. B. Russell, at the Agricultural Warehouse, No. 52 North Market street, price 38 cents.

> Dr Hull's Patent Truss. CASE OF MR FISHBURN.

DR HULL, Sir-Under the advice and direction of DR KNAPP, I have been cured within the year past of a bad rupture of 9 years' standing, by the use of one of your patent trusses. I had worn various kinds of trusses before I got one of yours, but they were very burdensome to me. Your truss, on the contrary, is comfortable to wear, and as convenient to put off and on as a pair of spectacles. I were it not to exceed five months, and found myself cure 1. I have not had it on for six months past, and have exerted myself violently at wrestling, umping, riding, and other hard exercises without any return of the complaint, not even a feeling of weakness in the part. In fine, your truss has made me as sound and well as ever I was; it is one of the most valuable H. N. FISHBURN. inventions in the world.

BALTIMODE, Jan. 1331.

Dr Hull's Trusses are sold by Eben. Wight, (sole agent for this city,) Milk-st. opposite Federal-st. eop3t

Sweet Potato Slips, &c.

This day received at the Agricultural Warchouse, 52 North Market-street, a further supply of Sweet Potato Slips-Price 17 cents per quart; 50 cents a half-pack .-Also, a fresh supply of Millet and Orchard Grass seed.

The Nuturalist,

DEVOTED to Geology, Botany and Mineralogy, edited by D. Jay Browne, and published monthly by Peirce & Parker, 9 Cornhill, Boston. Each No. contains 32 8vo. pages, accompanied with a plate. Price \$3 a year. The first five numbers of this work have been issued, the lirst five numbers of this work have been issued, the contents of which are as follows: Zoology. Man. The Beaver. The Bee. The Silkworm. While Ants. Botany. The Vine. The Melberry. The Lilae. The Weeping Willow. The Sugar Maple. Mineralogy. Platina. Gold. Silver. Mercury. The Culture of Silk. MISCELLANY.

From the Philadelphia Album.

NOTHING TO DO.

Alas! how very wearily The heavy hours roll by ! I wonder if there ever was A man so dull as I. From morning light to dim twilight There's nothing I can do, Except to cat, and drink, and write, And feel exceeding blue.

I wander with a stare forlorn Through many a well known street, And see how full of business Is every one I meet; And then I sigh to think that I Alone among mankind, Have not a thing to occupy

I heard one say the other day, That I had grown a bore, And did not seem to understand The purpose of a door-The paltry dunce! I lent him once A fifty dollar bill: He has not paid it to me yet-I guess he never will!

My fingers or my mind!

When now I call on Adeline, She never is at home-She says, she could not bear a man So much inclined to roam ; She has returned, and I have burned, My letters old and new :-'T is queer she did not think to send The watch I gave her too.

And now there's nothing I can do, So pestered by the blues! Our daily papers are not fit For Christians to peruse : I do not care for politics, Wais, trials, or debates-I skip all ' horrid accidents,' And never notice dates.

In vain--in vain I try to laugh, When Linton tries to pun-Hook as shrinkingly upon A punster as a dun. Uneasy thoughts seem folded in Each object that I see, The very grass I tread upon Is full of gloom to me.

The sky-the golden summer sky-You arch of dazzling blue Seems unto me a vapory mass, Of thick and leaden hue. O! I had rather ply the oar And toss upon the sea, Than live the mi-erable slave And victim of ennui.

Boston, April, 1831.

Y. P. L.

Evidence of the senses .- A roguish boy stole the glasses from his grandfather's spectacles, and when the old gentleman put them on, finding he could not see, he exclaimed, 'marcy on me, I've lost my sight? but thinking the impediment to vision might be the dirtmess of the glasses, took them off to wipe them; when not feeling then, he, still more frightened, cried out, 'Why, what's from one of his lordship's paternal epistles, this sencome now, why I have lost my feeling too!'

Samuel M. Hopkins, LL. D of Albany calculates that two cents and seven mills per day, will furnish healthy and comfortable food for a man and include bread, pudding, meat and jelly, potatoes, salt, vinegar, pepper, rye, coffee and moagges.

Coffee upon the nervous coat of the stomach is, unquestionably, a gentle stimulant; and as most substances of that class have to a certain extent, a tonic power, it may be safely recommended to individuals whose powers of digestion have been debilitated by stimulants of a more powerful character, such as fermented liquors, lake. The soil is principally a sandy toam, much of it wine, spirit, &c. The custom of taking coffee covered with rich black month. The timber is chiefly after dinner, and just before retirement to rest is bad; because its stimulant property on the nerves of the stomach exerts a power destructive to sleep; it promote: an activity of the mind, and gives a range to the imagination, which prevents had, is very large, fully equalling it not surpassing that Manual of Invalids.

ROYAL TENDERNESS .- The Emperor of China has reproved the sheriff for strangling the wrong so in future!

PRETTY Goon .- What dat you pie up dere. Sambo?' 'Dollar, Pompey.' 'Well juss leff 'em down again; I only put 'em dere to try you.'

A caoutchouc (India rubber) tree is mentioned as growing in a garden in Philadelphia. The Baltimore American says there is also one in the garden more American says there is also one in the garden and form two of a gentleman residing in that city. It somewhat to five year, credit for payment in annual instalments, resembles the fig tree.

There is one in Boston. It may be seen at the fruit store in the right wing of the Tremont House. It is a very beautiful thrifty sapling,

New way of blacking boots.-An Inn-keeper in Connecticut-who was prodigiously fond of a joke, and valued himself more on his gibes and jeers, than his good accommodations and honest reckonings one day, as he was sitting before his door, observed a raw looking young man from the country, whose boots were polished much beyond the general style of his appearance. Boniface thinking he would be a capital subject for sport, called to him.

'Here, young man, I wish to speak with you.' The fellow stopped, and Boniface proceeded.

'I admire the appearance of your boots-I wish you'd tell me how to black mine.

'That,' said the awkward looking fellow; 'you can do easy enough-jist rub them against your character.'

ANECDOTE.-The Duchess of Marlborough, at her evening conversations, occasionally covered her head with her handkerchief and was then supposed to be asleep. She was in that state one evening; at a time at which she was much displeased with her grandson, then Mr John Spencer, for acting, as she conceived, under the influence of Mr Fox, whose name being mentioned, she exclaimed, 'Is that the Fox that stole my goose ?'- The Marchmont Papers.

Sir Edmund Sugden, an eminent chancery barrister in England, relates that Lord Chancellor Eldon 'commonly gleaned the knowledge of the case he adjudged from the perusal of the documents, and not from the speeches of the counsel, and that he invariably divided the hours of his judicial sittings between the examination of papers, and a daily correspondence with a favorite daughter.' Sir Edmund cites tence: 'They suppose I am listening to their stupid arguments; they little imagine I am writing to you.

An Insect Pun .- In the Narrative of Discovery and Adventure in Africa, Wilson, having occasion to mention that a species of insect, called pausus, was the last described by Linnæus, says, in the language of Young, it was-

'An awful pause, prophetic of his end!'

Valuable and Cheap Land-for Sale.

The subscriber offers for sale, 14,000 acres of choice Land, situated in the town of Pinckney, county of Lewis and state of New York. Some of the land is improved and under cultivation. The country is remarkably healthu, being entirely free from the fever and ague and from the common bilious fevers which often afflict the towns upon Lake Ontario, this town being 18 miles east of the Sugar Maple, Black Ash, Butterout, Beech, Elm, &c. The land yields first rate crops of Grass, Rye, Oats, Barley, Potatoes and Flay; and on some lots, good Wheat and Corn may be grown. To those wishing to obtain superior grazing farms, a fine opportunity now offers itsell. from the same quantity of land in any other of the Black River townships. The land is admirably well watered, there being but few lots which have not durable running streams upon them. The land is well adapted to Orcharding-the Apple tice thriving very well in this county. Stock of all kinds may be disposed of with the least possisubjects by mistake, and requests them not to do ble trouble, and to the greatest advantage, the drovers purchasing at the very doors of the farmers, and paying the highest cash prices for their cattle, which will readily find purchasers at all seasons of the year. Several farmers at present residing on this town, were originally from the New England States, and some of them from Massachusetts, who are in thriving eircumstances. The above described land is offered for sale at the very low price of from two dollars and a half to three dollars per acre, for the uncleared land, and from three dollars and a half to five dollars and a half for the improved lots. The will be given. As a further convenience to purchasers, the subscriber will receive in payment, Cattle, Sheep Perk, Grain or Grass Seed, for which products he will allow the highest cash prices. The title to the land is indisputable, and good Warranty Deeds will be given to purchasers. Persons desirons of purchasing will please to apply to the subscriber, at Henderson Harbor, county of Jefferson, State of New York, or to DAVID CANFIELD, JAMES H. HENDERSON. Esq. on the town. March 9. ep16t

FOR THE NEW ENGLAND FARMUR.

FORM OF A ROLLER.

Mr Fessenden-Having lately seen two or more escriptions of Rollers in the Farmer, I will try give you the description of one I lately saw in ancaster County, Pa, at the farm of a friend of ine and which he says is the kind most approv-I of in parts of Chester County, Pa. A siick 6 et long and from 20 to 36 inches in diameter is be bored through with a 5 mch hole, then by acing blocks in each end find the centre of each ble and describe a circle on each end of the ick, as large as it will admit, from which dress round and smooth, and then with a cross cut wit in two which gives you two pieces of 3 et each in length; next prepare a good piece of ood for an axis, dressed round, and 4th of an th less than the hole bored, and long enough to a through both pieces and secure in the frame thatenon of 2 by 42 melies on each end; on e end is to be left a shoulder, inside of the tenand on the other a piece of board as a washer keen the roller clear of the frame in working, e frame consists of 2 pieces before and 2 bed, and one on each side; into the latter of ich is put the axis after having the two parts the roller and the washer put on. A tongue seured to the two front pieces of the frame with y chains to prevent strain in turning, and a ath and rings for breast chains on the end, a pin hole at the proper place for a double but where oxen are used nothing but 2 pins r the end of the tongue is necessary, and no is used in the construction except the stay ins and sheath. A box for giving it additionveight or for gathering stones may be placed er over the top, or, as is often done, to lengthen tongue, on the bind part of the frame. The antage of having the roller in 2 pieces is, that rns easier and without dragging the ground, n a short turn the pieces move in opposite di-

is said to work admirably .- My friend told that in cash laid out, his roller cost \$3; the he had of his own and took no account of ling it. He had a carpenter 11 days whom issisted and paid for also boring. If the foreg description has not been already given and think it will be of any use, you may publish it.

A PENNSYLVANIA SUBSCRIBER.

'ay 2, 1831.

BLIGHT IN PEAR TREES.

ipper extremity of one of my small pear trees agth, and so nearly of the color of the bark tions, which to me often proves a serious loss. e limb that it would not have been noticed by the enlargement of the limb. This protu-

because proves to be a worm, wrapped in a coat of mail, closely adhering to the wood.

The worm is alive. I send it, with the limb for your inspection. This worm has evidently caused the death of this shoot. Is not this the New England Farmer, I read a communication cause of blight in pear trees?

Yours respectfully,

Framingham, May 20, 1831.

Remarks by the Editor .- The limb of the pear trees, alluded to above, came to hand, but the insect had made its escape, and of course has evaded our observation. Biight is nothing more than another term for withering, or decaying suddenly; and whatever causes a fruit tree or other vegetable production to wither or will (as we express the drooping of a plant) is the cause of blight. London says ' Blight is a common term for injuries recrived by the vegetable kingdom, when in a state of growth, which cannot be referred to any obvious or certain cause, and coming suddenly is said to give them the appearance of being blighted or blasted.' Some writers attribute the sudden decay of the pear tree, commonly call d blight, to the scorching rays of the sun. Others imagine that warm weather in winter, or early in spring, sets the sap in motion, which subesquent cold weather arrests, and causes it to stagnate, and become corrupt in the pores of the alburnum. Others are of opinion that manuring too high, and prinning too much causes the tree to die of surfeit. Then there is abundant proof that blight in pear tices is often caused by scolytus pyri, a small insect, first accurately described by the late Professor Peck, and often taken notice of in our Journal. In all cases of blight, the only cure or palliation yet discovered is found in sawing off the affected branch or branches some inches below where the blight, or marks of disease appear.

PEACH TREES.

MR FESSENDEN,-During the time I have paid the orchard of apple trees at 40 feet apart. attention to the cultivation of Peach trees, viz, since 1820, I have observed that young trees are liable to be stung on the body and limbs by an insect, often fatally. The appearance produced being much discolored. On older trees in the each of course equi-distant from the centre, thus leaves and fruit are seen through the trees, the twigs to which they are attached having been stung. Also the fruit when half grown or more. stung in many places, at first occasioning whitish spots, which if the fruit in a knotty state it does not outgrow, results in rot, accompanied with a blua Fessender-Much has been written in ish dusty mould, which on touching, occasions the useful paper on the subject of hlight in pear speedy rotting of the adjoining fruit. Is all this occasioned by the sting of the same or different am not fully satisfied as to the causes of this insects? 1 presume cultivators generally in the t-today I noticed that nearly one fourth of middle states must have observed it .- An answer in the Farmer from Dr Harris, yourself, or any put out no leaves and was apparently dead, other of your learned or practical correspondents lose examination at the foot of the dead limb, or readers would be very acceptable, especially if tuberance was discovered, nearly one inch it contain directions for preventing said depreda-

FOR THE NEW ENGLAND FARMER.

PLANTING TREES.

Ma FESSENDEN-lu the 6th vol. page 301, of by Solomon Drown, M. D. recommending 'the ancient quincunxial mode of planting,' and having an orchard to plant the following spring, I concluded to dispose of the trees in that way. The piece contains near four acres, has two ravines meeting in it at an obtuse angle which renders it of little value for common farming purposes. The soil of middling quality and slaty. I commenced at the side where the hill was the steepest, and most extensive, and ran my rows of stakes so that in ploughing that face of the ravine, the plough would run in a horizontal direction, and continued row after rew until the whole was finished, when on examining the faces of the other slopes I was surprised to find that in every case the rows were so disposed as to admit of the plough running in a horizontal direction between. Had this piece been laid out in squares, I do not see that it could have been ploughed at all; as it is, under the most favorable circumstances, it has cost the life of a valuable horse by a fall while ploughing one of its steepest faces. However the piece, containing 104 apple and 310 peach trees (now in a flourishing condition) has been ploughed and sown with grass seed, and in future it is my intention to cultivate the trees by digging around them, as I shall never again attempt to plough it.

This spring I have planted another piece of uneven shape and sorface in the same manner. containing about 140 apple and three times as many peach trees. I plant my apple trees at 40 feet apart and between every two apple trees a peach. and again between every two rows of app'e an entire row of peach at 20 feet apart, which, upon the peach trees failing and being cut away, will leave

I think this manner of planting is preferable to squares in every case, but more particularly where there is an unevenness of shape or surface in the insect, often fatally. The appearance produced piece to be planted. The heauty of this manner by the sting is the oozing out of a darkish greasy of planting consists, in part in each tree being looking gum; on examination the stings can be the centre of a circle, whose circumference contraced quite into the alburnum, the inner bark tains six trees standing equi-distant therein and spring and fore part of summer, tufts of dead forming within the circle a hexagon, three rhombs or diamonds, or six equilateral triangles, and thus throughout the crchard. By way of illustration I send you the annexed diagram. The figure as extended, exhibits a large circle inclosing a hexagon, the latter divided into three rhombs, viz, one composed of diamonds, one of triangles and one of circles and parts of circles, a square and larger rhomb is also shown, and the places marked for trees after the quincunx order, extended to the whole and shewing how each figure would be filled thereby. But there exists a difference of opinion respecting what constitutes the quincunx; several of our encyclopedias and dictionaries and one of your correspondents stating it to be what appears to be nothing more than squares reversed, while in the place before referred to is

^{*} See Mr Drown's communication in N. E. Farmer. vol. vi. page 301.

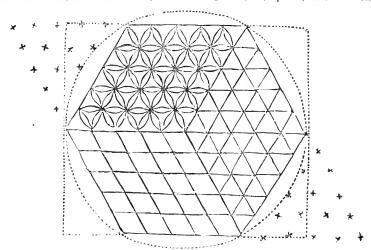

given what I suppose to be the real quincunx, viz, two letters V joined thus,

Where trees are to be planted in quincunx at 20 feet apart, I would recommend using two 20 feet poles, first running a straight line of stakes at 20 feet apart along one side, leaving sufficient room between the row of stakes and fence for a plough and horses to turn; then let the end of a pole be placed to the first stake and another to the second and the other ends of the poles be drawn together until they meet in the direction from the fence, where drive a stake; then place the poles to the 2d and 3d stakes, draw the ends together and drive another stake and so proceed till finished. If the piece is of uneven shape, noth-

ing more is nesesary than to change the line to which the ends of the poles are placed and they will meet in any desired direction, as it is noth- Proceedings of the Massachusetts Horticultural ing more than laying out one equilateral triangle along side of another and repeating the same thoughout. It requires one person to each pole and another to draw the ends together and drive the stakes. Where it is desired to plant at 30 feet or further, chains or tape lines may be used instead of poles. Where stakes have got a little out of place, in proceeding with the work, I have found it disposed to correct itself; where the ground is not level care must be taken to hold the I will read a communication from Sam'l. G. Permeasures in a horizontal position in laying out.

If you think the foregoing or any part of it Houses, Vineries, &c. would be of use to any of your readers, you are at liberty to pull ish it. Your friend,

Wrightsville, Pa., April 15, 1831. M

The following is a translation from the German Encyclopedia Dictionary, edited by Captain Pierer, Altenburg. 1829, and communicated for the New England Farmer by Doct. LIEBER.

Lentil. 1, in botany, the genus Ervum. 2. in gardening, the common lentil, L. lens, comes from France and the Valais. The thin, annual root brings forth weak, creeping, bairy, angular stalks, from 1 to 2 feet long, divided from near the bottom into several branches, and clinging for support to other plants; the feathered leaves stand alternately; from the angles of the leaves proceed fine stalks which each have two or three whitish flowers, hanging down. The pods do not contain more than two sound seeds, flat upon both sides. 3. in husbandry, lentils are cultivated in the fields for the seeds just mentioned. They require a rather sandy yet strong soil; they are sown somewhat later than peas and vetches (in the middle of April), because they cannot endure night frosts; the soil is to be plaughed in narrow furrows and well harrowed; care is to be taken that the seed is not put too deep into the ground and that the young plants are well hoed and well weeded. For the harvest (generally in the middle of August) the precise time is to be chosen, when the little pods begin to turn brown though the plant may be still quite green, and, if possible, it is best to choose the

afternoon of a dry warm day, for if the pods are quite ripe, or are wer with rain at the time of gathering they easily crack open, and a great loss of seed a, the large garden lemil, b, the common field the bottom. lentil; the former is distinguished by its size and the they are then cooked half an hour more. A good [throughout the house. soup may also be made of them. Some persons soften the lentils before cooking in cold water. Purified rain water is best to cook them in. In the Archipelago they are one of the principal articles of food. Formerly the meal of lentils, (farina lentis) was used by apothecasies. To fatten pigs, lentils are excellent; and given with other food increase the milk of cows.

Morticulture.

Society, at the Exhibition meeting, held at the Hall of the Institution on the 28th of May, 1831. Report in de by H. A. S. DEARB ORN, President of the Society.

On a recent occasion, I alluded to the meritorions services, which had been rendered, by several distinguished horticulturists, whose names are enrolled among the members of our Society, and in confirmation of the assertion, that their ardor had not abated, for the advancement of rural culture, kins, Esq., on a new method of warming Green

Brookline May 21, 1831.

GEN. H. A. S. DEARBORN,

Pres. Mass. Hort. Society. Sin-Agreeably to my promise I have now the honor to submit to your consideration the result of my first experiment on the application of hot water in heating Hot Houses or Vineries .- I must however, premise, by observing that at the time this experiment was made, my house was unfinished; the west end, where a well is now built. where the reservoir is placed, was then entirely open; besides his there is an opening at the other end of the house directly over the boiler; of course there was a free current of air through the vinery which prevented me from ascertaining the degree of heat which the apparatus would give to the house when shut up .- This experiment was made on Friday evening last, 20th instant, when the mercury stood in the open air at S P. M. at 57 degrees-and the reservoir was entirely exposed, uncovered, to this temperature.

The boiler and reservoir are of cast iron, containing each about 80 gallens,-their diameter is about 3 feet, and their depth 224 inches. The honse is 80 feet long in which they stand, the boiler at the east, and the reservoir at the west end of course the length of the pipes that connect them is about 74 feet. These pipes are introduced or open into the kettles as follows-viz. the upper edge of the upper pipe is within three inches of the top of the rim; and the under edge of the under pipe is a little below the perpendicular or straight line of the side of the kettle, which brings it (as the lower part of the kettle is takes place. Two varieties are generally cultivated; somewhat dishing) within two or three inches of

The pipes are of cast iron, 41 inches in diamegreater quantity of mealy substance which it will after within the bore, -but the exterior of the pipe ford, but not by a better taste. The straw of lentils is presents a surface of 163 inches, making in the two good food for cattle and slicep, particularly for calves pipes a surface of 33 inches. -These pipes are and lambs; lentils are also mixed with vetches laid perfectly horizontal; of course when you fill and sowed as food both green and dryed for mileh your boiler you fill your reservoir in the same dekine. 4. Nutriment. Lemils when cooked afford a gree; the proper point when filled for operation nutritions food, (this should be done in the pod to being an inch above the upper edge of the upper preserve their flavor) but like peas and beaus are pipe. - The pipes are computed to hold about 115 not good for persons whose digestive powers are or 120 gallons of water, which together with that weak, particularly if they are not cooked quite soft, which is contained in the two kettles when filled They ought to be cooked for two hours and a to the proper height, say 140 gallons, makes 250 half; when they are browned, some butter and or 260 gallons of water to be heated, before the a few onions reasted in butter are added, also salt : full effect of the apparatus can be experienced

At about 6 o'clock fire was put under the boiler with some light fuel; in half an hour the heat was sensibly felt in the end of the upper pipe next the boiler; at 7 o'clock the mercury stood in the boiler at 120,-and in the middle of the reservoir it s'ood at 96-but at the mouth of the upper pipe that opens into it, it rose to 100. At this time the upper pipe gave out considerable heat of the pipe it rose to 120.

The under pipe was now warm as far back as the rom the upper pipe into the reservoir after the hat I was satisfied there was no difficulty to be pprehended, and being troubled with rheumatism, he evening air bring cold, I left my gartener o watch its progress, and to report to me the ext morning, which he did as follows:

Soon after I left him he went to his supper and ound on his return the fire had burnt down, but vas renewed and kept up until the temperature of he water in the boiler was 176, and that in the eservoir 156,-this was a little after 2 o'clock. ic upper pipe was now very bot, and the lower one iving out heat throughout its whole extent. Soon fter, the fire was allowed to go out, which it did ery readily, as it was supported only by pine chips, nd some half rotten chesnut po is that had been ut of the ground a few days previous. The next torning at half past five, I found the temperature fthe boiler, at 88; this, considering the open state I the house, and especially over the boiler, was gher than I expected to find it, particularly as e night air was quite cold .- Had the house en closed, it would have made a great difference the temperature of the apparatus in the morng,-the water in the boiler would have been eated somer, and of course that in the reservoir id the pipes would have been sooner in a state communicate warmth to the house, had the ld air been excluded.

I think, when the house is closed at both ends, e boiler may be raised to 185 or 190 degrees two hours, at which time a peck or a peck and a If of Lehigh coal will keep up the heat during e winter nights of Jan'y and Feb'y .- The obction to the large boilers is, the time taken to at so large a body of water; but it must be collected that during the whole time of its heatg, it communicates a portion of its caloric to the bequently to the other end, as the heat increases the reservoir; so that the fuel employed in respectfully, ating is not lost entirely at any time; for long fore the whole apparatus is heated, the tempere of the house will be found to have changed: leed, all the heat which is communicated to the ter must be given out again; and as it has no

ment heat is felt in the boiler. ge body of water is heated, it takes a much heat, so that the gardener may retire to his rest full confidence of finding his house in good heat the morning,-in this point of view it has a eat advantage over brick flues; as it frequently ppens that gardeners are obliged to set up half

at half past 7 o'oclock the mercury stood in the this means. Besides, brick flues cool very soon feet in length, intends to heat the whole range poiler at 141 and in the moddle of the reservoir it after the fire has gone down, whereas, a large with hot water, in the manner so successfully tood at 116 -but upon its being put to the month body of hot water will continue to give out heat adopted by his brother. He has a Vinery 300 many hours after the fire is extinouished,

Another important advantage in heating with centre towards the boiler. The top of the reser- hot water is the saving of fuel ;--a house 80 feet roir being open during the whole process of heat-long requires two furnaces, and two flues, each 40 ng, you could see the movement of the hot water feet, to keep up an equal heat at both ends of the house; and it is difficult to heat these sufficiently poiler had attained the temperature of 120,—the with Lehigh coal, at their extremities.—Whereas cat of the lower pipe had increased so much by the hot water process you require but one furnace, and the whole consumption of coal must be much less in this, than in one of the fornaces attached to brick flucs, because these, to be heated to any extent, require a strong draught, which of course consumes the fuel with rapidity; but when this fuel is applied to the heating of a kettle, set them. over a well and judiciously constructed fire place and smoke floes, there is no waste or loss of fuel, as moderate draft only is required.

Another very important reason in favor of large boilers and large pipes is the extent of surface from which heat is given out into the house; and when compared with any single brick flue it is as 33 to 18; for instance, the pipes in my house each present a surface of 16 inches, making 33 inches surface together. Now the largest size tiles which are used here, at least the largest that I have seen, are 12 inches square; an inch on each side lodges on the brick, of course they present only a surface of 10 inches on the top, from which heat is given out freely .- Beside this there are 4 inches on each side of the flue, where the bricks stand edgewise; this added to the ten on the top makes 18 inches .- The pipes therefore present 83 per cent more surface than the flue, through which heat is communicated to the house, to say nothing of the surface of the top of the boiler, and the top and sides of the reservoir, which added to the pipes, would make 100 per cent in favor of the hot water system on the single point of medium through which the heat is communicated,

think that heating not houses, vineries, &c, by the Ranunculus for premium. application of hot water is more efficacious, more certain and uniform, and more economical than heating by brick flues.

I shall, whenever my house is closed in, make use-first to that part nearest the boiler, and another trial of the apparatus, and a further report on its effects, and in the mean time I remain variety of Honeysuckle is one of the most orna-

Your obedient servant. SAMUEL G. PERKINS.

The very important discovery of distributing heat throughout the most extensive Green Houses, cape but into the house, the air or the tempera- and Vineries, by the means of boiling water, is e of the air therein, must be rising from the destined to have a very favorable influence, on the horticulture of all countries, situated beyond the Another reason for preferring large boilers and tropics. In Great Britain, the experiment has ge pipes to small ones is, first, that where a been made with complete success, and we are much indebted to Mr Perkins for having made iger time to cool it than it does to cool a small- the apparatus known in this country, by a practivolume, during all which time it is giving out cal application, on a large scale. There cannot heat into the hoose, -2. When a large body of be a doubt, that hot water will be universally ter is heated, a small quantity of coal will keep up adopted, as a sobstitute for steam and hot air flues, to heat Green Houses and Vincries, while the former, will be combined with the apparatus, as the best mode of irrigating the foliage of plants, requiring protection.

It is understood that Col. T. II. Perkins, who night to watch and renew their fires in the is erecting a Peachery, Vinery and Green House nter season, when their houses are heated by within his magnificent grounds at Brookline, 280

feet long, which was built some years since, warmed and irrigated by steam.

It is cheering to behold the rapid increase of Green Houses and Vineries, in all the beautiful villages which surround our capital. Within three years from lifteen to twenty have been erected, and others are in progress. While gentlemen of fortune thus embellish their country seats, practical gardeners find them profitable appendages to their establishments; as the sale of the flowers and fruits, which they are enabled to cultivate affords an ample remoneration for the expense of the editices and the labor of superintending

Respectfully submitted, by

H. A. S. DEARBORN. Pres. Mass. Hort. Soc.

Horticultural Hall, Saturday, May 21, 1831.

This being the day appointed by the Committee for awarding the premium on Tulips, the number and beauty of the flowers exceeded that of any previous exhibition.

Fine specimens of tulips were exhibited by II. A. S. Dearborn, of Roxbury, Z. Cook, Jr, of Dorchester, John Prince, of Roxbury, P. B. Hovey, of Cambridgeport, S. Walker, of Roxbury, D. Haggerston, of Charlestown, Otis Pettee, of Newton, Rufus Howe, of Dorchester, Charles Lawrence, of Salem.

A branch of the double flowering hawthern from the garden of John Prince, Esq. was particularly admired.

Rich bunches of Flowers from the gardens of Henry A. S. Dearborn, Z. Cook, Jr, and Charles Tappan.

From Otis Pettee of Newton, a fine specimen of double rose colored Pacony and Calla æthiopica. An Orange branch with fruit from E. G. Austin. Under this view of the subject, I cannot but P. B. Hovey exhibited many fine specimens of

Messrs Winships from the nursery at Brighton, exhibited a fine collection of hardy shrubs and herbaceous plants, including five distinct varieties of Lilac, and the beautiful shrub Lonicera tartarica, or upright Tartarian Honeysuckle. This mental shrubs which can be introduced into a garden, being perfectly hardy, of vigorous growth, and covered at this season, with the most delicate and interesting pink flowers,

The standing Committee on Ornamental Trees, Shrubs and Flowers, award the premium on Tulips to Mr David Haggerston of the Charlestown Vineyard. R. L. Emmons, Chairman,

May, 21 1831.

farming or gardening, a proper attention to the onion kinds, and lighter crops, as salads, &c, by fully accounted for by chemists. The rationale of In no case should any of the brassica tribe follow rotation is thus given by Sir Humphry Davy :-of cultivation, that the whole of the manure be another. Thus, if the turnip be the first in order of succession, this crop manured with recent dung immediately finds sufficient soluble matter for its nourishment, and the heat produced by fermenta- by nature; for all percunial herbaccous plants growth of the plant. If after turnips, barley with grass-seed he sown, then the land little exhausted by the turnip crop, affords the soluble parts of the decomposing manure to the grain. The grasses, rye-grass, and clover remain, which derive a small part only of their organized matter from the soil, and probably consume the gypsum in the manure, which would be useless to other crops; these plants, likewise, by their large system of leaves, absorb a considerable quantity of nourishment from the atmosphere, and when ploughed in, at the end of two years, the decay of their roots and leaves afford manure for the wheat crop; and at this period of the course, the woody fibre of the farmyard manure, which contains the phosphate of lime, and the other difficult soluble parts, are broken down, and as soon as the most exhausting crop is taken, recent manure is again applied,

G rdeners should pay particular attention to rotation of crops, as far as the name of the thing will admit of; a good practice is to sow down part of the garden every season in grass, clover, to ripen; thus it acts as a nurse and a shade to the clover. But in all cases where this is done, let the ground be laid down in as good condition as possible, and the manure laid on will not be lost .--Land thus laid down should continue so for two years, or if for three, the greater will be the benefit. However, this is generally regulated by the quantity of ground which can be spared from crops, for the time when the ground is wanted. The crop of grass, if dug in, but not too deep, for reasons given already, will materially improve the soil; but on no occasion whatever trench it in, as is too often the case. This practice, although excellent, can however only be applied to gardens on a largeextent; for its adoption would not be attended with the same advantage in the general run of our gardens.

By a rotation of the perennial crops, such as quartering out currants, gooseberries, and raspberries, &c, the ground will not only be renewed, but also rested, or at least very much improved. above twelve years, and not less than three; this, together with trenching for the principal crops of antumn-planted brassica will keep the ground in considered the most proper :fresh order, and be attended with no loss of space; for in all large gardens, and the generality of small ones, new plantations of these thangs should be made to a certain extent annually, which will throw a certain proportion of ground into regular rotation. &c;

In cropping all gardens, as far as it can be rendered practicable, rotation should be aimed at, and SYSTEMATIC ALTERNATIONS OF CROPS thus, by keeping all the legumes, as peas and beans, In the cultivation of the ground, either in the biassica or cabbaire kinds, the bulbous or regular rotation of crops forms one of the first themselves, each following in regular succession, and principal features of good in magement, al- the garden would not only look better, but would though its beneficial influence has not yet been to a certain degree, produce the rotation required. another upon the same piece of ground, neither 'It is a great advantage in the convertible systems should peas follow peas, nor beans, beans; onions are probably, the only exception in garden for potatoes or carr ts. employed; and that those parts of it, which are not culture. A journal, or plan of the garden should fitted for one crop, remain as nourishment for be kept, and the ground divided into portions, each of which should be numbered and a careful record kept of all crops, manurings, trenchings, &c.

The necessity of rotation is pointed out to us tion assists the germination of the seed, and the have a tendency to extend their circumference, and to rot and decay at their centre, where others tions may be put into the soil, so as to succeed of a different kind, spring up and succeed them, with much greater certainty, and in a much more This is particularly exemplified in the strawberry, perfect manner, than is usual in the ordinary methand all such stoloniferous growing plants; mush-jods of putting them into the ground .- English rooms are said never to rise two successive years Practical Gardener. on the same spot. The production of the phenomenon, called fairy rings, has been ascribe I to the power of the peculiar fungus, (Aguricus orcades,) which forms it, of exhausting the soil of the nutriment necessary for the growth of the species, -The consequence of which is, that the ring extends itself annually, as no seeds will grow where their parents grew before them; at the same time, that the interior of the circle has been exhausted by succeeding crops; but in those places, where the fungus has died, grass has grown luxuriantly, nourishment being thus left for the support of grass and other plants, after the agaricus has exhausted all that was destined by nature for its support.

All crops for a few years thrive well on newly turned up virgin mould, but in a few years they and barley, which may be used as green food for degenerate and require a fresh soil. Land, in the sufficient growth to afford a good bite, the hogs are horses and cows. The barley should be sown course of years, often ceases to produce the most let out of the pen and put upon pasture (clover is the with the clover, and cut down, not being allowed common vegetables, and fields which are well laid [best] in which there is plenty of running water, and down with cultivated grasses, lose every one of fed regularly about two quarts of corn meal to each them in a few years; they become, as it were, tired hog, per day-kept well salted, and, occasionally of them, but the truth is, that they have exhausted the nourishment proper for their respective sorts, and consequently die, and give place to others. This fact is frequently experienced by botanists to their regret, for a plant is often found weather is cool enough for butchering. Since in abundance for years, in one field or wood, and in course of time wholly disappears.

From the general richness of garden-ground, and much manure being constantly employed in the raising of garden-crops, much less attention has perhaps been paid to the courses of cropping fattening in the fall upon raw corn and cold water. in the garden, than in the field. It is, however, equally necessary in one case as in the other, and the same principles are applicable to both.

A variety of circumstances, however, conspire, to prevent its being so effectually accomplished in the garden as in the farm; such as the smallness of the portions of ground generally allotted to this None of these crops need occupy the ground use; the vast number of articles which are to be grown, and their great similarity and relation to each other. The following classification may be

Broccoli, cabbage, cauliflower, and savoys; Common beans, French beans, and peas; Carrots, beets, and parsnips;

Turnips, carly potatoes, onions, lecks, eschalots,

Celery, endive, lettuce, &c, &c;

It is found in practice that celery constitutes an excellent preparation for asparagus, onions and caulitlowers.

Turnips or potatoes are a good preparation for eabbages or greens.

Broccoli or cabbages are a proper preparation or beans or peas.

Cauliflowers prepare well for onions, leeks, or turnins.

Old asparagus land affords a good preparation

The strawberry, current, gooseberry, and raspberry, for the same.

Turnips give a suitable preparation for celery or endive; and peas, when well manured, are a good preparation for spinach, &c.

By properly attending to all these different points of management, crops of almost all descrip-

MANURE.

Farmers should make it a point to get as much manure as possible in the ground in the spring. They thus save a great deal that is lost by evapora: tion when the manure is left in the yard until summer and then carted out into the fields. The decomposition, too, is more gradual in the spring. affording food to the plants according to their inereasing wants.

Fattening Hogs .- A writer in the Genesec Farmer, remarking on the article on this subject in the last New England Farmer, by a ' Scientific, Parmer,' gives the following directions.

· In the spring as soon as the grass has attained a mix with the feed a little sulphur, salt petre, &c, as preventives against disease. About the first of October, they are again shot up and fed high a few weeks upon boiled potatoes and corn, until the adopting this method, I have always realized from a hundred to a hundred and fifty pounds more pork with the same express than I could get from a hog of the same quality (in the spring) treated in the usual pranner of pasturing during the summer, and

I have never been able to make hogs grow very rapidly upon grass alone, but with the aid of a little grain they may be made to thrive and grow much faster than one would suppose, who has not tried it; and when fed in such small quantities, while running to grass, they will thoroughly digest it without boiling. There are other advantages derived from fattening hogs during the summer-they are always peaceable and contented ; your pork is ready for the fall market, and the trouble is out of the way before cold weather comes on.

Those who keep a dairy, and feed their whey and butternilk to logs would find it much to their advantage, I think, to mix with it a little meal, as hogs fatten much faster and easier in warm than cold weather.

LAMPAS OF HORSES.

As the season is now approaching when that subject.

Ve are sensible that some of our most enlightd readers will say, that this article should apputting it there

lost of the articles which have been placed uns, than partaking of the barbarous; rather sutitious rites and ceremonies, appertaining to erty, than any retained usages of the dark of hurbarity. At what time or with what le this practice originated, we will not pretend ty; but there is one nation who should either ontinue the practice, or else say less on the gendiffusion of useful information; that is Amer-

he idea that the enlargement of that part of oof of a horse's mouth, is a disease, has long exploded by all veterinary surgeous. All es are subject to it, between the ages of three five, more or less; and in many cases, this soft gy enlargement, descends to a level with the teeth, without marks of tenderness or inflamon indicating disease, and if left to the operaof nature, will disappear, and the horse will a sound and healthy mouth; not to speak of anger of bleeding the horse too freely, by onthe palatine artery, the manner of performie operation, is shocking to the feelings of hutv. as well as painful to the animal. It is un-I for ; and must be considered a piece of wanruelty .- Genesce Farmer.

under fatal to Goslings .- A writer in the sican Farmer says, in a late thunder storm the ning descended in a field, within less than half e of my dwelling, and killed two laborers and prostrate and injured three more. But the efa my fowl yard was very remarkable. I had proods of goslings, one nearly a week old, on round, and another, two days, in a basket in se. At the instant when the thunder fell. vit did with the most astounding force, the in who had the care of the fowls, happened looking upon those in the basket, and saw at once, all fall over upon their backs and ex-Those in the yard, half an hour after, were dead also; a nest of eggs under a goose, then ogress of hatching, were all killed. You may n the correctness of this statement. Though igs are easily raised, and live more than a ry, they seem to be endued with nerves of nmon sensibility, or to have systems peculiarorable to electric impressions.

French chemist states that potatoes one third I, effectually supply the place of soap in washnen. That their faring is a useful ingredient rch, has long been known,

rrying Cows .- Cows should be curried as as horses, particularly when they are shedding hair. Independent of other consequences, it to prevent them from licking themselves, by they too often swallow the hair, and receive

TREES.

No rains and no reasonable expense should be ne people commence one of the most cruel and spared by the farmer in setting out useful and ornabarous of practices ever retained by any people, mental trees around his house and the public road, tending to be civilized, viz: that of burning out. He should do this for his own interest and from lampas from the mouths of young horses, patriotic feelings. Our fathers made sacrifices for cannot refrain from making a few remarks up-jour country with sword in hand. It belongs to their children to make them with the spade. The necessitous calls of our country are so few, that a patriotic spirit is in danger of becoming too quiescent. r under the head of VULGAR ERRORS; but yet It should be said of no farmer, in any part of the have what we consider a reasonable excuse for Union, that he has not patriotism sufficient to set out a tree to ornament his house or the public 10ad. The good of the country requires that a that head, in our paper, are rather innocent delu- mulberry tree should be planted in every unoccunied corner.

> Yellow Locust, Robinia pseudo acacia-Mr Wm. Buckminister of Framingham, encouraged by a premium of tifty dollars, offered by the Massachusetts Agricultural Society, sowed some seed in 1828. He first poured bo ling water on them and let them soak three or four days. He then sowed them in his garden. - In the spring following, he transplanted them in word-out land, in rows eight feet apart and four feet distant in the rows. On an acre he has 1000 trees some of which are four and a half inches in circumference. Many a farmer would add to the value of his farm by following this example,

> Prevention of the Mildew on Peach and Nectarine Trees .- The following preventive of the mildew on Peach and Nectarine trees has simplicity, as well as the experience of many years, to recommend it :- Take of sulphur and rain or river water. proportions of two ounces of sulphur to every four gallons of water. Put the quantity which may be required into a copper or boiler, and let it (aftern commences boiling) boil for half an hour; after which it may be taken out, or suffered to remain until it becomes of a tepid state, when it ought to be applied to the trees by means of the garden engine or syringe as in a common washing with water. The time for applying it is annually, as soon as the fruit is set and considered out of danger. -Loudon.

> Harresting Oats,-It is much the best way to mow (not to reap) oats when beginning to turn vellow, whether they are wanted for fodder, or for the oats with the fodder. If a farmer wants to make the most of his oats, if they are ever so stout, let him mow them when beginning to turn vellow Dry them well, thresh them as much as he pleases and his cattle will eat the straw in preference to the best meadow hay; and besides the grain will be much brighter and beavier than if they stand in the field till quite ripe, and the straw is spoiled .- Detroit Cowier.

Ernortation of Cattle.-During the first three months of the present year, there have been exported from New Haven to the West India Islands nearly one thousand head of cattle, horses and mules, amounting in value to more than fifty thousand dollars; being a much greater number and amount than was ever before exported from this place in the same length of time.

Chickens destroy Insects .- D. T. recommends, in the Genesee Farmer, as the most effective plan to destroy insects, to put chickens, as soon as they leave the nest, into the garden. The hen is confined under a coop.

NEW ENGLAND PARMER.

BOSTON, WEDNESDAY EVENING, JUNE 1, 1831,

FARMER'S WORK FOR JUNE. LUCERNE.

We believe that the frequent complaints of the failure of lucerne in this country might be traced to the tenderness of the young plants, and the soil becoming monopolized by weeds for want of thorough culture the first season. Young's Calendar for June, says 'The Jucerne drilled in the spring, will now want attendance. It will not be advisable to horse hoe it the first year, because its great tenderness will not bear any accidental evils that may arise in the operation, but the hand hoe should be kept diligently at work; the land kept throughout this mouth perfectly free from weeds, and the surface well broken by hoes, to prevent any degree of binding. While the men are hoving they should never omit to stoop and plack out such weeds with their fingers as grow among the plants in the rows: this is highly necessary; for if they are left they will injure the young lucerne much. Whoever cultivates the grass, must absolutely determine to spare no expense in the eradication of weeds. There is no plant will bear the neighborhood of weeds so badly, and especially while it is young. If the hand hoes are applied in time and often enough, the expense will not be great; but if, through saving, you defer it till they are gotten much ahead, the crop will either be lost, or the expense of clearing enormous.

KILL CATERPILLARS.

It is strange that the owners of orchards should permit caterpillars to overrun their fruit trees, when a little time and attention might rid them of the nuisance. A rag fastened to the end of a long light pole well wet with strong soap suds, and applied to the nest is an approved, cheap and efficient remedy. Care should be taken to attack the insects when they are in their nests, either morning. evening or in cloudy weather.

YOUNG FRUIT TREES.

Sir John Sinclair observes in the Code of Agriculture ' It cannot be too strongly inculcated that to permit young fruit trees to bear fruit too early is to do essential injury to their future fruitfulness and duration.' The fruit should, at least on young trees, be thinned by plucking it carefully by hand, till there is no more left, than will be sufficient to serve as a sample of the product of the tree, and show whether it would be desirable to engraft it.

DESTRUCTION OF INSECTS.

In the progress of preparing tobacco for use, a liquid is finally expressed from it, which is very cheap, and highly destructive to animal life. This mixed with from three to five parts of water. is found to be an effectual remedy for the aphis, caterpillars, and other insects of every description.

TAR FOR SHEEP.

We have been assured by a gentleman, who kept a large flock of sheep, that, during the season of grazing he gives his sheep tar at the rate of a will a day for every twenty sheep. He puts the tar in troughs, sprinkles a little fine salt over it and the slicen consume it with eagerness,

SALT FOR CATTLE AND SHEEP.

All domestic animals, which subsist on green and fresh food require salt. It is recommended to keep it under cover, in such a situation that cattle and sheep may have recourse to it at pleasaccustomed to so free an use of salt should be brought to it by degrees. We have been informed by a practical farmer that in giving salt to his cattle and sheep, he mixes it with unleached wood ashes, at the rate of one quart of fine salt to one half bushel of ashes. To this composition his cattle and sheep always have access. He thinks that they fill their stomachs speedily, is of not less it increases the appetite and improves the health importance than economy. See Communications to of the animals.

COPPERAS WATER FOR SEED CORN.

We have several times adverted to contradictory testimonies relative to the benefits of a solution of copperas for soaking seed corn. We recently conversed with an intelligent farmer, who assures us that he has used the solution for several years and found it a perfect antidote against the wireworm, or red-worm, an insect which attacks the seed corn under ground before it vegetates, -That last season, he planted a port of a field with corn prepared with copperas water, but not having enough prepared to finish the piece, a few rows were planted with corn, without any preparation. Most of the latter was destroyed by the wire-worm. but the prepared corn wholly escaped. He says, however, that the solution of copperas is not a preservative against the cut-worm. This last named insect is an ash coloured worm, with a stripe almost black on its back, which eats off the stem of the young plants of cablages, canbilowers, &c. as well as of corn, near the surface of the ground. This gentleman is of opinion, that the solution of copperas is a perfect antidote against the wireworm, but of no use against the cut-worm; and thus reconciles the apparent contradiction relative to the solution of copperas preserving corn against insects

DESTRUCTION OF INSECTS.

Forsyth says the leaves of walnut, steeped in boiling water, and that infusion mixed with lime water, soap suds, and urine are found very efficacious for destroying slugs and worms in the ground and insects on trees.

PRESERVE INDIAN CORN AND POTATOES AGAINST THE OCUR WORM.

The farmers of Reasselaer county, N. Y. say that ashes or quick lime ought always to be applied to the top of corn hills soon after planning, if it follow sward, to prevent grob larvae from destroying it. The same applications will have a similar effect, if applied to the top of potato hills, but neither unleached ashes nor lime in its quick or caustic state should in any case be allowed to come in contact either with the seed corn, or the young plants.

BOILING

Is a term applied to the practice of cutting herbage crops green for feeding or fat ening live stock. On all farms, under correct minagement, a part of this crop is cut green, for the working horses, often for milk cows, and, in some instances, both terested in the subject. But few farmers make for growing and fattening cattle. There can be no any pretensions to veterinary surgery, and it candoubt of the advantages of this practice, in regard to horses and cows; but for young and for fattening beasts, a sufficient number of experiments are not known to have been yet made with any great degree of accuracy. Young animals require exercise in the open air, and probably will not be capacity. In compiling it we consulted the most found to thrive so well in houses or fold-yards du celebrated and skilful farriers, and endeavored to ring summer, as in pastures; and though in every select everything that would be useful to farmcase there is a great saving of food, the long woody ers on this subject, and at the same time to exand comparatively naked stems of the plants, with punge all that would not be immediately connect- are occupied in the encouragement of agriculoaves more or less withcred, are perhaps not so ed with their interest.

Those cattle, however, which have not been valuable in the production of beef or fattening stock as a much smaller weight of herbage taken in by pasturage. Milk cows, however, are so impatient of heat and insects, that this way of feeding them at least for a part of the day, in warm weather, ought to be more generally adopted; and the convenience of having working horses always at hand, besides the Board of Agriculture, vol. vii. Brown's Treatise or Rural Affairs, vol. ii. General Report of Scotland, vol. ii. and iii.

HEATING HOT HOUSES BY STEAM.

We would beg leave to solicit the attention of our readersto the article under the head, of 'Alesschusetts Horticu'tural Society,' in this day's paper written by S. G. Perkins. Esq. with remarks on the same by Gen. Dearborn. We highly approve of the object, and are happy to perceive the successful results of Mr Perkins' experiment. Haying devoted some attention to heating apartments &c. by hot water and steam, we intend as soon as room and leisure will permit to offer some observations on the economy of heat.

several public spirited individuals in this vicinity are making exertions to introduce the culture of silk into Massachusetts. One gentleman in Middlesex County intends to have under culture next year one million of white mulbery trees, which will be sold at the bare nominal cost. He has now growing a large number of trees and is making preparations to raise 300,000 this season. Mr D'Homergue of Philadelphia has been consulted on the subject and invited to establish a silk Filature at Lowell, which he is willing to do as soon as coroons are raised in this quarter in a sufficient degree to justify it. The general introduction of the culture of silk into New England would justly be considered an anspicious era in the agricultural prosperity of the country.

Farmer's Farmera,—illustrating the peculiar nature and characteristics of the Horse, and diseases to which he is hiddle, with the symptom and bronches tamburly exchanged sorton-poined with the Pedigger of the blooded houses in the West, with severed elegant Bordsrayings. By H. L. Birtonia, Editor of the Funded States Agreedition, and Farmer's Reporter, Continual, published by A. B. Karp, and

The above is ropied from the title page of a valuable book lately presented to us by the publisher, after having been bound, gilt and lettered in a beautiful manner. The following extract from the preface of the work will exhibit its object and claims to public patronage in a manner equally concise and perspicuous,

'The most of the publications on Farriery are either too voluminous and expensive, or so abstruse as to render them little better than "sealed books" to the majority of those who are most in not be expected that they will understand all the technical terms which generally characterize publications on Farriery, therefore we have attempted to form a concise, simple and correct treatise. which will be intelligible to any person of common

The book appears to us to fulfil the promise con veyed by its preface, and of course is a valuable as quisition to the community, as well as the class (mankind for whose use it is most directly adapted The following extracts may serve as a specimen.

'The horse is a bold and fiery animal, even in a domestic state; he faces death with order and mag animity : he delights in the turnult of arms an seems to feel the glory of victory; he exults in the chase; his eyes sparkle defiance on the cours and his whole air bespeaks spirit and energy. H is nevertheless docile and tractable; he know how to check and govern the vivacity and fire o his temper. He appears pleased to yield to the hand that guides him, and to consult the inclina tions of his master: he in some measure, appear voluntarily to resign his very existence to the pleasure and accommadation of man; his educe tion commences with the loss of liberty and i finished by constraint. Who could endure to see so noble an animal abused? Who could endure such barbarity? The Arabians consider the horse a valuable present sent them from beaven, and they consider it a religious duty to treat it with that respect which is due to the great Giver of se valuable a gift. Could so much be said for those Culture of Silk .- We are happy to learn that districts of the world which are termed civilized and distinguished by the exalted epithet-Christian?

TO PREVENT WORMS OF EVERY DESCRIPTION. Keep a handful of wood ashes in the bottom of your manger, and salt your horse at least every third day; this will also prevent many other diseases. The ashes will prove destructive to worms. (if any exist,) and is also a gentle cathartic. The nature of the animal requires salt, without which he cannot be fattened, nor his bowels kept in a healthy state.

Tree Pagny .- The Hon. JONATHAN HUNEWELL has sent to the office of the New England Farmer a beautiful specimen of this magnificent plant. It is three feet high, covered with 30 blossems, some of which are 18 inches in circumference, of a light purple color, intermingled with some paler shades. and of a mild agreeable fragrance, forming a rare combination of splender, delicacy, and fragrance. This plant is extensively cultivated in China, of which they have several varieties, some of which it is said, were formerly sold for 100 ounces of gold. It is there held in such high esteem, as to be called the 'King of Flowers,' Mr Prince of Flushing has specimens in his garden that have produced 50 flowers each, annually,

Roses.-A magnificent show of Scotch Roses, in bloom, is to be seen at Messrs Winships' Brighton Nursery. Of this unique and delicate rese, which is at present so fashionable in Europe, there are about sixty varieties under cultivation at the Brighton nursery. Their collection of other roses comprises upwards of one hundred and filty choice varieties, which will soon be in bloom.

Horticultural Curiosity. - Mr Emmons has growing in his garden in Eliot Street, a Grape Vine that in November last was covered with fruit in Rochelle, France. It has blos-omed well this spring, and gives promise of another fruitful product in Boston.

Scientific Societies .- It is estimated that there are above fifteen lambled learned and scientific societies in the world: above one half of which ture, manufactures and commerce.

fesses Engrous-Mr Amos Russell, of Deer-(, (Bloody Brook) killed on the first day of ch last, five pies, a few days less than a year their exict age not being known, which thed respectively as follows: -285, 310, 331, and 352; making in the whole, 1636 lbs, and ading rough fat 17, 3 lbs. He has since killed her jag about thirteen and a half months old, th weighed, as dressed for market, 496 lbs. including rough fat, 518 lbs.

r Russell is a genileman who would not boast s agricultural exploits, nor challenge his brothrmers to surpass him ; but should you hear ny one equalling him in this particular, you doubtless make it known to us through the ineof your paper .- Greenfield pa,

leap Paint,-Mr John C. Pendegrast, painof this village, has discovered a material for ng paints, which promises to be of immense . It incorporates completely with Linsced and may be used as a substitute for that costly de. The cost of the new material is compary triffing, and abounds in almost every part e U. States. Paints are mixed and prepared tit, in the same manner as with linseed oil and of turpentine. The most satisfactory exments have been made. It produces a smoothd barder surface, answers for any color, and The inventnally impervious to water, s obtained a patent, and has already disposrights to several of the first establishments state. He also introduced his paint in Wilon, and had the pleasure of seeing it used : public buildings in that city .- Wayne Sen-

Seimens of the above can be seen at 109 nan Street, New York .- . Y. Farmer.

thod of accelerating the maturity of Melons. lons, a bed of pulverized charcoal two ineep. Lampadias, at Freiheng, attempted periment in 1813, and he succeeded in rimelons in a box filled with earth and not d during the cold summer of that year. trface of the charcoal attained a tempera-, noon of from 115 to 123 degrees, while ere it was only from 85 to 88 degrees,an Farmer.

I sum near the Ocean .- A writer in the Middlen entinel living seventeen miles from Long Sound, speaks from his own experience since of the benefit of using Plaster of Paris as atre, particularly in dry seasons. He finds it s an excellent purpose for flax, potatoes and He generally puts it on the same land, irmers on the greater part of this Island pay sufficient attention to the cultivation ulent crops as food for their stock, and view of supplying the New York market. Oyer Boy, April 6, 1831.

NOTICE.

A red meeting of the Massachusetts Horticul-lociety will be held at the Hall in Joy's ers, on Saturday next, at 10 o'clock.

The members who have books belonging to the are requested to return them on that date, rmity to a vote of the Society, passed on the R. L. EMMONS, Secretary. Ma 31.

The true Sugar Beet.

For sale at the New England Seed Store, 52, North Market street, Boston, 100 lbs, of the true French Sugar Beet Seed,—received this day from Paris, by the last Havre picket, via Newport. The excellence of this root for cattle, and for culin my and other purposes, is too well known to require comment.

Auso-Large and Small Lima Beans-Early Dwarf Beans—several vari ties of picking and other Cucumbers—Radishes, Lettnees, Caldages, Turnips, &c.

BROOM CORN.

Also, just received, a tew mushel of prime Broom Corn r ise! List scasoa in the vicinity of Connecticut river.

Wants a situation,

As Gardener, a married man without children, who understands the management of a garden in all its various branches-hot house, green house, laying out garden ground, &c.

A few lines will be thankfully attended to at this office. June 1.

Sheep - Sheep.

Valuable Books on the best method of forming good flocks, of increasing them, and treating them properly when in health and when diseased—on the character and value of Merino Sheep-anatomical structure, &c, &c-5 valuable works, viz:

Su George Stewart Makenzie, Bart, Robert R Livingston, LL. D.

Samuel Bard, M. D.

M. Daubenton, a man of letters, and profound Naturalist; his work was published in Germany, Italy, Spaio, and America-and in France, at the expense of the na-

Mr Tessiu, inspector of the Rambouillet Establishment- nd others in France.

Also for sale-a valuable co'l ction of Books on Agriculture, Manures, various treatises on Horses, Cattle, Bateny, &c, &c. By R. P. & C WILLIAMS, wholesale and retail Booksellers and Stationers, No. 18 and 29 Cornhill, Boston.

Library of Entertaining Knowledge. Under the drection of the Society for the Diffusion of Useful Knowledge

Now publishing by LILLY & WAIT, (late Wells & Lilly.) rear of Boylston market, and by Carten, Hen-DEE & BABCOCK, Washington street, Boston.

The parts of this interesting work which treat upon Timber Trees, and on Fruits, give much useful and cuious information on these subjects, and are valuable to Is consists in spreading under and around the farmer not only for the facts, that are collected with great research and julgment, but for the interesting manner to which they are combined and narrated-leading the old and the young to regard their daily occupation, not alone as a laborious means of gaining a livelihood, but as an aniusement, and a science.

The parts upon Insect Architecture and Transformation will prove unusually interesting .- Interesting to all; but to the Agriculturist particularly useful, in enabling him to understand the origin and the character of such insects as may be made subservient to the uses of man, as well as of that numerous tribe that often blight the expected harvest, and nip his promised fruits in the green tree and in the bud.

There is searcely a subject already treated upon, or that has been announced in this beautiful series, that is not calculated to prove interesting to the farmer. the farmer alone, but the mechanic, and the scholar, will fing it in the highest degree useful and interesting. It is a treasure to the man of science, without proving a stumbling-block to the unlearned.

Each part contains more than 200 pages, and numerous engravings on wood; beautifully executed. - Price orty cents a part, and continued on the s me terms. Societies for the diffusion of useful knowledge, schools

and seminaries, supplied on the most favorable terms. IFT welve numbers of the American edition are now published, and several others which are equally beautiful and interesting, now in press, and will appear in

Yellow Locust Seed.

Just received and for sile at the Seed Store connected with the New England Farmer Office, No. 52 North Market Street,

A few lbs. genuine Yellow Locust Secd, (Robinia nscudoucocia) saved near Harrisburg, Pa. expressly for this Establishment. The excellence of this tree for ship timber and fences, its rapid growth, and its beneficial of- Lambs in great demand, and being \$2 a 2 50 per head.

Wrought-Iron Ploughs .- Bar-Iron, &c.

Wrought-fron Ploughs, of a Isizes .- . Also, A Complete assortment of American, English, Swedes and Russia Bar Iron—American Braziers' Rods—Spike and Nail Rods, Shoe-Shapes-Hoop and Band Iron-Steel of all kinds-Pipe-box and Mould-board plates, &c. constantly for sale by GAV & BIRD,

No 41, India Street, Boston.

Hm. F. Otis & Co.

No. 110, Faneuil Hall Market, have a good supply of Carnation Pink roots, Pine Apples, and fine West India Squashes, from Trinidad de Cuba, May 18.

Potatoes for Seed.

For sale at the New England Seed Store, No. 52 North Market Street-

A few bushels of the fine seedling potatoes mentioned by the editor of the New England Farmer, vol. viii, p. 102. This is but the fifth year from the ball; they have twice taken the premium from the Essex Agricultural Society. (See Colonel Pickering's Report, N. E. Farmer, vol. vi. page 93) They are represented by the person who raised them, as tolerably early, more than middling bearers, remarkably delicate and mealy, size nearly round, color white, and have but very few protubecauces. A good opportunity now offers to farmers to secure a superior variety of this important vegetable for seed. Price \$1 per bushel.

Bones Wanted.

Shin and Leg Eones constantly purchased by GEO. H. GRAY & CO. No. 68 Kilby street. April 20. 2mos

Bres in Cities.

AN ESSAY on the practicability of cultivating the Honey Bee, in maritime fowns and Cities, as a source of Domestic Economy and Profit. By Jerome V. C. Smith, M. D. Just published by Perkins & Marvin, 11 t, Washington Street, and for sale by J. B. Russell, at the Agricultural Warehouse, No. 52 North Market street, price 38 cents

For Sale, Full blood Aldnerney and Short Horn Bull and Heifer Calves.

Two Alderney Ball Calves, and one Heif r Calf. Also, one Bull and two Heifer Calves of the Short Forn or Treswater breed, all from full blood imported stock, on both sides. For terms apply at this office. 4t May 11.

Lead Pipe.

LEAD PIPE, all sizes, constantly for sale by Lincoln FEARING & Co, No. 110, State Street. April 13, 1831.

BRIGHTON MARKET-Monday, May 30.

[Reported for the Chronicle and Patriot.]

At Market this day 304 Beef Cattle, 10 pair Working Oven, 31 Cows and Calves, 601 Sheep and Lambs. Unsold at the close of the market about 90 Beet Cattle, exclusive of 70 which are left within a few miles of the market.

PRICES .- Beef Cattle-The extreme warm weather, and the I rge number of Cattle at market, produced a glut' Sales were slow and uneven, and at a reduction of about 50 cts. per hundred, taking all together. We shall quote from 4 75 to 5 75, extra at 6.

Working Oxen-No sales noticed.

Cows and Calves-We noticed several sales as low as \$12, al o several at about \$30, and a number at intermediate prices.

Sherp and Lombs-We noticed a number of lots, the sales of which averaged about \$2; one or two lots, quality poor, several shillings less; also extra at 2 25 a

2 33; one lot of wethers, sheared, at 2 50, one at 3 and one at 3 50. Swine-None.

New-York Cattle Market, Moy 23 .-- At Market this day from 3 to 400 Beef Cattle, several lots Sheep and Lambs, number not ascertained; a few lots Swine, and 30 to 10 Milch Cows. Demand for Beef good, nearly all sold, but prices somewhat reduced; the quantity, however, was observed to be a little inferior to those of former ales; a few lots extra, taken at 7 50, several good, at \$7. foir \$6 a 6 50, middling 5½ a 5½, and a few prime pairs at \$8 per cwt. Sheep, market fair, and all sold, extra, \$5 a 51, good 31 g 4, fair 21 a 21, and ordinary at \$11 a 2 each. fects on sandy, barren plains, where it thrives well, are Swine, quality, rather inferior, being still fattened, 4, 45 too well known to require comment.

Swine, quality, rather inferior, being still fattened, 4, 45 too well known to require comment.

MISCELLANY.

THE FALSE ONE. BV T. H BALLEY.

I knew him not, I sought him not-He was my father's guest; I gave him not one smile more kind Than those I gave the rest: He sat beside me at the board, The choice was not my own, But ob! I never heard a voice With half so sweet a tone.

And at the dance again we met— Again I was his choice-Again I heard the gentle tone Of that beguiling voice: I sought him not--he led me forth From all the fairest there, And told me he had never seen

A face he thought so fair.

Ah! wherefore did he tell me this? His praises made me vain: And, when he left me, how I longed To hear that voice again! I wondered why my old pursuits Had lost their wonted charm, And why the path was dull, unless I leaned upon his arm.

Alas! I might have guessed the cause-For what could make me shun My parent's cheerful dwelling place To wander all alone? And what could make me braid my hair, And study to improve The form that he had deigned to praise-What could it be but love ?

O's! little knew Lof the world. And less of man's career: I thought each smile was kindly meant-Each word of praise sincere : His sweet voice spoke of endless love—
I listened and believed, And little dreamed how oft before That sweet voice had deceived.

He smiles upon another now-And in the same sweet tone He breathes to her those winning words I once thought all my own; Oh! why is she so beamiful? I cannot blame his choice-Nor can I doubt she will be won By that beguiling voice.

Providential escape of Gen. Mina.—During the last ill-fated attempt of the constitutionalists upon the Spanish frontier, Mina, in order to detach the attention of the enemy from his flying friends, with two of his officers, attempted to retreat by another ronte, which, from being on horseback, they hoped to accomplish with the greater facility. They were, however, disappointed; for the woods and defiles through which they had to pass were so close and intricate, that they were at length obliged to destroy their horses; and at the moment they were about to sink under excessive fatigue, they providentially discovered a cave, in which they took shelter. The enemy having discovered the dead horses, naturally conceived from their having been recently killed, that their prey could not be very distant, they continned their search as long as daylight allowed them, hut, happily for the fugitives, fruitlessly. bloodhounds were then procured; but who will deny the rage for whiskers and mustaches is so great, the interposition of Divme Providence, when it is stated that at this moment of extreme peril two wild that ancient profession receiving now the same redeer, animals rarely if ever met with in Spain out of the royal preserves, started up, and the dogs so ardently pursued them that no efforts could draw them off.

The merciless wretches then procured torches; nipotency; and thus the fugitives escaped their oth- ing to 'h-airy nothings a local habitation and a ern ise but too ecrtain fate.

Effect of CLIMATE,-The human race is naturally the inhabitant of a warm chinate, and the paradise described as Adam's first abode, may be said still to exist over vast regions about the equator .-There the sun's influence is strong and uniform, producing a rich and warm garden, in which human beings, however ignorant of the world which they had come to inhabit, would have their necessities supplied almost by wishing. The ripe fruit is there always hanging from the branches; of clothing there is required only what moral feelings may dictate, or what may be supposed to add grace to the form; and as a shelter from the weather, a few broad leaves spread on connected reeds will complete an Indian but. The human family, in multiplying and spreading in all directions from such a centre, would find, to the east and west, only the lengthened paradise, with slightly varying features of beauty; but to the north and south, the changes of season, which make the bee of high latitudes lay up its winter store of honey, and sends migrating birds from country to country in search of warmth and food, would also rouse man's energies to protect himself. His faculties of foresight and contrivance would come into play, awakening industry, and, as to their fruits, he would soon possess the knowledge and the arts which seeme a happy existence in all climates, from equator almost to the pole. It is chiefly because man has learned to produce at will, and to control, the wonder-working principle of heat that in the rude winter, which seems the death of nature, he, and other tropical animals and plants which he protects, do not in reality perish-even as a canary bird escaped from its cage, or an infant exposed among the snowhills. By producing heat from his fire, he obtains a novel and most pleasurable sort of existence; and in the night while the dark and freezing winds are howling over his roof, he basks in the presence of his minuc sun, surrounded by his friends and all the delights of society, while in his store rooms, or in those of merchants at his command, he has the treasured delicacies of every season and clime. He soon becomes aware, too, that the dreary winter, instead of being a curse, is really in many respects a blessing, hy arousing from the apathy to which the eternal seremty of a tropical sky so much disposes. In climates where labor and ingenuity must precede enjoyment, every faculty of mind and body is invigorated; and hence the sterner climates form the perfeet man. It is in them that the arts and sciences have reached their present advancement, and that the brightest examples have appeared of intellectual and moral excellence .- Arnott's Physics.

Mostaches.-There is no civilized animal that looks respectable in Mustaches, but grimalkin. her they are quite becoming, for they suggest at horse that could be produced. It is considered unneces once ideas of use and fitness. But a man in mustaches-a human being with purrers-is an object supremely ridiculous. If they are of no use to himand of this there can be no doubt—do they add anything to his beauty? To an officer, nultury or naval, they may, but not to a citizen, not to a boy whose cheeks are hardly razorable. Young gentlemen who cultivate mustaches are like boys when first inbreechbut no one but themselves is cheated in the belief being made in advance.

[He must have been a bold fellow who indited the above, for if known, there is but little doubt that like Absalom he would fall a victim to hair. In England that the office of barber has become a sinecurecompense for thinning the hairy crops in the corners of a man's month, as they did formerly for denuding the whole face of the excresence. Shakspeare says, something about 'the more hair the less wit;' but he being as lightly bearded as a spear of wheat, and bald but the utmost exertions of feeble men are unavail- withal, is not so good authority upon this subject as ing when opposed to the all-protecting power of Om- some others, and cannot therefore be quoted as givname.']- N. Y. American.

Valuable and Cheap Land-for Sale.

The subscriber offers for sale, 14,000 acres of choix Land, situated in the town of Pinckney, county of Lew and state of New York. Some of the land is improve and under cultivation. The country is remarkably hea thy, being entirely free from the fever and ague and frothe common bilious fevers which often afflict the town upon Like Ontario, this town being 18 miles east of th lake. The soil is principally a sandy loam, much of covered with rich black month. The timber is chief Sugar Maple, Black Ash, Butternut, Beech, Elm, & The land yields first rate crops of Grass, Rye, Oats, Ba ley, Potatoes and Flax; and on some lots, good Whei and Corn may be grown. To those wishing to obtain st perior grazing farms, a fine opportunity now offers itsel The produce of pasturage and hay from an acre of th land, is very large, fully equalling if not surpassing the from the same quantity of land in any other of the Blac River townships. The land is admirably well watere there being but few lots which have not dutable runals streams upon them. The land is well adapted to Orchan ing-the Apple tree thriving very well in this count Stock of all kinds may be disposed of with the least poss ble bouble, and to the greatest advantage, the drove purchasing at the very doors of the farmers, and payir the highest cash prices for their cattle, which will readi find purchasers at all seasons of the year. Several fa mers at present residing on this town, were original from the New England States, and some of them from Massachusetts, who are in thriving circumstances. The above described land is offered for sale at the very lo price of from two dollars and a half to three dollars p acre, for the uncleared land, and from three dollars and half to five dollars and a half for the improved lots. The land will be sold in lots to suit purchasers, and from tw to five years' credit for payment in annual instalment will be given. As a further convenience to purchaser the subscriber will receive in payment, Cattle, Shee Perk, Grain or Grass Seed, for which products he wallow the highest cash prices. The title to the land indisputable, and good Warranty Deeds will be given purchasers. Persons desirous of purchasing will plea to apply to the sub-criber, at Hemlerson Harbor, coun of Jefferson, State of New York, or to DAVID CANFIEL JAMES II. HENDERSON. Esq. on the town. March 9. ep16t

COMMUNICA ELONS.

FOR THE NEW ENGLAND FARMER.

THE SEASON.

MR FESSENDEN-I have just read the observaons upon the season by a Roxbury farmer; and though I feel the greatest respect for the opinion this accurate and scientific observer, I cannot t think him mistaken in attributing the earliness id promise of the present spring in Massachusetts the great depth of snow the last winter, is ng continuance on the ground, and consequert allowness of frost. I should once have concurd in this opinion; but the experience of the las: ar in Maine has satisfied me, that it is dependen other causes. The past winter was in Maine, as ell as in Mass. 'very extraordinary.' The automa d been uncommonly mild. Agricultural operans on the Kennebec, usually impeded by frost is rly as the middle or 20th Nov., need not have been spended the last year on account of frost, all 20th Dec.; and the river, the average of whose al close for the last 40 years is the 10th Det., s not finally shut up this year till the 11th Jany. There were several violent storms of rai), very little snow during the whole winter. Tere was very little sledding, only a few days at a e and in the whole not much more than a fortwht. After the middle of January, the winter ramed nearly its usual severity, the mercury asionally falling below zero; and the earth beunprotected by snow allowed the frost to pente to very unusual depth. I found it this spring I layer soil, 3 feet 4 inches below the surface, and 3 set 8 inches in gravel. Such a winter ough, ording to common opinion, to have been felk ed by a backward and unfruitful season. Pari larly as one rain was accompanied with cold, suthat the trees were so loaded with ice that my branches were broken off by its weight. S far however is this from being true, that the ng is early; and I have no recollection of a son, when every product of the earth gave st 1 promise of fruitfulness. The river opened tys before the average time, having been ebsed three months and a half. The ice was not ied out by a flood, but dissolved by the heat i he weather. I subjoin a table of the conparate forwardness of the spring for the last 6 years. 1826 1827 1828 1829 1830 1831,

as scarcely to be worth cultivating, has not only ded limestone; -Limestone gravel; - Chalk ;survived the winter, but has been most beautifully Marles; -Sea shells; -Soaper's waste; -and Gypcovered with blossoms. The hardier kinds of ther- sumry are generally productive; but the more delicate kinds seldom perfect their blossoms. This year they were covered with bloom, and two successive frosts, while they were in blossom, have not prevented the conversion of those blossoms into fruit. Pears and apples promise to be abundant. The plum is the only tree, which does not now promise a great crop. Two years since, the plum trees in this section were mostly destroyed by the winter. I lost about seven eighths of mine, and the remainder have not yet entirely recovered. That winter so f tal to the plum and injurious to many other trees and plants was a winter of deep without attempting satisfactorily to account for them, but I would ask whether we may not attribute the present early and promising spring to the circumstances; that the autumn was mild and moist, so that the buds were well formed; and not injured by alternate severe frosts and warm weather, and that the spring, though upon the whole nights, before the month of May.

Gardiner, May 20, 1831.

ONE WAY TO PROTECT CARRAGE PLANTS FROM WORMS.

MR FESSENDEN-In the months of May and June, 1830, the soil in this vicinity was infested with an unusual quantity of worms of various kinds which made great havor in gardens, corn fields, &c. I set out on a small plat of ground nearly 200 cabbage plants which were destroyed in a few days. The same ground was set a second and a third time, but with no better success than before and although hundreds if not thousands of worms were destroyed in my cabbage yard, their number appeared to increase; having only a sufficient number of plants to set in my yard once more and it being late in the season I thought of the following expedient :- after I had taken the plants to my intended cabbage yard, I cut pieces of paper from the same course of management. 6 to 8 inches long and from 2 to 3 inches wide and wound or wrapped them round the stalk of the plant leaving the roots as far as the dirt was attached to them below the paper, and shaped the top or upper part of the paper that stood out of the ground leaves of the plants; and the better to keep the paper to plants. Mild lime, (as chalk, or quick-lime in shape, wound some slack twisted yarn around again impregnated with carbonic acid), chiefly oper-Finter grain, which according to common the the papers; but the paper will do well without the lates, by improving the texture of the soil, and its Ts, ought to have been destroyed by the winter, yarn by placing the soil snugly round it: this had relation to absorption. r suffered less, or looked more promising in the desired effect and entirely protected the whole; . Neither did the grass suffer from its expos- my crop of cabbages was abundant, and found a lime-stone is almost perfectly pure, as is the case to the cold; but there is a prospect of an un-ready market. This plan holds good to other with marble, which frequently contains scarcely lly heavy erop. CALCAREOUS MANURES.

This class of manures comprehends a number The peach tree, which is so frequently killed, of articles, as, Burnt or calcined limestone;-Poun-

1. Advantages of Lime .- Though there are exceptions to the rule, yet in general, it may be confidently asserted, that unless where a soil has by nature, enough of calcarous matter in its composition, for the purposes of vegetation, it can neither be brought into its most fertile state, nor will other manures be so useful as they ought, if lime, or some other calcareous earth, be not previously applied. By lime spread upon a moory soil, good herbage is produced where nothing but heath, and unpalatable grasses grew before. By the same means, grass-lands, instead of yielding nothing but but bent, and other inferior grasses, have been snows, which continued late. I submit these facts covered with those of a more valuable description. The utility of lime to turnips is so great, that though in the same field, where no lime had been applied the crop died away, yet in the limed part, the turnips flourished with unabated vigor. On the Mendip lands in Somerset, by the application of lime, the value of land was raised, from 4s. to 30, per acre; and dung, which previous to liming forward, did not have very hot days or very cold had no sensible effect, operated after its application, as on other lands. Macclesfield forest in Cheshire, and vast tracts in the northern and more elevated parts of Derhyshire, and adjacent districts, have been astonishingly improved by the same means. The rye lands of Herefordshire, in 1636 refused to produce wheat, peas, or vetches; but since the introduction of lime, they have been so fertilized, as to be succes, fully applied to the growth of every species of corn. In maiden soils of a tolerable quality, the richest manure will not enable them to bring any crops, but those of oats or rye, to maturity; whereas if they receive a sufficient quantity of lime, crops of peas, badev, or wheat, may be raised to advantage. The benefit resulting from the use of lime, has been indisontably proved in the same farm, for the richer pars that were left unlimed, were uniformly inferior in produce, to the poorer that had been limed, during a period of not less than twentyone years, under

2. The principles on which lime operates as a manure.-Quick-lime in powder, or dissolved in water, is injurious to plants; hence grass, watered with lime water, is destroyed. But lime freshly burnt, or slacked, forms a compost with vegetable in the form of a tunnel, to give room for the top or matter, which is soluble in water, and nutritive

3. The various sorts of limestone. - Sometimes

quantity of these substances, is considerably di-

minished. It is necessary, therefore to analyze limestone, to ascertain the proportion of pure lime;

before it is advisable to use so expensive an article in great quantities, more especially if it must be to weak soils, to apply more than from 25 to 30 effect in producing fertility,

burnt in kilos of various constructions. It is applied with advantage to soils recently reclaimed, in a caustic state; but is generally stacked, by throwing water upon the lumps, until they erack and swell, and fall down into a fine powder. This operation, when it is to be done, should not be delayed, for if properly burnt, calcined lime is easily reduced into a fine powder, which may not be the case if the slacking be postponed. If water cannot easily be obtained, the lumps may either be divided into small heaps, and covered with earth by the moisture of which they are soon pulverized, or made into large heaps, the lumps and earth six inches thick, and the whole covered with earth, Where it can easily be had, it is a great advantage, to slack the calcined limestone for manure, with sea-water or urine. When applied to land in a powdery state, lime tends to bring any hard vegetable matter that the soil contains, into a more rapid state of decomposition and solution, so as to render it a proper food for plants.

5. Application .- Summer is the proper season for liming land. That experienced farmer, Mr Rennie of Phantassie, is of opinion, that the most profitable period for applying lime is, when the land is under summer fallow, in the months of June and July, that it may be completely mixed with the soil before the crop is sown. This is also the general practice in other districts. For a turnip crop, it should be laid on early in the spring before the turnips are drilled, in order that the lime may be thoroughly incorporated with the soil, by the ploughings and barrowings it will receive; the land will thus have time to cool, and the hine will not dry up the moisture necessary for bringing the turnips into leaf. For potatoes, lime is not to be recommended, as it is ant to burn and blister their skins. When applied to old lev, it is a good practice to spread it on the surface, previously to the land being broken up, by which it is fixed firmly on the sward. One year has been found of use, but when done three years before, it had produced still greater advantages; in the former case, the increase of oats, being only at the rate of 6 to 1, and in the latter, that of 10 to I of the seed sown. The quantity applied must vary according to the soil. From 240 to 300 bushels, of unslacked lime, may be applied on strong lands: with advantage. Even 600 bushels have been laid on at once on strong clays with great success. On light sors, a much smaller quantity will answer, say from 150 to 200 bushels, but these small doses ought to be more frequently repeated. When applied on the surface of bogs or moors, the quantity used is very considerable, and the more that is laid on the greater improvement. The real quantity, however, of calcareous matter used, debends upon the quality of the stone. It often happens, that five chaldrons do not furnish more effeetire manure than three, because they do not con- brought us to this conclusion, but I take the liberty find which has drained from a manure heap. tain three fifths of calcareous matter.

ed themselves to an expense, at the rate of ten has had the experience of my neighbors for the conveyed from a distance. Bituminous limestone shillings per acre per annum, for the lime they last three or four years, and I believe without a makes good manner. But the magnesian is the used, and have been amply remunerated. The single instance of failure so far as I have ascerspecies which requires the greatest attention, benefit, derived in the cultivation of green crops is tained the fact; it is as follows: to a half bushel Limestone sometimes contains from 20.3 to 23.5 sufficient for that purpose. Such crops may be of seed corn take one pint of tar, more or less; let of magnesia, in which case it would be injurious raised by large quantities of dung; but where cal- it be warmed over a moderate fire until it will carcons substances are applied, it is proved by long r in freely; then put it into the corn, at the same bushels per statute acre, though in rich soils, dou-experience, that a less quantity of animal and time stirring it up until it be all coated over with ble that quantity may be used, and still more with vegetable manure will answer the purpose. This the tar; you may then add ground plaster of paris, peat, on which soil it would have a most powerful is making the farm-yard dung go faither, with more or wood ashes (as is most convenient, either will powerful, and more permanent effects; and, from answer,) and stir it until the kernels will separate, 4. Mode of preparing it for use. - Limestone is the weightier crops thus raised, the quantity of ma- and will not adhere to your fingers; you may nure on a farm, will be most materially augmented, Indeed, upon land in a proper state for calcareous icice, when planting. The first impression from application, (as old ley), line is much superior to the appearance of the seed after it has gone through dung. Its effects continue for a longer period, the foregoing process is, that it will not vegetate. while the crops produced are of a superior quality, and less susceptible of injury, from the excesses of drought and moisture. The ground like wise, more especially if it be of a strong nature is much more easily wrought; and, in some in stances, the saving of labor alone, would be sufficient to induce a farmer to lime his land, were no greater benefit derived from the application, than the opportunity thereby gained, of working it in dition to this, the corn has never been infested by a more perfect manner.

> 7. Rules for the management of lime .- 1. It is necessary to ascertain the quality of the soil to which lime is proposed to be applied; and whether it has formerly been limed; and to what extent. In general it may be observed, that strong loams and stubborn clays, require a full dose to bring them into action, as such soils are capable of absorbing a great quantity of calcareous matter. Lighter soils, however, require less lime to stimulate them; and may be injured, by administering a quantity of lime, recently calcined, that would prove moderately beneficial to those of a heavy nature. 2. As the effects of lime greatly depend on its intimate admixture with the surface soils, it is expedient to have it in a powdered state before it is applied, and the drier and the more perfectly powdered, the better. 3. Lime having a tendency to sink in the soil, it cannot be ploughed in with too shallow a furrow or kept too near the surface. 4. Lime ought not how to increase the productiveness of trees to be applied, a second-time, to weak or poor soils, unless mixed with a compost; after which the land should be immediately laid down to grass.

FOR THE NEW ENGLAND FARMER.

PREPARATION OF SEED CORN.

MR FESSENDEN-I have noticed sundry communications, upon the best method of preparing ing trees of this kind fruitful by digging them up. seed corn for planting, with a view to prevent and replacing them with fresh mould in the same crows from pulling up the corn, &c. Much has situation. The too great luxuriance of growth is been said about soaking the seed in copperas wa-checked, and a disposition to bear is brought on. ter and it would seem that the question was now. The same observation was made by Mr Lawrence. settled by general consent, that this mode is the So if beans, which are but a few inches high, be only safe preventive in the car, but my own and transplanted, they do not become so tall, but my neighbors experience has brought us to a dif- they flower and ripen sooner. The same occurs ferent conclusion. We were in the habit of using infrequently transplanting broccoli; the plant does the copperas water for several years, and at first not grow so tall, but has earlier flowers, and in-(as is the case many times with new experiments) greater numbers. It is probable says Dr Darwin, we were disposed to believe that it had the desired that confining the roots of cucumbers and melons effect, but upon further experiment we found that in small garden pots would stop the too luxuriant the crows made the same depredations upon the growth of the vines, and make them more fruitful, seed soaked with copperas, as with that which if care was taken to supply them with water more had no preparation before planting. I could if frequently, and with sufficient nutriment, by mixnecessary cite sundry careful experiments which lag with the water some of the carbonic black

6. Effects of lime. - Many farmers have subject- to state the result of another experiment which handle it when cooled without the least inconvenbut three or four years of actual experience among farmers who raise from two to five hundred bushels of indian corn each, annually, has settled that question beyond a doubt,-and the crows never have pulled up more than two or three hills in ary one field, and have never carried even that away, but have left the field instantly, without ever remrning to renew the experiment, -and in adthe wire worm, which has been many times very destructive to the crop, nor has any other animal or leptile been yet found who was fond of making a meal of tarred corn,

I confess when this mode was first proposed I was very faithless; I doubted whether seed would vegetate, and if it did I had my doubts whether the tar would not be detrimental to the crop: but I am convinced that tar is so far from being ininrious to the crop, that I now believe that it not only guards the crop against birds and insects, but is salutary to the growth of the corn .-- If you see fit to insert the foregoing in your useful paper, (although past seed time) it may at least give time for corn growers to inquire into the truth of the facts herein stated, and I hope may result in some benefit to the community; and you will gratify one a least who inhabits the

VALLEY OF CONNECTICUT.

AND PLANTS.

Mr Knight, in his treatise on the culture of the apple and pear, p. 83, has this passage: 'In the garden culture of the apple, where trees are retained as dwarfs or espaliers the more vigorously growing kinds are often rendered unproductive by the excessive though necessary use of the pruning knife. I have always succeeded in mak-

Morticulture.

Society at the second quarterly meeting, held at

Report made by H. A. S. DEARBORN, President of the Society. A few weeks since, Gideon B. Smith, Esq., ditor of the American Farmer, published in ent of rural economy, throughout the Union, by g letter accompanied the package.

Baltimore, May 24, 1831.

DEAR SIR-By the brig Chatham, I send to ur address, for the Massachusetts Horticultural eiety, a small package containing as follows,

One paper Lenoir Grape seed.

One do Herbemont's Madeira do.

One mixed Grape seed, viz. Bland's Madeira, Isabella, and Herbemont's Arena; and

One do of Chenopodium Quinoa seed.

The Grape seeds were sent to me by that exlent horticulturist, N. Herbemont, Esq. of Colibia, S. C. and the object expected to be attainby their distribution and planting, is the protion of new and valuable varieties of grapes, able of withstanding the rigidity of our various

The Chenopodium Quinoa was received from Bu by J. S. Skinner, Esq. from Lieut, Fitzhugh he U. S. Navy; an account of this grain will be id in the 10th number, vol. 13, of the Ameri-Farmer. It is presented to the Massachusetts I ticultural Society in the name of J. S. Skinwho requests their acceptance of it. If we eed in cultivating this grain, it will be one of most important additions to our agricultural r ucts ever made in any country.

am, respectfully yours,

GIDEON B. SMITH.

S. Since writing the above, the Quinoa has tated and grows rapidly. Planted on Friday, 3 May, come up Friday, 20th, and on Sunday, 2 many plants had their second leaf formed.

at from the American Farmer, on the character and culture of Quinoa.

UINOA .- The letter below from Lieutenant rugh of the United States navy, accompanied equinoa, the receipt of which we noticed last and together with the subjoined direction her by Mr Skinner, to whom the quinoa was from Peru.

speaks of quinoa being peculiar to the province of Quito, and as deserving of being ranked as receedings of the Massachusetts Horticultural one of the most palatable foods. These anthorities, supported as they are by the name, by which the Hall of the Institution on the 4th of June, the seed in question is called by the natives and residents of Peru at the present time, sufficiently establish the fact that it is the chenopodium oninoa. of botanists. There are a great many varieties of Chenopodium, several of which are very common, altimore, presented the Society, a number of the (mere weeds) and the whole genus is called roosebers of the Aracacka; another citizen of that foot, in England-for instance, English mercury, ty has evinced his laudable zeal for the advance-supright goosefoot, purple goosefoot, &c. Several of the species are indigenous to the United States, donation of the seed of the Cheropodium Quinoa viz. the anthelminticum or worm seed, the spear d seeds of several varieties of grapes. The follow-leafed, the bearded, &c. But the quinoa, the one particularly under notice, is the only one of the genus that is indigenous to Peru.

It is annual, grows three feet high, flowers in July, flowers green, propagated by seed, in common earth. The seed are circular, flat, one twelfth of an inch in diameter, white, and easily pulverised, It belongs to the 5th class, Pentandria, and 2nd cloth, of a texture not sufficiently coarse to allow order, Digynia.

The quinoa is cooked and used like common rice and hence the name sometimes given it of Perurian rice. Capt. Dungan, in whose vessel the seeds were sent, politely presented the Editor with some of the prepared seed for his table. It seems that the quinoa is scalded or part boiled, before it is disposed of by the cultivator, whether for the purpo-e of its better preservation or to prevent its cultivation in other countries we know not; and to this fact is probably to be attributed the failure of all previous attempts to cultivate it. Having eaten of the quinoa, prepared in several ways, we are of course enabled to speak of its qualities from experience. Gentlemen who have eaten it in Peru speak of it in the highest terms of praise. We are not willing to go so far, though it may improve with us upon further acquaintance. It is certainly of a very pleasant flavor, but that is peculiarunlike that of common rice, and resembling that of oatmeal. Its appearance when served up is singular. The grain is principally composed of a germ, or sprout of the young plant, closely coiled. and surrounded with farina. In boiling, this spiral germ is detached, and the dish presents the appearance of being full of skippers, something similar to a dish of boiled beans. Our present impression is, that though it may attain an equal place with rice, it never can supersede that excellent vegetable on our tables,

The Editor of the Farmer has planted a quart of the seed of the quinoa, and taken such measures and resorted to such means to insure its growth as he supposes will be successful so far as soil and cultivation are concerned. He is not r iltivating the quinoa from the same gentleman, however, very sanguine in his expectations. The speen politely furnished for publication in the climate of Peru is very different from ours, the former being very temperate and subject to no change of the seasons; therefore, we have our extremely e have examined all the publications in which hot and dry weather, and the comparative shortould hope to get any information on the sub- ness of our seasons, as obstacles to success in the of the quinoa, and have satisfied ourselves on culture of the quinoa. And yet it is very possible abject of its botanical character. In Peru it that it will withstand all this, and if so, it will be an led quinua, pronounced keen-wa, with the last important agricultural acquisition. It will be obble very slightly accented. Humboldt speaks served, that the subjoined directions say it is to e chenopodium quinoa as being one of the be sown at the same season and gathered at the Mr Davenport of Milton. plants cultivated in the highest and coldest same time as wheat. It should however be res of the Andes and Mexican Cordilleras; collected that there is no winter in Peru, and of the chenopodium quinoa. Don Ulloa also sown in the spring and gathered in the fall, for it by them from Scotland,

is not believed that it can bear our winters like

U. S. S. St Louis, Callan Roads, ? Jan. 31, 1831

Dear Sir-I have at length the pleasure of sending you by the James Beacham, two bottles of Quinar, which after much inquiry and research, on the part of my friend Mr McCall, of Lima, has come forth, it was obtained two hundred unles from this. Inclosed you will receive a description of its cultivation, curing, and preparation for culinary purposes.

Truly yours, AND. FITZHUGH.

Description of the Manner of Sowing in Peru the Grain known under the name of ' Quinua.

It should be sown in soil and climate not of too cold a temperature for wheat, neither should it be what would be called warm. It is sown at the same season and gathered at the same time as wheat, The ground is prepared in furrows, twice ploughed with Peruvian ploughs, (which are nothing more than wooden knees pointed at the end,) and the seed is sown, scattered as wheat. When ripe, (to save waste, as the grain shells off very easily) it is cut carefully and gathered in on folds of cotton or linen the grain to pass through. The grain is separated from the stalk by merely rubbing it between two folds of cotton or linen cloth, and the chaff is afterwards winnowed from it.

Besides being cultivated as a cereal plant, for the grain, it is valuable as a green culinary vegetable, the leaves being caten in Peru, as a substitute for spinach and sorrel.

Resolved, that the thanks of the Society be presented to J. S. Skinner, Esq. for his donation of Quinoa and Grape seeds.

The President having stated what measures had been taken by the Committee, which was appointed last autumn, to take into consideration, the expediency of establishing a Horticultural Garden of Experiment and a Rural Cemetery, offered the following resolution, which was adopted.

Resolved, that the Committee on an Experimental Garden and a Cemetery, be authorized to increase their number, and to ask the aid of such other gentlemen, not members of the Society, as in their opinion will forward the objects desired. by being associated with them.

The following Committee was appointed to nominate a gentleman to deliver the next anniversary Address, and to report at the adjourned meeting of the Society.

Z. Cook, Jr. G. W. BRIMMER, Committee. G. W. PRATT,

William Curtis of Newton was elected a member; Dr Thaddeus M. Harris of Dorchester, a corresponding member.

Adjourned to Saturday next, 10 o'clock,

Messrs Winships exhibited a beautiful bouquet of Scotch Roses comprising fiftyfive varieties, of great fragrance and delicate colors .- Elegant bouquets of Roses, Geraniums, Native Wild Flowers, Cactus, &c, were exhibited by Gen. Dearborn, Mr Hovey of Cambridgeport, Mr Haggerston, and Mr Russell of Cambridge .- Mr Phipps of Charlestown exhibited a fine collection of Moss Roses, that excited universal admiration.

Early Peas and Mushrooms were exhibited by

Seeds of the Studiev Carrot were presented by Messrs Thorburn and Sons of New York for disays that when the old historians use the ex- course no fall sowing of wheat to withstand its tribution. This is a valuable variety of this root, on small Peruvian rice (arros pequeno,) they rigors. If it succeeds with us at all it must be suitable for field culture for cattle, and introduced

Extract from an address delivered at Northampton before the Hampshire, Franklin and Hampden Agricultural Society, Oct. 27, 1530, by Hon. Samuel C. Allen.

MORTGAGES.

There is another subject connected with the general doctrine and purposes of my discourse, which I am bound to bring to your consideration. I refer to the extent in which real estates among us are passing under mortgages. And what adds to the cause of alarm is, that most of them are made to corporations which never die, and are subject to the control of a few men, and nobody knows who they will be. There is already vested in that way an amount of capital, which is bringing the yeomanry of the country into a state of dependence and peril .- If the evil was confined to the owners of the mortgaged estates, great as it would then be, it would pass off, without deeply affecting the springs of the general prosperity. But it subjects the whole landed interest to the dominion of a moneyed capital, and exposes it to all the sudden pressures arising from fluctuations in the currency,not exactly a solid one in this country,-and from great speculations in trade. It reduces the price of real estate generally, and diminishes the resources of those who farm it, and of the towns wherein it lies and detracts from their ability to meet the burdens imposed upon them. It takes from the farmer the clear income which springs from the land, and deprives him of his natural reward for the skill he has acquired in his business.

Every state has its chief interest in its soil. It is this which constitutes it, a state. Capital may be here today, and elsewhere tomorrow. It belongs to no country. It is an instrument of gratification, or gain, and can be employed with equal facility in one place as another. And there is no moral tie that binds it. It is a power which has sprung up and increased in the progress of society, and is swallowing up all the land in the country, and bringing in a new sort of aristocracy, of a more uncompromising character than the fendal, or any landed aristocracy, ever can be .- Does not this state of things call for some protection for real estate? What I suggest is no new thing. Our ancestors brought this policy with them. Our own legislation, from the first settlement of the country had maintained it till the statute anthorising the sale of equities of redemption was introduced into our law. This fatal act has, in effect, changed our policy on this head; and by the increase of mortgages is exposing the whole real estate to be knocked off under the hammer of the auctioneer. It has caused the ruin of many furmers whose real estates have been sacrificed by such sales. Why not restore at least the old law, and bring back apprisal?

TAXES.

In regard to taxes, it is not right that the mortgager should pay the whole tax upon the estate. It is making him pay for property which he does not own, and is palpably unjust. The estate must be taxed in the town where it lies; let the mortgagee be taxed for the amount of his lien upon it. and the mortgagor for the residue. There would be strict justice in this, as regards both the town and the mortgager, and there is not the least difficulty in carrying it into effect by legislation.

INTEREST.

There might be also a reduction of the rate of interest on debts secured by mortgage. Why is interest paid for money at all? It is on account of Notwithstanding all the injuries thence sustained.

risk on the part of the lender. In the manner in remove weeds in an effectual manner? This negliwhich debts are now secured by mortgage there gence is the more to be blamed, because, were is scarcely the shadow of risk, and why should a debtor, who gives such security, pay for a risk when there is none? The United States can borrow at four per cent, and why should mortgagors give more? It is as much as the income of real estatewill admit. And is there not just ground for a difference between the rate of interest on debts secured by mortgage and debts resting on personal security only? Such a provision would afford great relief to the farmer, and in its effect would also benefit the manufacturer and the trader. These are subjects of great interest, and they are forced upon our consideration by the circumstances of the times.

CREDIT.

I had intended to say something on the subject of credit. The facility with which this is obtained proves the ruin of one half of mankind. It is a snare and a trap to the young. To the young man, his strength is property and a resource for future years, and he should never contract a lien upon it to any one. There was a practice among the ancient nations, of mortgaging the person's body as security for the loan. Credit in its mildest form is little better than this. It is in fact, to him whose only resource is his labor, a mortgage upon his physical strength and his liberty. There is a great difference, it is true, between a debt contracted for property which is kept and yields and consumed.

Credit perhaps cannot altogether be dispensed with, but it is a grave question, whether, on the whole, it has not done more mischief than good, There is hardly an evil in society which is not sprung from it. It has created a race of non-producers, who render no equivalent to society for what they consume. It has separated knowledge from labor and deprived the laborer of the improvements which his faculties require, and of the satisfaction for which his nature was designed. It has oppressed industry and worth on the one hand and pampered idleness and profligacy on the other. If every young man, who should from this time come of age, would contract no debt, what would be the state of society in 20 years? It would be changed in its whole condition and character.

ADVANTAGES TO BE DERIVED FROM THE DESTRUCTION OF WEEDS,

Plants that grow naturally, among a crop that has been sown, may be regarded as weeds, or, in other words, as enemies to the crop that is cultivated. The destruction of weeds, therefore, must be considered as one of the most important branches of the agricultural art; for if it be neglected, or even the poor. if slovenly performed, one third, or one half of a fair crop, may only be obtained, even from the very best soils. Besides, it merits consideration that if weeds are suffered to exist, the full advantages of manuring land, and many other improvements, can only be but partially reaped. Nor is this all; the mixture of weeds in the soil, prevents the crop from receiving the beneficial influence of the air :- augments the risks at harvest, (for a crop that is clean, may be ready for the stack-yard in from that misance, as China or Japan; and the much less time than is required to harvest it, when farmers would soon find, that however anxious they encumbered with weeds); - and the seeds of these may be, to have their lands tithe-free, yet to have intruders, deteriorate the quality of the grain them weed free, is of still greater importance.

the benefit, of the use to the borrower, and for the how many are there, who hardly ever attempt to farmers at the trouble of collecting all sorts of weeds, before they have formed their seeds and of mixing them with rich earth, they would soon be reduced into a soft pulpy mass, and in this way a pernicions muisance might be converted into a valuable manure.

Various experiments have been tried, to ascertain the positive advantage derived from carefully weeding one part of a field, and leaving another part undone; among these, the following, made with peculiar accuracy, may be safely relied on.

- 1. Wheat,-Seven acres of light gravelly land were fallowed, and sown broad-cast; one acre was measured off, and not a weed was pulled out of it; the other six were carefully weeded. The unweeded acre produced 18 bushels; the six weeded acres, 135 bushe's, or 224 per acre, which is 41 bushels, or 1 more produce in favor of weeding.
- 2. Barley .- A six acre field was own with harley, in fine tilth, and well manured. The weeding, owing to a great abundance of charlock, cost 12s. per acre. The produce of an unweeded acre was only 13 bushels; of the weeded, 28. Difference in favor of weeding, 15 bushels per acre. besides the land being so much cleaner for succeeding crops.
- 3. Oats .- Six acres sown with oats; one acre ploughed but once, and unmanured, produce only 17 bushels. Another six acres ploughed three an income to the purchaser, and that which is spent times, manured, and weeded, produced 37 bushels per acre. This experiment proves, that oats require good management, and will pay for it as well as other crops. Ten bushels of the increased produce may be fairly attributed to the weeding; and the other ten to the manure.

The importance of weeding, both to the individual and to the public is such, that it ought to be enforced by law. At any rate, a regulation of polire, for fining those who harbor weeds, the seeds of which may be blown into their neighbor's ground, can have no injustice in principle. In England, the petty constable might be required, by precept from the high constable, to give in presentments to the Quarter Sessions, containing a list of all persons who suffered weeds to run to seed in their bedges or lands, such presentments to be particularly specified to the court. Those referring to the coltsfoot, to be given in at the Ladyday sessions; and those referring to thistles, ragweed, &c, to be given in at the Midsummer sessions. An order of court might then be made, for the immediate removal of such nuisances, and if not complied with, the offender should be fined a sum not exceeding five pounds, one half to the informer, and the other half to go for the relief of

If, in consequence of such a system being enforced, 44 bushels of wheat ;-15 do. of barley ;-10 do. of oats additional, were raised in all the fields in the kingdom, whose crops are injured by weeds, what benefits might not be the result?-Indeed if such a plan were to take place, and if the overseers were compelled, by an express statute, to employ the poor, in the destruction of weeds, England might, in process of time, become as free

On the whole, keeping his land in a clean state,

enduct. The regulations, therefore, which have en suggested, may be considered as both expeditand necessary; for were they adopted, it is eviat, that many of the evils alluded to would be moved, and the wealth and agricultural resours of the nation, materially augmented. - Sinclair's Ade of Agriculture.

From the New York Farmer.

MANGEL WURTZEL AND RUTA BAGA. The committee of the Massachusetts Agriculisideration that our stock is fed on preserved der for about six months in the year, the imporce of such a crop as food for eattle, cannot be too I hly estimated by the farmer. I agree with y, Mr Editor, that many farmers, by no means low sound sense, nor regard the voice of nature en they confine their stock throughout almost the ole winter on dry hard fodder. In almost every t of Long Island, I have known farmers to feed to their milch cows, winter after winter, nothing salt hay and bottom cornstalks; and in the somer, to confine them to pasture without a sihparticle of salt during the whole grazing sea-Such treatment cannot be otherwise than judicial to the health and the development of desirable properties of a milch cow. The ctice of giving succulent food to cows and sheep nore common now than a few years past, The ention of agriculturists in most parts of the and, is confined to potatoes and turnips. It is : impression among us, that mangel wurtzel, subeets, parsnips and carrots require more labor Lare attended with greater expense than potas, turnips, corn, and English hay. But the above nmittee say that 'no climate is better adapted tin ours, for mangel wurtzel, sugar beets, (the ist nutritions of the two, and equally productive) a baga, common turnips, carrots, parsnips and tatoes-and of all these, cattle are very fond, d most if not all of them, form the most wholene food of sheep and swine, 'We have nerally, it is believed, had the idea that much ore labor and skill are necessary in cultivating ingel wurtzel, sugar beets, and ruta baga, than for rn and potatoes. This notion is natural enough. cause we have attended to their culture much ore than the former. But we have in this report, we had in the report of the last year, the testiony of a practical and nice observer, the Rev. r Colman, who, in speaking this year of the ta baga, says ;- the whole from the sowing to a gathering, was not two thirds of the labor usually stowed in planting, cultivating, and gathering an re of potatoes.'

Mr Foster's ground was manured with about ght cords of compost manure, and ploughed in tht inches deep. The seed was sown about the th of May, in rows, twentytwo inches apart. ne soil was kept mellow and free from weeds. tions for the next winter's provision for their live put in the milk.

ght to be a principal object with every farmer; stock. Let every Long Island farmer have a good d if this be not carefully attended to, he may supply of succulent food—and let this be indiciously st assured of paying dearly for his neglect. But given out in connexion with his salt hav, cut straw losses which be suffers, do not remedy the in- and corn-stalks. This done, an increased quantity y which the public sustains from his slovenly of milk, and an improved appearance in milch cows, will be the consequence,

By the same report, I perceive the Rev. Henry Colman obtained the premium of \$20 for his fine crop of ruta baga. Allowing 56 lbs, to the bushel he had 903 busnels to the acre. On the supposition that the whole expense of this crop, was not greater than would be the culture of an acre of wheat, the advantages are easily perceived. Ruta baga usually sell in New York, from 19 to 44 cents the bushel. Allowing 20 cents, the above crop differ in several other respects. To institute a fair would amount to \$180 60. The land on Long 1st- comparison, we must deduct from Massachusetts al Society for 1830, awarded the premium of and does not generally produce over 25 bushels per the following items. 0 for Mangel Wurtzel, to Mr Gideon Foster, of acre—anounting at \$1 20 to \$30 00. The land on Fo arlestown. By measurement Mr F. had 1413 this Island, well manured and the crop well tilled, shels to the acre; and by weight, allowing 56 lbs. will yield equal to that of Massachusetts, 1 am the bushel, he had 1512 bushels, or 86,455 lbs. fully of the opinion that the farmers on the greater wards of fortythree tous. When it is taken into part of this Island do not pay sufficient attention to the cultivation of succulent crops as food for their stock, and with a view of supplying the New York

CIDER.

The rules on which making good sugar depends, are careful straining and cleanliness. With equal propriety it may be said, that good cider depends on the observance of the same rules-the juice carefully strained from the pulp. It has long been our spinion that too much carbonic acid is suffered to escape during fermentation producing either too much alcoholer acetic acid. We perceive some of the best cider makers recommend the prevention of the escape of carbonic acid gas by laying light substances, such as cloths or leaves on the bung hole, while the liquid is under fermentation.

Paint for Garden Fences, Out Louses, Eaves Troughs, &c .- Melt over a slow fire in an iron pot or kettle, two lbs. of rosin and one lb. of roll brimstone; when perfectly liquefied, add slowly three gallons of train or fish oil, and when perfectly incorporated, add Spanish brown, Venetian red, vellow other, or any other dark color, till of sufficient consistency to cover wood of a uniform color : use it warm with a brush , and when dry give it a second coat, and you will have a paint that weather is incapable of affecting. It takes longer to dry than common paints, but if rightly managed usually becomes hard in five or six days .- Genesee Furmer.

Horse Barefoot .- Many of our readers (says the New Bedford Gazette) recollect that Admiral Sir. Isaac Coffin sent four elegant horses from England to Brighton, with a view that the breed in his native state might be improved. One of those horses, Barefoot, we understand, left Providence on Sunday, the 15th inst. for New York, where he is to he shipped to England to run a race for sixty thousand dollars. Our informant, who saw him on board the steamboat at Providence, and who has seen many of the finest horses raised in this country, says Barefoot is by far the most beautiful and splendid horse he ever saw.

Chalk for Calves .- To prevent the scours in is now the season for farmers to make prepa- young calves, a little chalk is recommended to be

Expenses of the State .- We make the following extract from an article in the last Springfield Re-

The amount of expenditure for Massachusetts, is stated by the Northampton Committee to be about \$293,000; and for the other five N. E. States, \$244,000. Now if the system of expenditure is the same in all these States, the comparison is just; otherwise it is not. But the system is not the same.

None of these states provide for foreign paupers : none of them have such a system of legislation: most, if not all of them, support their judicial establishment by fees paid by those who go to Court, and not as here, out of the State Treasury. And they

or	State paupers	\$70,000
í	Agricultural Societies	5,000
4	Land agency	1,620
6	Extraordinary legislation	50,000
4	Criminal proceedings	30,290

Deduct from

135,590

\$156,910

So that the expenditures of Massachusetts, upon the system of the other New England States. would be \$135,000, which deducted from \$244,000 the expenditure of those States, leaves \$108,000, balance in our favor, instead of \$50,000, against

It was remarked by the Solicitor General at the Supreme Court in Springfield last week, that he found but one indictment in Worcester county, one in Hampshire, and three in this county : and in other parts of the State, he had found the indictments for crimes surprisingly diminished within two years. He could ascribe this change in favor of virtue and good order to no other cause than the influence of Temperance Societies and the great change in the consumption of ardent spirits,-Springfield Rep.

MORAL CHARACTER OF THE QUAKERS.

Judge Mellen, in his charge to the Grand Jury at the opening of the present term of the Court at Portland, Me. stated that in a practice of fortyfive years, in which he had been intimately acquainted with the proceedings of the judicial Courts in that part of the country, he had never known but one instance in which a member of the Society of Friends was arraigned at the bar as a criminal,

Great Natural Curiosity .- The brig Hardy, Captain Shirley, which arrived here 3d inst. from Batavia, has on board a living female Ourang Out-ANG. She has suffered much on the voyage and is very sick. She is greatly affected by cold, and keeps a blanket constantly wrapped about her. She has been visited by Dr Smith, the Quarantine Physician, who examined her, felt her pulse and ordered milk to be given to her, which occasioned a temporary revival of her spirits. She is still able to walk, although she totters from weakness. When she stands erect her hands nearly touch the ground. She eats, drinks and spits, like a human being.

This is the only successful attempt ever made, to introduce one of these remarkable animals alive into this country. Some years since, an Ourang Outang was brought into port, but died in the harbor. The skeleton has been frequently exhibited by Dr Smith, at his annual Anatomical Lecture. - Boston Tran-

NEW ENGLAND PARNER.

BOSTON, WEDNESDAY EVENING, JUNE 8, 1831.

CANKER WORM.

J. Winship, Esq. of Brighton, near Boston, a gentleman, who is well known to possess much practical as well as scientific knowledge of the culture of fruit trees has suggested to us a remedy against the cankerworm which he has himself made use of with much success. After the worm, in the latter part of spring and fore part of summer has made its lodgement among the branches and commenced its ravages on the leaves of fruit trees, it has generally been supposed that the owner of the trees had nothing to do, but to submit to an evil which it had been too late to remedy. But Mr Winship applies tar to the body of the tree at that time, according to the common mode of tarring trees, to prevent the ascent of eankerworms; and then by jarring or shaking the body and limbs of the trees, the worms fall to the ground, or let themselves down by threads, so that they may be struck off with a stick, and thus detached from the tree. They then instinctively and immediately turn towards the body of the tree, and attempt to ascend to the high places from whence they have fallen. But here the tar presents an insuperable obstacle to their further progress, and they fall back and perish for want of food.

We doubt whether it would be safe to rely altogether on this mode of destroying the insect without the customary fall and spring appliances of tar. Perhaps, however, it may supersede those troublesome and expensive processes; and at any rate, it must prove a powerful auxiliary to the old mode of attacking these depredators.

SMALL WORMS ON PEAR TREES.

A friend has entered a complaint at our office, against a small worm, which, on its first appearance resembles the maggets found in cheese, but afterwards changes to a green color, and devours the leaves of the pear tree. We submitted the case to Mr Winship, the gentleman named in the preceding article, who advises to silt or scatter wood ashes, or quick lime, or dry dust over the leaves infested when wet with dew or rain. If the insects were accommodated, by means of a syringe or garden engine, with now and then an artificial shower of soap-suds, lime-water, decoction of walnut leaves, ditto of clider leaves, or tobacco leaves or stems, we presume they would take such treatment in dudgeon, and disappear without delay or eeremony.

Silk,-The New Hampshire Statesman says that the manufacture of Silk Ribbons was attempted at Durham, N. H. about forty years ago by the late Gen. JOHN SULLIVAN of revolutionary fame .- He employed French weavers, and kept three or four looms employed about a year. The causes that led to the relinquishment of the business are not now known: probably the difficulty of procuring raw silk at that early period.

PROPERTIES OF MANURES, &cc. To the Editor of the New England Farmer.

SIR-I wish to ask, through the medium of your valuable paper, what chemical ingredients contained in manures enter into the composition of plants, and in what state manures contain the most of them? C. W.

ARMERS AND GARDENERS' WORK FOR JUNE. Melons and cucumbers, which have hithertobeen protected by glass, or by paper frames, may benefit of the sun and air. now be exposed to the epen air. If the season be tage of the practice.

Vegetables that are newly transplanted, as they have their roots more or less diminished, or other- both ways at once. wise injured, often need watering, until they have taken new roots. But this should be done with caution. If a dry season follow the transplanting let them be watered, if they appear to droop, only at evenings and in cloudy weather, and with water which has been exposed, one day at least to the shining of the sun; not with water directly from a wellor a cold spring, as it will give a chill to the plants. Only a small quantity should be applied at once; that it may have an effect similar to that of a refreshing rain; for water applied, plentifully or forcibly, or falling from a considerable height. is apt to wash away the finest of the mould from the roots, or make little cavities about them, which admit too much air.

In a dry season, whole gardens sometimes need watering; and in doing it the above precautions should be regarded. It is of very great convenience to have a piece of standing water or a brook or rivulet near at hand by which water may be furnished in sufficient abundance without a great degree of labor.

WEEDING. Sir John Sinclair observed that ' the importance of weeding is such, both to the individual and the public, that it ought to be enforced by law. At any rate a regulation of police for fining those who harbor weeds, the seeds of which may be blown into their neighbor's ground can have no injustice in principle.

Hoeing. The ends to be answered by hoeing are chiefly these :- To destroy weeds, which are always ready to spring up in every soil, to exhaust the land and starve the plants. For this purpose when the weeds have attained any size, deep hoeing becomes necessary. To prevent the soil's becoming too hard and close, so that the roots cannot extend themselves freely in search of vegetable food, nor feed on the fixed air and other fertilizing gases generated in loose and rich soils. In this case deep hoeing is necessary. But hoeing should cease entirely or be very shallow when the roots are so much extended as to be injured by hoeing. The deeper land is hoed, provided the roots are not disturbed, and too much cut in pieces, the greater advantage it will be to the plants. The oftener land is hoed the more moisture it retains, the more the crops are nourished, and the better it either with a hoe or the fingers, and fresh soil a high steep hill.

substituted, but not accumulated about the stems lest the lower roots should be deprived of the

The land is in a good degree prepared for sue at all dry your vegetables will stand in need of wa- ceeding crops by hoeing; and there is great are ter. Loudon remarks that many kitchen crops are obvious advantages in stirring the ground while lost, or produce a very inferior quality for want of the dew is on in the morning, or soon after a light watering; lettines and cabbages are often hard rain. Where land is tolerably free from obstacles and stringy; turmps and radishes do not swell, the frequent use of the horse plough to a considonions decay. &c, copious waterings in the eve- erable depth renders the labor much less seven nings, during the dry seasons, would produce that and expensive, and more advantageous to the fulness and succulency which we find in the veg- crop, than to depend on the hoc alone. The first ctables produced in the Low Countries, and in time the plough is used, turn the furrow from the the Marsh Gardens at Paris, and in England at the rows. At the next ploughing, and all after ploughbeginning and the latter end of the season. The ings, the furrows are to be turned towards the rows: vegetables brought to the London market, from this prevents the plough from injuring the roots. the Neat's Houses and other adjoining gardens. The depth should be about the same as for any where the important article of watering is much other ploughing or the intention will be in some more attended to than in private country gardens | measure defeated. This may render it necessary may be adduced as affording proofs of the advan-sometimes to go twice in the same furrow. A plough called a cultivator has been constructed, with two mouldboards, which turns the mould

The opinion entertained by some, that no horing at all should be done in a dry time, is irrational and ridiculous. They deprive their land of the benefit of the dew, suffer it to be overrun by weeds, and allow the ground to be so hard that the rain when it comes will not penetrate it. There is no soil perhaps except a thin sandy one that will not be benefited in hot dry weather by frequent hoeing."

Salad herbs may be grown at sea by sowing the seeds on thick flannel well cleaned and moistened. Put the flannel on a board which can be hung up. Place on the flaunel on which the seeds are sown another piece of flannel fastened to a thick beard. Take off the upper board as soon as the secds have vegetated, say 24 hours. In six or seven days, if good weather, the crop will be two inches high.-It is then fit for use. Be careful to keep the flamel always wet.

To have a constant succession of radishes for the table the seeds should be sowed once a fortnight from April to August. As they are uncertain in their growth, the best method is to put the seed between rows of other plants; and they are so easily pulled that they need not incommode the plants among which they grow,

Sow strong house or wood aslæs over the ground about the time the turnips are springing up, This will cause the young plants to grow sooner out of the way of insects, produce a large crop and make the turnips sweet and palatable.

Hilling Corn.-Erastus Ware of Salem, Mass. says of an excellent field of corn, which obtained a premium, that it was bood three times, but not hilled as has been customary; and upon comparison of that not hilled, after a severe gale, he is satisfied that no advantage is gained by hilling as is common. His opinion is that there is no benefit to be derived from hilling corn-and corn raised on a flat surface, when the weeds are destroyed and the ground kept loose, is by no means so likely to suffer by the drought, or to have its roots impeded withstands drought. The earth about the stems in their search after their proper nutriment, as of young plants of corn, &c, should be removed where the ground is drawn up round the stalk in 'ew Potatocs,-We were presented by Mr Pond ambridge, on Monday the 7th of June, with toes of the growth of the present season, 5 to 6 inches in circumference. The sort from Mr Russell's seed store the last spring. Potato has a great reputation in Bristol ty (where it originated) for its productiveness dayor, as well as earliness. These were rais-

the open air without forcing.

2 North Market Street, actical Treatise on the Culture of the White y Tree and the raising of Silk. Price 124 cts .nundred-a valuable agricultural tract for distriYellow Locust Seed.

Just received and for sale at the Seed Store connected with the New England Farmer Office, No. 52 North | FEARING & Co , No. 110, State Street. Market Street,

A few lbs. genuine Vellow Locust Seed, (Robinia Perkins' Early Seedling, the same that was pseudoacacia) saved near Harrisburg, Pa. expressly for this Establishment. The excellence of this tree for ship timber and fences, its rapid growth, and its beneficial effects on sandy, barren plains, where it thrives well, are oo well known to require comment.

Potaloes for Seed.

For sale at the New England Seed Store, No. 52 North Market Street-

A few bushels of the fine seedling potatoes mentioned by the editor of the New England Farmer, vol. viii, p. 102. This is but the fifth year from the ball; they have twice taken the premium from the Essex Agricultural Society. (See Colonel Pickening's Report, N. E. Farmer, vol. vi. page 98) They are represented by the person who raised them, as tolerably early, more than middling bearers, remarkably delicate and mealy, size nearly round, color white, and have but very few protubecauces. A good opportunity now offers to farmers to secure a superior variety of this important vegetable for seed. Price \$1 per bushel May 18.

Wants a situation,

As Gardener, a married man without children, who understands the management of a garden in all its various branches-hot house, green house, laying out garden ground, &c.

A few lines will be thankfully attended to at this office. June 1.

Bees in Cities.

Brass Syringes.

AN ESSAY on the practicability of cultivating the Honey Bee, in maritime Towns and Cities, as a source of Domestic Economy and Profit. By Jerome V. C. Smith, M. D. Just published by Perkins & Marvin, 114, Washington Street, and for sale by J. B. Russell, at the Agricultural Warehouse, No. 52 North Market street, price 38 cents.

> For Sale, Full blood . Hanceney and Short Horn Bull and Heifer Calves.

Two Alderney Bull Calves, and one Heif r Calf. Alpacket, via Newport. The excellence of this so, one Bull and two Heifer Calves of the Short Florn or cattle, and for culinary and other purposes, is too Teeswater breed, all from full blood imported stock, on The excellence of this so, one Bull and two Heifer Calves of the Short Forn or both sides. For terms apply at this office.

Hm. F. Otis & Co.

No. 110, Faneuil Hall Market, have a good supply of Carnation Pink roots, Pine Apples, and fine West India Squashes, from Trinidad de Cuba.

Branding Irons, at reduced prices.

Carter's improved Branding Irons, for branding Guide Boards, for sale at the Agricultural Warehouse, Nos. 51 and 52 North Market street. This is a very convenient article for country towns, as it will enable them to put up permanent guide boards at a trifling expense; it is simply by burning the brands into a piece of board, then lightly plane it over, after which give it a coat of white Guide boards made in this way are much more durable than the common boards, and the cost is trifling. The above are offered for sale at 40 to 50 per cent discount from former prices, which will enable all towns to furnish themselves with a very useful article.

> For sale at the Agricultural Warehouse, 59 NORTH MARKET STREET.

WILLIS' IMPROVED BUTTER STAMPS IN This is a simple, but elegant and useful implement, which moulds butter into a handsome rectangular, or eubic form, presses out the buttermilk; and by the same process fixes upon it a beautiful impression, which admits of being varied into such letters or figures as may best suit the fancy of the owner of the article.

Dr Thacher's Bee Hives,

For sale at the Agricultural Warehouse, No. 52, North Market street-

IMPROVED BEEHIVES, constructed on a plan invented by Dr Thacher, author of an excellent Treatise on Bees. The American Orchardist, &c. These Hives are so formed that they afford facilities for taking honey without destroying the Beest and likewise present security against the ravages of the Bee Moth, the great enemy to that useful, industrious and indispensable insect; together with other advantages, which give it a decided superiority over any other hive which has been offered for the eccommodation of persons disposed to engage in one of the most pleasing and profitable branches of rural econ-April 6.

BRIGHTON MARKET-Monday, June 6. [Reported for the Chronicle and Patriot.]

At Market this day 185 Beef Cattle, (including 82 unsold last week); 12 Cows and Calves, and 638 Sheep and Lambs. Unsold at the close of the market 63 Beel Cattle, exclusive of 105 left within a few miles of the market, all of which will make more than have been sold this day.

PRICES.—Beef Cattle—Market 'glutted;' price of Cattle reduced about 25c. from last week. We quote from 4 75 to 5 50—three or four yoke extra at 5 75.

Cows and Calves-We noticed sales at \$14, 17, 20, 23 and 25.

Sheep and Lambs-Sales quick; we noticed one lot at \$1 75, one at 2 00, and one at 2 25-a lot of fine weth-

PRICES OF VEGETABLES AT FANEUIL HALL MAR-KET.—Early Peas §1 per bushel. Strawberries 33 cts. per box. Early White Dutch Turnips 10 cts. per bunch. Cucumbers 12 cts. each. Potatoes 30 cts. per bushel. Onions 3 cts. per hunch. About 500 bushels of Early Peas were sold at Faneuil Hall Market on Monday and Tuesday last.

MISCELLANY.

SIGOURNEY, a few years since, while on a visit to Fredericksburg.

> MOTHER of him whose godlike fame The Good throughout the world revere, Ah! why without a stone or name, Thus sleep'st thou unregarded here?

Fair pensile branches o'er thee wave, And Nature decks the chosen dell, Yet, surely o'er thy hallowed grave A Nation's mournful sighs should swell.

Rome, with a burst of filial pride, The mother of her Graechi viewed; And why should we restrain the tide Of reverential gratitude?

She to sublime Volumnia paid Her tribute of enraptured tears, When the dread Chief that voice obeyed Which sternly curbed his infant years.

Thou, in the days of Sparta's might, Hadst high on her illustrious roll Been ranked amid those mations bright, Whe nobly nursed the great of soul-

For, disciplined in Wisdom's school, The lofty pupil owned thy sway, And well might he be skilled to rule, So early nurtured to obey.

No enervating arts refined, To slumber fulled his heaven-born might, No weak indulgence warped thy mind, To cloud a hero's path of light.

Say, when upon thy shielding breast, The Saviour of his Country hung, When his soft lip to thine was pressed, Wooing the accents from thy tongue-Saw'st thou prescient o'er his brow The shadowy wreaths of laurel start?

Or, when his infant hands were taught By thee in simple prayer to rise-Sav, were thy own devotions fraught With heightened incense for the skies?

Well may that realm, confiding rest, Heroes and mighty chiefs to see, Who finds its infant offspring blest, With monitors and guides like thee.

Some future age, than ours more just, With his shall blend thy honored name, And rear, exulting o'er thy dust, The monument of deathless fame-

Shall thither bid young mothers wend To bless thy spirit as they rove, And learn, while o'er thy tomb they bend, For Heaven to train the babes they love.

A late Tory Essex Member of Parliament, having at a parochial meeting made some proposals which were objected to by a sturdy farmer ; 'Sir,' said the great man, 'do you know who I am? do you know that I have sat in two parliaments; and once that it did originate in that. that I was brought up at both Universities?' Why, replied Hodge, ' that may be; I had a calf that sucked two cows; and the more he sucked the bigger calf he grew!

A rich old farmer in the north of Devon, speaking to some of his friends of the scholastic progress MOTHER OF WASHINGTON.

The following beautiful lines were written by Mrs made Dick a parson, I think, but a look'd such a and under cultivation. The country is remarkably hear good hand to holding the plough, that Iz thoft thy, being entirely free from the fever and ague and from 'twas a pity to spoil a good ploughman.'

> A gentleman on horseback finding himself at a spot where four roads met, asked a countryman who was working on one of them, where it ran to. Clodpole raising himself from his stooping posture and scratching his head replied with a grin; 'I does'nt know where it rins to, zur, we finds it here every morning.

It is a beautiful trait in the lastory of the American government that it has never shed a drop of human blood, nor banished a single individual for State erimes. No renegade minister grows immortal there by 'saving the constitution and crushing the "hydra of jacobinism," at the expense of human blood and human happiness. I am delighted to find that the more popular a government grows, the more mild it becomes; and that the glory of dispensing with the services of the hangman in political affairs, was reserved for the first government erected and conducted by the people ;-by those whom the planners of our bloody treason and sedition have chose to designate price of from two dollars and a half to three dollars pe as "ferocious rabble." '- Scotsman.

Female Fashions at Malta.-When abroad they are all arrayed in black. They put over their other dress a robe or loose shirt of that color, brought high on the bosom, and in place of bonnets their heads are covered with a black silk mantle which invests their shoulders and descends half way behind. The part which covers the head is furnished with a piece of whalebone inserted in the hem, which keeps it in position and prevents the silk from dropping over the eyes. One hand placed inside, is always necessary to hold together the sides of the scarf in front; and the other is often hid under its folds, only a fore finger being suffered to peep out through an opening left for the purpose. Of course, under such mufflers little can be seen of the beauties of form or feature, if a Maltese nymph happen to possess them: the eyes and a moving pall-black figure are all that can be distinguished. But sometimes the fair one deigns to exhibit her face to a curious gazer, in place of engrossing to herself the privilege of seeing; and features, good humored, rather pleasing than hand-some, and irradiated by a pair of fine sparkling eyes, are displayed to the beholder. The complexion is a dark olive, but partaking a little too much of a sort of mulatto tinge. The mantle is obviously borrowed, or rather it has descended from a distant age and people. It answers to the veil of Eastern ladies .-Bigelow's Malta.

An . Ipology .- When John Clerk (Lord Eldon) was at the bar, he was remarked for the sang froid with which he treated the Judges. On one occasion, a junior counsel, on hearing their lordships give judgment against his client, exclaimed that 'he was surprised at such a decision!' this was construed into contempt of court, and he was ordered to attend at the bar the next morning. Fearful of the consequences, he consulted his friend John Clerk, who told him to be perfectly at ease, for he would apologize for him in a way that would avert any unpleasant result. Accordingly when the name of the delinquent was called, John rose and coolly addressed the assembled tribunal-'I am very sorry, my lords, that my young friend has so far forgot himself as to treat your bench with disrespect; he is extremely penitent, and you will kindly ascribe his unintentional insult to his ignorance. You must see at the said he was He said he was surprised at the decision of your lordships! Now, if he had not been very ignorant of what takes place in this court every day-had he known you but half so long as I have done, he would not be surprised at anything you did.'

Valuable and Cheap Land-for Sale. The subscriber offers for sale, 14,000 acres of choice Land, situated in the town of Pinckney, county of Lew the common bilions fevers which often afflict the town upon Lake Ontario, this town being 18 miles east of the lake. The soil is principally a sandy loam, much of i covered with rich black mould. The timber is chiefly Sugar Maple, Black Ash, Butternut, Beech, Elm, &c The land yields first rate crops of Grass, Rye, Oats, Ear ley, Potatoes and Flax; and on some lots, good Whea and Corn may be grown. To those wishing to obtain su erior grazing farms, a fine opportunity now offers itself The produce of pasturage and hay from an acre of the land, is very large, fully equalling if not surpassing tha from the same quantity of land in any other of the Black River townships. The land is admirably well watered there being but few lots which have not durable running streams upon them. The land is well adapted to Orchard ing-the Apple tree thriving very well in this county Stock of all kinds may be disposed of with the least possi ble trouble, and to the greatest advantage, the drover purchasing at the very doors of the farmers, and paying the highest cash prices for their cattle, which will readily find purchasers at all seasons of the year. Several far mers at present residing on this town, were originally from the New England States, and some of them from Massachusetts, who are in thriving circumstances. The above described land is offered for sale at the very low acre, for the uncleared Land, and from three dollars and halt to five dollars and a half for the improved lots. The land will be sold in lots to suit purchasers, and from two to five years' credit for payment, in annual instalments will be given. As a further convenience to purchasers the subscriber will receive in payment, Cattle, Sheep Perk, Grain or Grass Seed, for which products he wil allow the highest cash prices. The title to the land is indisputable, and good Warranty Deeds will be given to purchasers. Persons desirous of purchasing will please to apply to the subscriber, at Henderson Harbor, county of Jefferson, State of New York, or to David Canfield JAMES II. HENDERSON. Esq. on the town. March 9.

SOUNTHILT TATEOUS.

he following is an able essay on an important topic. En. ON BREEDING FOR A DAIRY STOCK. MR Frssenden-The subject of breeding for Dairy Stock, is one of a good deal of interest this time. Inquiries are frequently made in inversation which show this to be the case. In e present state of our knowledge such questions

ttle?

2. Are there one or more breeds of cows own, by long trial, to be deep milkers?

3. To what extent is breed to be relied upon the selection of a stock for milk?

I propose to make a few suggestions by way answer to these questions.

There is another which I shall say something on in another paper with your permission,

On what else, besides breed, depends deep milk-

It is nothing new to say that the object of eding (in a technical sense,) is to perpetuate the progeny, the form, constitution, and particr qualities of one or both the parents. But at I wish to ask attention to, and to enforce in s communication, is the very important factt the longer any distinguishing quality, mark, peculiarity, can be traced back in the ancestry,

A particular cow may chance to be a fine milk-tion. but if the parents, for some generations, were remarkable in the same way, her heifer calves I not probably be good milkers-at least no dendence can be placed upon them. If the ch increased of course.

t is not too much to say from experience, here at in England, that of all the varieties of cows. ignated by the terms, Short Horns, Long Horns, Hornless-or by the names, more limited in rapplication, as Devon, Hereford, Holderness. Stolk, Denton, Bakewell, Alderney, &c,-no se of them has been found to give uniformly or erally, more or better milk than any other .le evidence before the public, abroad and at ne, is contradictory.

There have been individual instances of extrainary milkers among all-and I may go so far say families, of extraordinary milkers, among

t has been too often taken for granted, that a d cow will produce good calves without inquiry her parentage or that of the bull to which is sent-and prejudices have been raised in for of marks and certain appearances, in such animal, which have no necessary connexion, or me at all, with her faculty as a milker-and such arks have been allowed to determine the choice another cow as infallible signs of a good one. Te most prevalent popular token now is the small d and short horns.—This is so far a good "Massachusetts Agricultural Repository,

sign, as that the smaller the refuse parts, the nearer a pure milk-stock, that is, a stock descended for mawil be the approximation to perfection in the more my generations from none but fine milkers. Some valuable parts, whether for beef or milk and this may think that the art of breeding cannot be caris ell. So much has been most satisfactorily ried so far as to secure a uniformity of excellence proved by the conclusive reasonings of Mr Clinc, in this particular quality in the progeny. The anthe eminent anatomist, in an essay published by swer can only be that they have attained to that him a long time since.*

The Holderness Breed have the small head and shor: horns, but they are esteemed in England the following appear to the writer not at all too much better fitted, in general, for the shambles than for the dairy. An established dairy stock might, 1. What is meant by a particular breed of no coubt, be raised from them by a careful selection of individuals, male and female, from a milk family. But it would be too much to say of so large a class as the Durham, Denton or Hereford, though all short horns, that bearing either of those names, they may be relied upon as good milkers. and to produce uniformly good milkers.

If the experience of the country will not bear the writer out in this remark he will be glad to find the dairy stock so much in advance of his opin-

to be so good for milk as some other kinds. And yet Nr Coke, the great Norfolk Farmer, sent to of Devonshire cows, bred by himself, which were remarkable for quantity and quality of milk. They were bred on the side of both male and female, we presume, from animals whose progenitors were distinguished for this same quality; had he frequently crossed the blood of the Devons with any of the dominating, or taking the place of other qualing equally good stock for milk, had not been so sof more recent standing in either of the parwell guarded, this same family would in a few generations have given evidences of material deprecia-

> The truth really is, that we have yet the work to do to establish a pure milk breed.

To accomplish this, we must have a class of farmers who shall be professed breeders of a dairy is of a pure milk stock the chances are very stock—they will employ no bulls but such as come of good cows, they will raise no calves but from first rate cows. They will keep the heifers for some generations, sending off to the butchers such as turn out indifferent milkers; as some there will be, in whom the faults of remote parentage will be found to linger .- A herd thus carefully purged, and finally, after a few years, exhibiting a uniforn character, for milk in the young, as they come in will prove a lasting and sure source of increasin profit to the skilful, intelligent breeder, and an inmense gain to the country.

The writer would ask, suppose a young farmer athe present moment is about to stock a milkfam and is willing to pay the full value of good cows -good, we mean as breeders-where shall be go fe them, in New England? Where shall he be see to find an established milk breed that will not dappoint him? He will find improved breeds eough-but who will venture to insure him that th improvement will not be found to consist g often in adaptation to the shambles as to the airy ?

The idea suggested, whether well or ill foundd, let others judge, is that we have not yet

degree of perfection in England-that for half a century thorough breeders, have been successful in this particular as in others. It is gratifying to be able to state any one thing on this most important subject, entitled to rank as an axiom and of a truly scientific character.

We say that thorough breeders have been entirely successful in England. Not that the farmers, generally in England have reached that degree of excellence. This would be far from the truth. All that is true even there, is the invaluable fact that particular families of milch cows are there known to transmit their peculiarity, as great milkers, with uniform certainty, to their progeny. This fact is as valuable, for our instruction and example, as if the same thing were true of all the mileh cows The Devon Cows are not considered in England in England. On the other hand, let the following statement have its due weight, going to show, as it does, that it is of some consequence for breeda frend in Maryland, several years ago, a number ing from what family an animal derives its descent. 'Mr Woodward of Birlingham, Woreestershire, England, purchased twelve deep milking Yorkshire cows without pretensions to breed, or disposition to fatten-with these cows he used a high-bred Hereford Bull-and in the progeny lost the disposition to milk which the mothers had; acquiring more deeply will it be fixed in the descendants; period kinds of Short Horns, whose descent, from dominating, or taking the place of other qual-tan equally good stock for milk, had not been so merit of the family to which the bull belonged.* merit of the family to which the bull belonged," Here is a striking case, where high blood enabled one of the parents to propagate his own peculiar excellence, and to prevent the transmission of the peculiar excellence of the mothers-viz. their tendency to be great milkers; because this quality was accidental in them and not derived from a select ancestry, and therefore not firmly established in the constitution.

FOR THE NEW ENGLAND FARMER.

BEES WILL SWARM IN FOUL WEATHER.

DEAR Sta-1 have this spring for the first time. undertaken the management of bees. I purchased a hive in the winter, which appeared to be very full, and placed it in my garden, giving it an eastern aspect. On the first of this month, I discovered a disposition to swarm, judging from their gathering in clusters on the sides of the hive: since which time, they have been carefully watched every day : from 10 A. M. till 4 P. M. except at such times as when the sun was obscured by clouds, feeling perfectly sure of their not leaving the hive, but in a clear sunshine. In consequence of the dull state of the weather, yesterday, I neglected them altogether, and was much surprised, when informed through a neighbor who fortunately saw them, that my bees had swarmed. At this time the sun was, and had been, during the forencon, obscured, and but few minutes previous to his discovering them, it had rained; I think it must have rained, during the process of swarming. In chap. 5th of Thacher's Treatise on Bees, he says, 'it is only on

^{*}Prize Essay of the Rev. Henry Berry.

a warm, clear sunshine day that swarming takes place,' and should the sun be obscured by a cloud, the swarming process is most certainly interrupted and they await the moment when it shines forth in full lustre.' It appears from the above statements that this is not an infallible guide; and I have been induced to communicate the circumstance of my bees having swarmed in weather, entirely different from that decribed in his chapter til the difference was only fifteen degrees, on swarming, in the hope that it may be needful in guarding bee keepers against relying implicitly the house, about half way up the rafters, where upon any state of the atmosphere, after the bees have evinced a disposition to leave the hive; the consequence of which may be the loss of many valuable swarms.

Your obedient servant,

Danvers, June 7, 1831.

WM. P. ENDICOTT.

BLAST ON CHERRY TREES.

Mr Fessenden-As a preventive of the blast, which has been so injurious to the cherry tree of late, I think you may with confidence recommed the application of sulphur and lime water, which has so effectually prevented the mildew on the grape and gooseberry, say two quarts of sulphur, and three to five pounds of quick lime, to a barrel of water, first incorporating them with a pailful of boiling water.

The preceding year, we had a large sized tree attacked; the present season, the depredation or blast continued, and to appearance one half of the tree was dead; when three weeks since it was discovered that four other trees of considerable size were attacked like the former on the north side, I purchased at the Farmer's agricultural warehouse one of Mr Newell's excellent syringes, and applied the wash three times. The difficulty is completely subdued, and from present appearances the tree first named will undoubtedly recover, with the loss, only, of a few small limbs. If this experiment should be announced to the public and any benefit should be derived from it, the gratification will be great to A CIRCUMNAVIGATOR.

June 14.

Horticulture.

Proceedings of the Massachusetts Horticultural Society at the an adjourned meeting, held at the Hall of the Institution on the 11th of June,

The President read the following communication from S. G. Perkins, Esq. giving an account of a second experiment, which he had made with the apparatus for warming his vinery with hot water.

Brookline, June 6, 1831.

HENRY A. S. DEARBORN..

Pres. Mass. Hort. Society.

SIR-Since I had the honor to lay before you the result of the first trial of my hot water apparatus, I have closed my house on all sides, and have made a second experiment with more success than on the former occasion, as the water was now heated sooner, by an hour, to the highest temperature that it attained on my first trial; for in two hours from the time the fire was lighted the mercury in the boiler stood at 175, and in the reservoir at 154; whereas, on the first trial it took three hours to heat it to these points. In three hours it was now heated to 199 in the boiler, and 184 in the reservoir, making a difference of 23 degrees in the boiler, and 28 degrees in the reservoir, over and above that which it be-

fore acquired .- On the first trial the difference Extra shed, where you have two between the temperature of the boiler and that of the reservoir was from 20 to 24 degrees, and it may be well to remark that the same relative degrees of heat between the two kettles was observed to exist on the last trial uptil the water in the boiler became heated to 180, when it became hotter in the reservoir in proportion to the boiler, un-

I supposed we could ascertain the mean temperature with considerable accuracy.-Here it rose to say eightytwo,-making a difference of seventeen degrees between this and another louse where there was no artificial heat; but where the temperature, in the course of the day, had been at \$5 and 90. The reason why the water was heated at the last trial sooner by an hour than at the first, is that the fire was better made, more steadily kept up, and the external or evening air excluded from both the kettles; whereas, you will recollect, on the first trial they were both within the immediate influence of it, the kettles were, however, both uncovered during the whole extra heat introduced into the house. time of heating.

As the circulation of the water through the pipes is facilitated by having its surface as near the top of the upper pipe as possible without allowing it to draw air, the kettle should not be filled beyond an inch, or an inch and a quarter tender exotics when the flue is over heated; nor above this point; of course, as a general rue, it are you liable to those chills which often occur is best not to heat your boiler above 185 or 186, from neglect of the fire, and which prove equally as the evaporation would become so great as to fatal to them. With water pipes, a sudden or exreduce the water in a short time below the pp of treme heat cannot be got up; and at no time, and the pipe. - By heating to the temperature of 199. as I did in this last trial, I found the evaporation very great, and in the morning I observed the in like manner, and it is never scorching or dry water stood in the kettles half an inch, or more, below the top of the bore of the upper pipe.

agreeable, and is said to be congenial to all plants, or cold weather, the fire must be made an hour -There is none of that dry, suffocating heat which earlier in the hot water establishment, than may be prevails when a house is heated by a brick flue required where a brick flue is used. This is the alone; -nor any of that extreme moisture which only inconvenience attending it, if it be one. is produced by steam apparatus; -but a soft, mild, If to the cost of the brick flue, as above and pleasant warmth is created throughout the house, exceedingly agreeable to respiration.

To compare the advantages of the hot water system with brick flues, it is necessary to make a calculation of the relative expense which these two modes of heating involve, -and I believe that the following estimate will not vary much from

1st. Two kettles of 80 gallons each, cast vith the shoulders necessary to receive the pipes, vill cost \$21 each, or

The connecting pipes of cast iron, four inches in diameter in the bore, will cost

15 00

furnaces, one at each end of the

10 00 \$110 00

The hot water apparatus therefore cost in the first instance \$50 00

say fifty dollars more than a single brick flue, or three dollars per annum. Now the water establish-The thermometer was placed in the centre of ment once up there is an end to the expense,-But a brick flue, (as every one knows who is nt the charge of repairing them.) is a constant source of expense, certainly more than double the interest on the extra cost of the hot water apparatus. Again, with the hot water there is no danger of burning or scorching your plants; but with a brick flue you are constantly liable to this evil; and from the cracks through which smoke issues into the house, it is well known that plants are frequently destroyed. - I have myself this season had three large grape vines much injured by the hot smoke and air that passed through the cracks in one of the fines in my old vinery; but with iron pipes, filled with hot water, there can be no smoke, or

The boiler and reservoir are within the house. but the fire place or opening into the furnace is in the shed on the other side of a brick wall, so that you have never within the vinery any of that ardent and dry heat which is so often injurious to by no means can it be raised so as do any injury, The temperatore is raised gradually, and is reduced even, like that created by brick flues; or suddenly changed from one extreme to the other, as is com-The heat produced by this system is uncommonly mon in that mode of heating houses. In winter

\$110 00

stated, say you add, as a corrective of the dry heat of the brick-a steaming apparatus, you may do it with great advantage to a vinery either connected, or unconnected with one of the furnaces which heats the flue. -If it is connected, then the house will be steamed, at the same time that it is heated by the flue,-but I am satisfied from my own experience that steam alone, with any apparatus that has ever been got up in this country, will not answer to heat a house during cold weather; but a cheap steaming apparatus with a boiler connected with one of the furnaces of the house, may be put up with advantage, S0 feet long for 50 00

\$160 00

This would make the whole cost of the flue and steamer one hundred and sixty dollars-the same as the cost of the hot water apparatus.

Now if you will look over the various advantages which this last has over the first plan of heating; as well as the great saving of expense in fuel, labor, repairs, &c, you will see that there can be no comparison between these two modes of

her houses.

Where hot water is used, steam is unnecessa-:- the moisture of the house is sufficient witht being excessive, as it is with steam apparatus; d it has this advantage over it-if your steam paratus be connected with the furnace that heats ar flue, all plants in the house will, during its teration, be perfectly wet,-this, while the house warm, may do no harm-but so soon as the fire es out the air becomes chilled, while your plants still wet, which exposes them to be injured ch more than if they were dry .- Now with water, although the air of the house is not , it is not wet as in the steaming process, and going down of the fire, or its total extinguishnt, does not expose your plants to get injured.

MENCH PREPARATION OF COFFEE.

SMITH-In all that concerns the table, the reth far excel all other nations. Their dishes re avory, palatable, soluble, and wholesome. nated your receipt for making coffee in the parand kept in a glazed vessel over night, before sed, the morning; but you have omitted two im-

other from a gentleman who had resided in a in green Tea, as yulgar prejudice will have it. French family which came to this country from St The injurious effects of Tea, if any may be Domingo. Mr Carter says, the French add boiled milk to their coffee, which gives it a mellowness not to be imparted by cold milk or cream; and my other information is, that the French sweeten their coffee with sugar candy, or sometimes with what is about the same thing, with elarified syrup, not yet reduced to a state of crystallization. The process for making either of these is sufficiently simple. but as the last has abridged labor, and many cenveniences to recommend it, I will speak only of that. An egg with its shell is beat up to a froth and added to two or three quarts of water in a bell-metal kettle-from eight to twelve pounds of sugar (either brown or white) is added to this, (I am told a few glasses of lime water is a useful addition, but I have not tried it,) and it is simmered and scummed over a bark or coal fire, until clarified and reduced to a syrup of the proper consistency, when it is put up for use. Besides for coffee, this syrup is also excellent for fritters, puddings, &e, if a little Cogniac is added to it. I have tried all-the strained coffee, the boiled milk, and the clarified sugar, and commend the whole.

COUSIN TABITHA.

MINES AND MINERALS.—During our return from Montpelier week before last, we spent a leisure half hour in visiting a mine just opened in the northeast corner of Braintree. Some specimens which we brought away preved, on analysis, to be composed of Iron, Sulphur and Arsenic, with, possibly, a slight and unimportant admixture of other metals. The vein or bed, we could not determire which it is, is known to be at least a mile in length. An abundance of elegant specimens can be easily procured.

An interesting locality of sulphurets has been opened in Vershire. It is about three miles from Post Mills Village, and about five miles north from the copperas works in Strafford, and nearly in a range with the vein wrought at that place. Of three specimens given us for examination last winter, one was pyritous copper, containing 184 per cent of copper; another was a magnetic sulphuret of iron; and the third was sulphuret of iron, with an extra charge of iron. This last ore is not nentioned by Cleaveland: nor could any information concerning it be found in the books in this Village, beyond the fact that Hauv mentions its existence, -Probably the copper at this mine varies considerably in its richness. In what proportion the several ores exist, we are not informed. Their quantity is abundant, and their situation extremely favorable for working.

About five miles nearly northwest from this, in Corinth, about 2 miles south from the meeting house in that town, is a locality, from which we have seen what appeared to be fragments of very beautful crystals of oxid of Titanium-several varietics. We think the spot worthy of the attention of any mineralogist passing that way. Sienite is said to be abundant and beautiful in its immediate vicinity .- Windsor, Vt. Chronicle.

Tra. - The present yearly consumption of this plant in Great Britian is 20,000,000 lbs; in 1716 reah mode, though the ground coffee be wet into it was only 300,000 lbs. ating hot houses, or vineries, or indeed any NewYork, who lately travelled in France, and the coverable, and not the slightest particle of copper ascribed to the heated state in which it is drank .-Genesee Farmer.

> Spontaneous Combustion .- On Tuesday last, a noon, a small quantity of rye straw took fire at the McLean Asylum, in Charlestown. The fire was discovered immediately and extinguished in 4 or 5 minutes, the damage not exceeding five dollars.

> The straw, as usual, had been emptied from beds into a bin adjacent to the straw house, both of which are detached from all other buildings. The bin is 8 feet by 5 feet, open at top, exposed to the direct rays of the sun from 11 to 1 o'clock. The straw had been wet by recent rains, was two feet deep, and very compact. The whole mass was hot down to the bottom of it. It is improbable that sparks had fallen upon the straw from a neighboring, though distant chimney, as the wind at that time would have carried them in a centrary direction. Daily Advertiser.

> Management of Poultry .- Break shells of ovsters and clams to about the size of grains of corn, or smaller, and place them where your barn-fowls can have constant access. They will eat of this, and it greatly assists in forming the shell of the egg. To insure success in the raising of poultry. the newest laid eggs should be gathered with the utmost care, to avoid any small break or fracture of the shell; the setting hens should be each in a barrel or box by itself, so that they can be covered up in order that they may sit undisturbed. Once a day and that in the morning, they should be gently lifted off their nests and fed, and the moment they return, be again covered. They will in two or three mornings, become quite habituated to this order, and almost every egg put under them will produce a chick. The feed of chickens, and mere especially ducks and turkeys, should be Indian meal, ground coarse, and mixed with sour

Simple means of purifying water .- It is not so generally known as it ought to be, that pounded alum possesses the property of purifying water. A large table spoonful of pulverised alum, sprinkled into a hogshead of water, (the water stirred round at the time) will after the lapse of a few hours, by precipitating to the bottom the impure particles so purify it, that it will be found to possess nearly all the freshness and clearness of the finest spring water. A pailful containing four gallons, may be purified with a single tea spoonful.

GOOSEBARY BUSHES.

A gentleman who has for several years protected his gooseberry bushes from the disease or insect, which is so destructive to this fine fruit, informs us, that the disease (which he thinks is an insect) originates in a kind of moss, which is observable in spots on the stock and branches of the bush, and that whenever he finds it on them, he immediately cuts off the limb. He has left with us several pieces of the bush with the moss on them, in which he entertains no doubt the egg of the insect is deposited. Since he began cutting off these ingouter stone are unknown in China, is ascribed to feeted limbs, he has had abundance of fine gooseberries, which he could seldom obtain before, t particulars which I will supply-one I deri- cal experimets, made some time since on green and It would be well to try the experiment at least.-

TULIPS.

Now that we feel the 'etherial mildness' of spring, we may perhaps turn our thoughts for a moment to the subject of flowers.

Of the early history of the Tulip, from its discovery among the Turks, to the extravagant speculavarious countries, but particularly in Holland and England, about a century and a half ago, our readers are probably as well acquainted as ourselves. Mr Neale, however, has put into our hands a leaf from a very old Magazine, from which we quote the following paragraphs on the fondness of the Turks for the Tulip,' from the Opuscoli of the Abbe Sestini which will probaly amuse, if it does not instruct the reader.

The Tulip, called in the Turkish language Lale, is a flower which these people were so passionately fond of, that they employed the utmost care to bring the cultivation of it to perfection. They did not set much value on those, the bulbs of which were brought from Holland, because it is an established rule among them to esteem more whatever grows in their own country, than the productions of foreign nations.

Tulips, however, have been in so great request and so much sought after at Constantinople, that, several Sultans have ordered roots to be brought base of either, when separated from the acid, them from all countries, in order that they might have every possible variety of these flowers. To these 'varieties they even gave Turkish names, which had some relation to those of the first offices in the Oitoman empire; and they commanded uniting with grease as either of the before menthat a catalogue should be made out in the Tur-tioned acids—that is carbonic. Now this acid is kish language, of all the different species.

Under the Sultan Achmet III. who was passionately fond of this flower, all the nobility of his court applied themselves to the cultivation of it, with the greatest care, and to procure uncom- form soap. mon kinds, with the newest and most beautiful

These nobles presented their tulips to the Sultan, on a certain day of the year; and this ceremony, which was extremely splendid and magnificent, was called riafet-latesi that is to say, the festival of tulios.

remarkably fond of tulips. As he had never seen bottom of the leach, and but few can tell why they manufacture the article extensively. They are now any blue ones, he took it into his head that he could, by the assistance of art, procure flowers of that color. He therefore consulted on this subject ger affinity for carbonic acid than totash has, and About six tons of copperas have been manufactured different Turkish chemists, who all agreed, that to of course will separate it from it. Common limehave blue tulips nothing more could be necessary, stone is lime and carbonic acid: when limestone but to put into the bulbs the flowers of the syringa is burned in a kiln, the carbonic acid is separated carulea. The experiment was tried, but, as may by heat, and quickline is formed. Now if this well be supposed, was not attended with success

er pleasure from these tulips. They waited for thing necessary then to have it unite with grease, the moment when they were in full bloom in their is to have it of sufficient strength.—This may be gardens, and intermixed them with small lighted ascertained by its specific gravity-to learn which, lamps and eages, in which they inclosed nightingales taught to sing; thus endeavoring to gratify both the senses of seeing and hearing. This festival was called cieragan, that is to say, the illumi-through ashes. The grease made use of is the renation.

This reigning passion for tulips continued in Turkey under the Sultan Mahmond, and the Sultan in water. The quantity necessary for a barr l of an object of more magnificence than the Falls of Mustapha; but after the death of these emperors. it gradually decreased. The Turks at present do not entertain an exclusive passion for tulips, and they set almost the same value on them as we do. salve-like, capable of being spread thin upon ebth never saw the rising sun in its utmost splendor, -. SOAP.

may be acceptable.

Much difficulty is frequently experienced in would on the other quality. tions in the roots, as articles of merchandise, in this business, and many vulgar errors have been connected with it; and we have heard women declare that they believed their soap was bewitched. When the principles are once understood, the erties of the component parts of soap.

> soaps : potash and grease make soft soap only, but soda and grease make hard soap. Both these alkalies have a strong affinity for acids-uniting with them and forming what is generally called neutral salts. Thus potash and nitric acid form saltpetre ; soda and sulphuric acid form glauber salts, and soda and muriatic acid, or spirits of salts, form common

Now no woman in her senses would think of making soap with either of these salts; and yet the would form when mixed with grease, as good soap as if they had never been united.

There is also another acid which combines with these alkalies, which will equally prevent their continually floating in the atmosphere unseer, and will combine with potash or soda whenever it comes in contact, forming a carbonate of soda or potash-neither of which will unite with grease to

Much of the difficulty which housekeepers meet become more or less saturated with carbonic acid. Ashes which have laid long in a damp place, or become damp by any other means, will absorb earbonic acid, or if the lev is allowed to stand too long after it is leached in an open vessel, the same The grand Vizier, Ibrahim Baschia, was also thing will take place. Lime is often placed in the do it. If the question is asked, the reply is-because it makes the ley cleaner. Lime has a stronquick or fresh-burnt lime is placed in the bottom of the leach and the ley made to pass through it, The Turkish nobility derived afterwards anoth- it becomes purified from the acid, and the only put a new-laid egg into it; if the egg floats the ley is strong enough; if it sinks, the ley must other be evaporated by boiling, or by again leaching it fuse fat of animals, and before it is united with the welcome the rising sun, and to waken man to ley, should be freed from all the salt by boiling it industry. The glorious orb of day is in itself good soap is about sixteen pounds, or half a pound Niagara or Montmorenci, the Peak of Teneriffe, to a gallon.

without flaking or rolling off. If to such scap the sublimest spectacle in creation.

about an equal quantity of soft water is added, the As this is the season of the year when most of soap becomes hard and liver-like, capable of being our housekeepers attend to making soft soap for taken up in the hand. This many think is desirthe use of the family, we trust a few observations able, -especially the soap-boilers who make it for sale, as they make double the profit they

Some housekeepers practise making their own hard soap. This is done by adding salt to the soap after it is well made, while it is yet boiling, The effect is thus explained. Salt is soda and whole process is easy and simple. First, then, it muriatic acid. Potash has a stronger affinity for is proper that housekeepers should know the prop- muriatic acid than soda has, and when they come in contact, as in this case, the potash decomposes There are two fixed alkalies used in soapma- the salt and combines with the muriatic acid, formking, viz. potash and soda. Potash is called the ling a muriate of potash-leaving the soda pure to vegetable, and soda the mineral alkali. Either of form a hard soap with the grease :- the muriate these alkalies will unite with grease and form of potash will be found on cooling, in solution at the bottom, being of greater specific gravity than the soap. The salt should be added by small quantities until the separation takes place, which may be known by the soap becoming curdled: after which it should be allowed to stand until cold. when it may be cut into bars or cakes, as suits the operator. Many suppose that resin is necessary to harden the soap. This is not the case; it is used as a matter of profit-not of necessity,

The common yellow color of soft soap is owing to the iron contained in it, as the oxide of iron is dissolved by potash. Where white soap is desirable, it may be made by substituting pearlash or carbonate of potash, and abstracting the carbonic acid by lime-and by using lard or other white grease, the purest white soap may be made .- Genesee Farmer.

Copperas .- It may not be generally known to our readers that a Copperas mine was discovered about two years since, in the town of Templeton, Worcester County. We have been obligingly furnished by a gentleman who has recently visited the with in soap-making, arises from their ley having mine, with the following particulars respecting it. About two years since, a mice was discovered in Templeton, Worcester county, and the lands adiacent, to the amount of 200 acres immediately purchased by a company from Worcester. The Company have erected suitable buildings and have been at considerable expense in making arrangements to in the 'full tide of successful experiment.' The ore produces about 75 per cent of the pure article. and more than six hundred tons of ore have been discovered lying in one pit. The mine is supposed to be inexhaustible. Sufficient may be manufactured from it to supply the whole country. We hope the efforts of the enterprising company who have embarked in it, will be attended, as there is every reason to suppose they will be, with complete success .- Dedham Palladium.

MORNING AIR .- The most wholesome and invigorating air of the day is usually at daybreak The man who rises at the dawn of day, may enjoy a pleasure that is denied to a slumberer. It is the best time for exercise. The birds gayly carol, to or Etna. Yet how many traverse sea and land to Soap when well made, should be thick and behold these terrestrial objects, while perhaps they

FARMERS MAKE THE REST PURLIC MEN

In a very clever little book for young people, called Louisa and her Cousins, we find the following remark : Good farmers have always been held in high estimation. I came across an anecdote, the other day, which proves that this was the case in very ancient times; it is related by Herodotus, who is called the Father of His-The inhabitants of the island of Miletus, in the lonian Sea, having been for a long time afflicted with internal dissensions, at length solicited the interposition of the Parians, inhabitants of an adjoining island. When those, whom the Parians selected to perform the office of arbitrators, arrived at Miletus, finding the whole state involved in extreme confusion, they requested permission to examine the condition of the lands. Whenever, in their progress through the island, they found any happen in many instances, they wrote down the name of the owner. On their return to Miletus, they called an assembly of the people, and placed the direction of affairs in the hands of those, whose names they found on who took the best care of their own business, could be most safely intrusted with the public interest. These officers were appointed, and tranquillity restored."

This anecdote struck us particularly, because it exactly coincided with our ideas of the true principles on which the privileges of citizenship should rest. In framing our own government, and under the new order of things in France, it was an important question what should give a man a right to vote. A certain, though small income, was decided on by our legislators, as the necessary qualification; and this test has much of reason and justice in it, because a comfortable income is the visible representative of industry and good character --for it is certainly true in this happy country, that all who have health, can obtain a decent maintenance, except the lazy and the dissipated.

So far therefore as this principle merely extends to excluding vagabonds, it is a good one; still it does not touch all cases; for wealth may be inherited by the lazy and the dissipated, and thus the privilege denied to the vicious beggar may be bestowed upon the equally vicious rich man.

It appears to us that the proper qualification for voting is to have some regular and constant employment --- to perform a decided use as a citizen, in the way of some

This shuts out both extremes --- those who are idle because they are rich, and those who are poor because they

BOSTON, WEDNESDAY EVENING, JUNE 15, 1831.

BEE MOTH.

FRIEND EDITOR-I have been a constant reader of the New England Farmer, and have read various communications about the management of bees; but the right subject has never been discussed. the Bee Moth? If any of your correspondents would be so kind as to give the information I want, they would merit the best thanks of society.

I kept bees twentyfive years; but at length the Bee Moth found its way into the hives, and have destroyed all but one; and that I am afraid of losing the present season. I have become almost discouraged about the raising of bees, and, as a son for information on the subject, to know whether anything can be done to guard against so desolating an insect.

Remarks by the Editor.—In Dr Thacher's Treatise on Bees (which our correspondent may procure for a trifle of sundry booksellers, as well as at the office of the New England Farmer,) is a valuable dissertation on the bee moth. This suggests sundry remedies against the insect complained of and proposes 'a plan for an Improved Bee-house,' intended to guard against it. We shall not reprint this article, because the copy right of the work is secured to its publishers, and its republication by us would trespass on their property.

Mr John Stone, of Sudbury, Middlesex county, Mass, in an application for a premium, to Mass. Agr. Soc., states in substance that he had kept bees for ten years last past; that for several years his bees were meh injured by the bee moth-that he lost two hives of bees which were wholly destroyed by the insects. 'In the spring of 1824 or 1825, about the first of April, I raised my hive about 5 of an inch by putting a small block of that thickness under each corner of the hive ; immediately the bees commenced the work of destruction upon the moth-worm and entirely cleared the hive lands under good cultivation, which, by the bye, did not of them. I have followed the practice ever since and have never received any injury from the bee moth, the worm having been invariably destroyed by the bees, and brought out of the hives. The their list of good cultivators; because, as they said, those hives have remained in this situation till the month of October, when I have taken away the blocksand let them down,'

> The late Dr Low, of Albany, recommended the suspension of hives a few inches above the floorboards by cords, and to have the floor-board moveable up and down, according to the weather. Mr David Chandler of South Hadley, Mass. recommends (N. E. Farmer vol. vi. p. 321, 322) placing the hives on the bare smooth ground about the first of May, or perhaps earlier, at some distance from the bee house, and placing back, late in the fall of the year, the hives which are to be kept over winter. The objections to these remedies are, that they expose the bees to be annoyed by rain, dust, wind, toads, and other reptiles, robbers from other bives, &c.

> Dr Smith, in his Essay on Bees, (another cheap and useful little work, printed by Perkins and Marvin, Boston) in treating of the bec-moth says A very simple plan, and sometimes it is eminently successful, consists in placing a burning lamp in a pail near the apiary. I have been quite successful in taking prisoners by this device, in the early part

the top, by reason of the incurvation of the staves, having, in the meantime but one head, is the best trap. Some fresh honey or if not readily obtained even molasses, spread over the bottom is the bait. All insects are particularly charmed by a bright light; and none more than the bee moth. As soon as they discover the light they fly towards it. Another sense, which is probably strongly developed, smell, is gratified by the odor of the food; and hence they have a double inducement to enter into the trap, where the blaze of the lamp or their thin spread wings gives them the finishing blow and tumbles them into the bottom. With a little management thousands may be caught with very little time.

'Another method, which I have practised successfully, is this, viz: set a long ne k bottle having a little honey on the bottom, under the floor of the bee-house, and another perhaps on the roof. When once inside it is extremely difficult for them to make their escape. Drawing a piece of gauze, or making a wire door on hinges over the aperture to the hive, which is closed over night is another very good scheme. But this must be opened very early in the morning as the bees begin to forage by the earliest dawn. The gate most effectually keeps the moth from getting within, though the bees, thus confined, exhibit much restlessness, and impatience during the time they are imprisoned within their own castle.

Dr Thacher proposes to save hives from the insect by placing them within an Improved Bee House;' according to a plan of which the details are given page 108, of his Treatise. He observes, 'I have now a bee house of the above description which meets my sanguine expectations."

Some writers have suggested that in fixing bottles and other vessels as traps, baited with honey to eatch moths, there is a danger of catching and destroying the bees themselves as well as their enemies. We hope that some of our correspondents who have a practical, as well as theoretic acquaintance with this subject will comply with the request of P. C. given above, and tell us how to destroy the bee moth, or at least point out the best way of guarding against its ravages.

FARMER'S WORK FOR JUNE.

Among the multiplicity of your avocations at this busy season of the year you will not forget the subject of summer made manure. Manure is the spirit of agriculture, the essence of all good farming, and no good opportunity to increase its quantity and improve its quality should be suffered to pass without improvement. Cattle, or at least cows which give milk, should be yarded in a small space. Their manure, once or twice a week, at least, should either be ploughed in or mixed with soil for compost-placed under cover -shovelled into heaps and covered with earth, or in some way secured against being wasted away by the elements. A large quantity of manure may be manafactured by swine, provided you fur nish them with raw materials, such as weeds, brakes, decayed leaves from forests, &c; or you may manage this department of rural economy as follows, viz.

Let your hogs be inclosed in an open pen, near to, or in one part of your barn-yard; throw into this the scrapings of your barns, together with every vegetable substance that will putrefy and rot through The idea struck me, that if I interrupted the the summer: plough up and cart in occasionally, sap at a distance from the main stem by ringing a premium is claimed, must be so designated, other-

or old sward balks; your logs will root and mix them together, and thus with a little attention, you may obtain 20 or 30 loads of the best manure, or much more if your hogs are numerous and receive your attention. You will find an advantage, both in the growth of your hogs, and in the quantity of manure, if you sow half an acre, or an acre of clover on a rich soil near the barn-yard, and begin to cut early for feed for your hogs, it will be found both cheap and profitable. According to the best practical calculations, it will give a profit of \$30 per acre, when cut green and fed in the barn-yard, either by horses, cows, cattle, or hogs, besides the profits upon the manure. If you are in carnest about your farm, you may carry this mode of making manure to any extent, by mowing and carting in your stout stubble; collecting and carting in your coarsest hay, pumpkin and potato vines, corn bottoms, husks, &c. The same materials will yield you a stronger and richer manure from your bog pens, than from the stercorary, (as practised in England,) and without the expense of shifting, or changing it by hand, as in the stercorary practice. Your hogs will do better than in a close pen, and the same land, in clover, will yield them more and better feed, than in pasture; and the manure thus obtained from the clover-field, will give you a handsome profit. A little experience will soon lead every farmer to make the most advantage in this way, which may be rendered very extensive.

FAVORS FROM FRIENDS.

We have recieved a number of fine specimens of the fruits and flowers of the season, and other samples of taste, industry and ingenuity, which we now gratefully acknowledge. Among other donations of the kind are a pot of strawberry plants, Keen's Seedlings, which have borne fine fruit abnodantly since they came into our possession, from Mr DAVID HAGGERSTON, of Charlestown. A large and elegant Bouquet, composed of a great variety of flowers, of the finest bues and fairest fragrance, from Messrs Winships of Brighton. A sample of American Sugar of American manufacture from Mr EDWARDS of Springfield, Mass. &c,

APPLES WELL PRESERVED.

Mr J. Perry of Sherburne, Mass. has presented us with a sample of apples, preserved in pulverizea plaster of Paris, which were sold in Boston market for \$6 a barrel. The apples are of the kind called Nonsuch and were as fair to the sight, and pleasant to the taste as if they had just been taken from the tree.

ON A MODE OF COVERING THE NAKED BRANCHES OF FRUIT TREES WITH NEW WOOD.

Extracted from a letter to the President of the London Horticularid Society, by Samuel Spiver Street, Esq. of Penryn Cornwall.

It is a fact well known to Horticulturists that the branches of fruit trees trained against the walls, and espaliers, after eight or ten years become naked for about a foot or two nearest the stem, which gives an unsightly appearance to the tree, espesially when the branches are trained horizontally; and it is generally difficult to procure blossom spurs, or even wood shoots, in those situations, inless by training a new shoot, from the main stem, which cannot be always procured.

of the evening. A keg, because it is smaller at such earth as can be collected from your ditches, the branches, shoots might be produced between the ring and the stems and the result has proved that that my idea was correct. This, spring when the blossom buds were about to burst, I made a ring to the extent of one fifth of an inch, in the usual way, at the distance of two feet from the main stem, round a branch of a Jargonelle pear tree, trained horizontally, which branch had for several years been entirely bare both of fruit spurs and wood shoots; nor was there the smallest appearance of an embryo bud at the time of ringing. I soon found that a space to the extent of seven inches nearest the ring began to break into buds; at this time (July) there are six fine buds broken and two embryo buds are visible, which I have no doubt will break next spring. The part of the branch nearest the stem, about seventeen inches, is still without a bud : I therefore conclude that six or eight inches should be substituted in future ringings instead of two feet. Another experiment has confirmed this opinion. About this time I made that on the Jargonelle, I also ringed a branch of a Bergamot Pear tree at six inches from the stem, which has at this time six buds broken and four embryos very prominent.

MASS ACHUSETTS HORTICULTURAL SO-CIETY.

The Standing Committee on Fruits and Fruit trees, respectfully propose the following premiums for the year 1831, viz:

For the best Apples, not less than two dozen, 84 00 a premium of For the best Summer Pears, not less than one

dozen. For the best Autumn Pears, not less than one

For the best Winter Pears, not less than one dozen. For the best native Pears, not less than one 4 00

4 00

4 00

00

00

00

00

00

5 00

3 00

2 00

2 00

dozen, For the best Peaches, not less than one dozen,

4 Apricots. 3 46 $\bar{3}$ Nectarines, Plums, 3 66 46 2 Cherries. $\tilde{2}$ 66 Native. do. Foreign Grapes, cultivated under 5 00 glass, not less than three clusters,

Foreign Grapes, cultivated in open ground, not less than three clusters, Native Grapes, not less than six clusters.

Gooseberries, not less than one quart, Strawberries, not less than one quart,

Raspberries, not less than one quart. For the best method of cultivating Foreign Grapes in open ground, which shall be

superior to any other now practised in this country, with reference to planting, training, shelter, &c, and for a length of trellis not less than thirty feet, The Committee have hopes that the mode now

universally acknowledged in France, to be the best practised in that country for open ground culture, may be successfully introduced into the United States; they allude to the Thomery method, a particular description of which may be found in the Bon Jardinier for 1830, with a plate, and an accurate translation of the same by the Hon. Mr Lowell, in the N. E. Farmer, vol. 6, page 73.

The Committee will be at the Hall of the Society on Saturday of each week, during the season of fruits, from ten to twelve o'clock, to inspect such specimens as may be offered. Those fruits for which

383

ise they will be considered as offered for exhibi-

on only. Per Order, S. DOWNER, Chairman, pro tem. Samuel Downer, Chairman, pro tem.

ERRATUM.—In the communication from S. G. Perring, Esq. the subject of heating hot hooses by hot water, an error of consequence occurred, which we noted for correction in last week's paper; nee occurred, which we noted for correction in list week's paper; jour notice was misland, or given to the winds by the type-setter, beterfore, once more, attempt to rectify the instale. In the galladed to, page 383, line 21 from the top of the first column, read of a 'luttle after 2 o'clock,' read a little after mus c'clock, mistake is important, because it represents the water to have in 8 lours in heating instead of 3 hours, which was the fact, and the set of the se wo hours to the same temperature.

Agricultural.

he Trustees of the Worcester Agricultural Society hereby notified, that a meeting of the Board will be ad at the Probate Office in Worcester, on Thursday, the day of June instant, at 4 o'clock, P. M., for the purhereby notified, that a meeting of the Board will be e of choosing an Orator, Chaplain, Committee of Argements, and Judges of Stock, &c, for the next Cattle w; and also for the admission of members.

y order of the President.
WILLIAM D. WHEELER, Rec. Sec'ry.

Vorcester, June 8, 1831.

Howard's Cast Iron, Ploughs, &c.

ast received at the Agricultural Warchouse, Nos. 51 a 52 North Market street, a few of C. Howard's Patent Of Iron Ploughs. This is the most approved Plough in use, and is highly recommended by our best fars for doing the work with case and in the most permanner; the casting being ground smooth, the gh is not liable to clog even at the first time using, curs perfectly free at all times.

so,—Taft's superior cast steel SCYTHES, manufac-

u 1 expressly for this establishment. Likewise, Passa · assortment of Garden tools.

so,-Hall's superior Hay Rakes-the best article of ind manufactured in the country. June 15.

Farmer Wanted.

permanent situation offers for a man who unders farming generally, and a little of gardening, and would feel an interest in his employer's business,on to a farm in one of the pleasantest towns in New aand, on Connecticut river. Apply personally at e lew England Farmer office.

Farm Wanted.

Inted, a first rate Farm in the vicinity of Boston, ining 100 to 150 acres of land, with a good and connt house, harn, &c.

ters (postage paid) addressed to R. S. H. Salein, giving a particular description of Farms, of fence, price, taxes, &c, will receive immediate attention. cptf

Manual of the Practical Naturalist,

ming an Appendix to the first six volumes of the ry of Entertaining Knowledge. This day publish-LILLY & WAIT, and by CARTER, HENDEE & OCK, The Practical Naturalist—Directions for Cul-total Preserving subjects of Natural y—containing instructions and receipts according most approved methods for taking and stuffing upeds, Birds, Fishes, Reptiles-sclecting, preg and arranging Iosects, Minerals, Plants, Shells, June 15.

Wrought-Iron Ploughs .- Bar-Iron, &c. ught-Iron Ploughs, of all sizes .- Also, A Complete nent of American, English, Swedes and Russia Bar American Braziers' Rods-Spike and Nail Rods, Shapes-Hoop and Band Iron-Steel of all kindsox and Mould-board plates, &c. constantly for sale

GAY & BIRD, 6tis. No. 44, India Street, Boston.

Wm. F. Otis & Co.

110, Faneuil Hall Market, have a good supply of nion Pink roots, Pioe Apples, and fine West India H. GRAY & CO. No. 68 Kilby street. wies, from Trinidad de Cuba. May 18.

Brass Suringes.

For sale at the Agricultural Warchouse, Nos. 51 and 52 North Market street, a very useful article for destroying Caterpillars, Bugs and other insects. Likewise to prevent the mildew on Vines and Gooseberry Bushes .-See N. E. Farmer, vol. 8, page 358 and 363.

The true Sugar Beet.

For sale at the New England Seed Store, 52, North Market street, Boston, 100 lbs. of the true French Sugar Beet Seed,—received this day from Paris, by the last Havre packet, via Newport. The excellence of this toot for cattle, and for culinary and other purposes, is too well known to require comment.

Also-Large and Small Lima Beans-Early Dwarf Beans—several varieties of pickling and other Cucum-bers—Radishes, Lettuces, Cabbages, Turnips, &c.

BROOM CORN. Also, just received, a few bushels of prime Broom Corn raised last season in the vicinity of Connecticut river.

Sheep - Sheep.

Valuable Books on the best method of forming good flocks, of increasing them, and treating them properly when in health and when diseased-on the character and value of Merino Sheep-anatomical structure, &c, &c-5 valuable works, viz:

Sir George Stewart Makenzie, Bart.

Robert R Livingston, LL. D.

Samuel Bard, M. D.

M. Danbenton, a man of letters, and profound Naturalist; his work was published in Germany, Italy, Spain, and America-and in France, at the expense of the nation.

Mr Tessiu, inspector of the Rambouillet Establishment-and others in France.

Also for sale-a valuable collection of Books on Agriculture, Manures, various treatises on Horses, Cattle, Botany, &c, &c. By R. P. & C. WILLIAMS, wholesale and retail Booksellers and Stationers, No. 18 and 20 Cornhill, Boston. May 25.

Wants a situation.

As Gardener, a married man without children, who understands the management of a garden in all its various branches-hot house, green house, laying out garden ground, &c.

A few lines will be thankfully attended to at this office.

Bees in Cities.

AN ESSAY on the practicability of cultivating the Honey Bee, in maritime Towns and Cities, as a source of Domestic Economy and Profit. By Jerome V. C. Smith, M. D. Just published by Perkins & Maryin, 114, Washington Street, and for sale by J. B. Russell, at the Agricultural Warehouse, No. 52 North Market street, price 38 cents.

For Sale, Full blood Aldnerney and Short Horn Bull and Heifer Calves.

Two Alderney Bull Calves, and one Heif r Calf. Also, one Bull and two Heifer Calves of the Short Horn or Teeswater breed, all from full blood imported stock, on both sides. For terms apply at this office.

Potatoes for Seed.

For sale at the New England Seed Store, No. 52 North Market Street-

A few bushels of the line seedling potatoes mentioned by the editor of the New England Farmer, vol. viii, p. 102. This is but the fifth year from the ball; they have twice taken the premium from the Essex Agricultural Society. (See Colonel Pickering's Report, N. E. Farmer, vol. vi. page 98) They are represented by the person who raised them, as tolerably early, more than middling bearers, remarkably delicate and mealy, size nearly round, color white, and have but very few protubecances. A good opportunity now offers to farmers to secure a superior variety of this important vegetable for seed. Price \$1 per bushel May 18.

Lead Pipe.

LEAD PIPE, all sizes, constantly for sale by LINCOLM FEARING & Co , No. 110, State Street. April 13, 1831.

Bones Wanted.

Shin and Leg Bones constantly purchased by GEO. April 20.

Treatise on Sik.

Just published, and for sale at J. B. Russell's Seed Store, 52 North Market Street,

A Practical Treatise on the Culture of the White Mulberry Tree and the raising of Sdk. Price 42½ cts.-\$9 per hundred-a valuable agricultural tract for distri-

BRIGHTON MARKET-Monday, June 13.

[Reported for the Chronicle and Patriot.]

At Market this day 252 Beef Cattle, 22 Cows and Calves, and 668 Sheep and Lambs. 46 Beel Cattle, were includ. ed last week. Unsold at the close of the market 75 Beef

PRICES .- Beef Cattle-Market continues 'glutted;' a falling off from last week of about 17c. per hundred. We shall quote from 4 50 to 5 33-extra at 5 58.

Cows and Catves-Sales were effected at the following prices, \$15, 17, 20, 23, 25 and 30.

Sheep and Lambs-We noticed one lot at \$1 75 one at 183, one at 2 00, and one at 2 33. - About 50 wethers not sheared were at market, sale effected at 5 124 each.

BOSTON FANEUIL HALL MARKET .- Early Peas 75 cents per bushel. Marrowfat Peas \$2. Early Mohawk String Beans \$1 per peck. Strawberries 12 to 17 cts. per box. Early White Dutch Turnips 12 cts. per bunch. Cherries 17 cts, per quart.

MISCELLANY.

From the Providence Patriot.

PRINTING OFFICE MELODIES. THE PRESSMAN.

Pull up, my boys, turn quick the rounce, And let the work begin , The world is pressing on without, And we must press within-And we who guide the public mind, Have influence far and wide, And all our deeds are good, although The devil's at our side.

Let fly the frisket now, my boys! Who are more proud than we? While wait the anxious crowd without, The force of power to see; So pull away-none are so great, As they who run the car; And who have dignity like those That practise at the bar.

And you who twirl the roller there, Be quick, you inky man; Old Time is rolling on himself, So beat him if you can; Be careful of the light and shade, Nor let the sheet grow pale; Be careful of the monky looks Of every head and tale.

Though high in office is our stand, And pi-ous is our case, We would not east a slur on those, Who fill our lower place; The gaping world is fed by us, Who retail knowledge here : By feeding that we feed ourselves, Nor deem our fare too dear.

Pull up, my boys, turn quick the rounce, And thus the chase we'll join; We have deposits in the bank, Our drawers are full of coin; And who should more genteelly cut A figure or a dash? Yet sometimes we who press so much, Ourselves are pressed for eash.

FIRST STEAMBOAT.

stances and meeting with innumerable obstacles, so- equal sum, for the fright that I have given you. licited Congress to aid him in his design, but scepticism and doubt prevailed over his solicitations, and after unwearied exertions, his first rude attempt was launched into the Delaware in the year 1798; his education had been imperfect, but his strong mind and habits of industry assisted him in perfecting his boat; the idea of wheels had not occurred to him, experiment was lested.

Fitch was regarded as an enthusiast and a visionary man, and many looked upon his attempt with ridicule and coldness, but his success, propinous thus far, was to be met with homiliating misfortunes; his Boat, completed with the most sanguine belief of its final success, sailed for Burlington, twenty miles from Philadelphia, and she approached the wharf, the Boiler burst! Chagrined and mortified, she was floated back to the latter city, and after unwearied efforts, a new Boiler was procured, and he again sailed for Burlington; but from some cause, she only made three miles an hour, and the expense of procoring other machinery being too great, his friends were discouraged, Fitch disheartened, and the enter-prise abandoned. The boat was left to rot at the

Thus it will be seen, that efforts of genius and enterprise, if unaccompanied by wealth, too often suffer and languish, and frequently are abandoned and lost to the world, from the scepticism of the public mind with regard to improvements and inventions of doubtful utility: Fitch, depressed in spirit, wearied with unappreciated exertion, and oppressed by creditors, was seized with the Yellow Fever, and died in 1793; he continued unshaken in his faith to the last, that steam boat navigation would finally be successful, and it was only from want of pecuniary resources, that he did not complete what was left for the triumphant genius of Fulton to accomplish. A friend has furnished us a little genealogical history of Fitch and his ancestors, which may be relied on as accurate: Joseph Fitch who settled early in Northampton, was great grandfather to John Fitch, the subject of the above notice, and projector of the first Steam Boat ; John's father lived in East Windsor, Conn. whose name was Joseph; he was second cousin to Thomas Fitch, Governor of Connecticut from 1754 to 1761. Ebenezer Fitch, who now resides in Hatfield, was first cousin to John, who would be 88 years old, if he was now living. So it appears, the first inventor of Steam Boats had his early origin in Northampton, and still has connexions living in the neighboring village of Hatfield .- N. Courier.

The Coar of Mail.—Just before Napoleon set out for Belgium, he sent to the cleverest artizan of his class in Paris, and demanded of him whether he would engage to make a coat of mail, to be worn under the ordinary dress, which should be absolutely bullet-proof: and that, if so, he might name his own price for such a work. The man engaged to make the desired object, if allowed proper time, and he named 15,000 francs as the price of it. The bargain was concluded and in due time the work was produced, and its maker honored with a second audience of the Emperor. 'Now,' said his Imperial Majesty, 'put it on.' The man did so. 'As I am to stake my life on its efficacy, you will, I suppose, have no objections to do the same.' And he took a brace of pistols, and prepared to discharge one of them at the breast of the astonished artiste. There was no retreating, however, and, half dead with fear he stood the fire, and, to the infinite credit of his work. with perfect impunity. But the Emperor was not content with one trial; he fired the second pistol at It may surprise many of our readers to learn, that the back of the trembling artist, and afterwards disthe first Steamboat which ever floated upon Amer-charged a fowling piece at another part of him with ican waters, originated, in its design and accomplish-similar effect. 'Well,' said the Emperor, 'you have ment, with a native of the Connecticut Valley. In produced a capital work, undoubtedly-what is to be 1785, John Fitch, a native of East Windsor, Conn. the price of it ? Eighteen thousand francs were conceived the design of applying steam-power to named as the agreed som. 'There is an order for propelling vessels, but being indigent in his circumthem,' said the Emperor, 'and here is another, for an

BRIEF CORRESPONDENCE .- 'Mr P.'s compliments assistance was denied; not being discouraged, he to Mr Q. and thinks it unnecessary his piggs should succeeded in forming a company in Philadelphia, and go through his ground. Whereupon Mr Q. replies thes :- 'Mr Q.'s compliments to Mr P. and thinks it onnecessary to spell pigs with two gees.

A boy about 12 years of age, son of Dr Paris, an eminent London physician, has obtained a medal but oars, working in frame were substituted, and his from the Society of Arts, for having modelled with a common stick of sealing wax, held before a lighted taper,-a greyhound in miniature, in perfect action, and with the most beautiful symmetry, a horse leaping a five-barred gate and a warrior onhorseback, in full vigor.

> To preserve Cheese from Miles. Red peppor, so called, is a complete antidote against flies impregnating cheese so as to produce maggets. Take one and put it in a delicate piece of linen, moisten it with a little fresh butter, and rub your cheese frequently. It not only gives a very fine color to your cheese but is so pungent that no fly will touch it .-Mass. Agr. Rep.

> will come and cut the halter.'

Valuable and Cheap Land-for Sale. The subscriber offers for sale, 14,000 acres of choi-Land, situated in the town of Pinckney, county of Lew

and state of New York. Some of the land is improvement under cultivation. The country is remarkably her thy, being entirely free from the fever and ague and fre the common bilious fevers which often afflict the tow upon Lake Ontario, this town being 18 miles east of t take. The soil is principally a sandy loam, much of covered with rich black monid. The timber is chief Sugar Maple, Black Ash, Butternut, Beech, Elm, & The land yields first rate crops of Grass, Rye, Oats, Ba ley, Potatoes and Flax; and on some lots, good Whe and Corn may be grown. To those wishing to obtain s perior grazing farms, a fine opportunity now offers itse The produce of pasturage and hay from an acre of the land, is very large, fully equalling if not surpassing the from the same quantity of land in any other of the Bla River townships. The land is admirably well waters there being but few lots which have not durable runni streams upon them. The land is well adapted to Orcha ing-the Apple tree thriving very well in this coun Stock of all kinds may be disposed of with the least pos ble trouble, and to the greatest advantage, the drov purchasing at the very doors of the farmers, and payi the highest cash prices for their cattle, which will read find purchasers at all seasons of the year. Several f mers at present residing on this town, were origina from the New England States, and some of them fr Massachusetts, who are in thriving circumstances. T above described land is offered for sale at the very l price of from two dollars and a half to three dollars aere, for the uncleared land, and from three dollars an half to five dollars and a half for the improved lots. T land will be sold in lots to suit purchasers, and from t to five years' eredit for payment, in annual instalmer will be given. As a further convenience to purchase the subscriber will receive in payment, Cattle, She Perk, Grain or Grass Seed, for which products he vallow the highest cash prices. The title to the landing the highest cash prices. The title to the landing the highest cash prices and possible purchases. BOSTON, WEDNESDAY EVENING, JUNE 22, 1831.

NO. 49.

Morticalture.

Society at an adjourned meeting, held in the apartments of the Institution, on Saturday, the 18th of June, 1831.

The following report was made by the committee on a Garden of Experiment and Rural Cemetery.

The Committee appointed to inquire into the expediency of measures being taken for the establishment of an Experimental Garden, and Ru-RAL CEMETERY, ask leave to

REPORT.

When the Massachusetts Horticultural Society was organised, it was confidently anticipated, that, at no very distant period a Garden of Experiment would be established in the vicinity of Boston; but to arrive at such a pleasing result, it was deemed expedient that our efforts should first be directed, to the accomplishment of objects, which would not require very extensive pecuniary resources; that we should proceed with great caution, and by a prudential management of our means, gradually develope a more complete and efficient system for rendering the institution, as extensively aseful, as it was necessary and important. Pubic favor was to be propitiated, by the adoption of such incipient measures, as were best calculated to encourage patronage and insure ultimate success.

With these views, the labors of the Society have seen confined to the collection and dissemination if intelligence, plants, scions, and seeds, in the arious departments of Horticulture. An exterive correspondence was therefore opened with imilar associations in this country, and Europe, s well as with many gentlemen, who were distinuished for their theoretical attainments, practical aformation and experimental researches, in all the ranches of rural economy, on this continent, nd other portions of the globe,

The kind disposition, which has been generally vinced, to advance the interests of the Society, as had a salutary and cheering influence. Many iteresting and instructive communications have een received, and valuable donations of books, eeds, and plants have been made by generous reigners, and citizens of the United States. A libral offer of co-operation has been promptly tenderd, in both hemispheres, and great advantages are nticipated, from a mutual interchange of good ffices.

A library of considerable extent has been form-1, containing many of the most celebrated lnglish and French works on horticulture, seveal of which are magnificent. The apartments or the accommodation of the Society, have been artially embellished with beautiful paintings, of ome of our choice native varieties of fruits; and y weekly exhibitions, during eight months of the ear, of fruits, flowers, and esculent vegetables; -by awarding premiums for proficiency in the art f gardening, and the rearing of new, valuable,

been excited, and a spirit of inquiry awakened, of industry. A confident reliance is therefore Proceedings of the Massachusetts Harticultural auspicious to the Institution, while a powerful reposed on the same sources of beneficence. The impulse has been given to all the branches of LEGISLATURE will not refuse its patronage, but rural industry, far beyond our most sanguine will readily unite with the Proper in generous hopes.

> useful and refined art of Gardening, the time ap- Commonwealth, and that of its citizens. pears to have arrived, for enlarging the sphere of action, and giving the most ample development improvement of horticulture in all its departments, to the original design of the Society.

The London, Paris, Edinburgh and Liverpool Horticultural associations, have each established Experimental Gardens, and the beneficial effects have been conspicuously experienced, not only throughout England, Scotland and France, but the whole civilized world is deriving advantages from those magnificent depositories, of the rarest products, which have been collected, from the vast domains of Pomona and Flora. These noble precedents have been followed, in Russia, Germany, Holland and Italy. We must also emulate the meritorious examples of those renowned institutions, and be thus enabled to reciprocate their favors, from like collections of useful and ornamental plants. 'An equally enlightened taste will be thus superinduced for those comforts and embellishments, and that intellectual enjoyment which the science and practice of horticulture afford.

With the Experimental Garnen, it is recommenbed to unite a RURAL CEMETERY; for the period is not distant, when all the burial grounds within the city will be closed, and others must be formed in the country,-the primitive and only proper location. There the dead may repose undisturbed, through countless ages. There can be formed a public place of sepulchre, where monuments can be creeted to our illustrious men, whose remains, thus far, have, unfortunately, been consigned to obscure and isolated tombs, instead of being collected within one common depository, where their great deeds might be perpetuated which leads to national glory and individual re- kind of tree and plant, that will flourish in this

to the cultivation of the soil. The intelligent, which will be highly creditable to the Society. patriotic and wealthy will cheerfully lend their

various products of horticulture, an interest has knowledge, and the advancement of all branches contributions, for the accomplishment of objects, To foster and extend a taste for the pleasant, so well calculated to elevate the character of the

> The Experimental Garden is intended, for the ornamental, as well as useful.

The objects which will chiefly claim attention, are, the collection and cultivation of common, improved, and new varieties of the different kinds of Fruits, Esculent Vegetables, Forest and Ornamental Trees and Shrubs, Flowering, Economical and other interesting Plants, which do not exclusively belong to the predial department of tillage; -paying particular attention to the qualities and habits of each ;-instituting comparative experiments, on the modes of culture, to which they are usually subjected, so as to attain a knowledge of the most useful, rare and beautiful speeies;-the best process of rearing and propagating them, by seeds, scions, buds, suckers, layers, and cuttings :- the most successful methods of insuring perfect and abundant crops, as well as satisfactory results, in all the branches of useful and ornamental planting, appertaining to Horri-CULTURE.

Compartments to be assigned for the particular cultivation of Fruit Trees, Timber Trees, Ornamental Trees, and Shrubs, Esculent_Vegetables, Flowers, and for the location of Green Houses. Stoves, Vineries, Orangeries, and Hot Beds.

For the accommodation of the Garden of Experiment and Cemetery, at least seventy acres of land are deemed necessary; and in making the selection of a site, it was very important that from forty to fifty acres should be well or partially covered with forest trees and shrubs, which could be appropriated for the latter establishment; and that it should present all possible varieties of soil, comand their memories cherished by succeeding gen- mon in the vicinity of Boston; -- be diversified by erations. Though dead, they would be eternal hills, valleys, plains, brooks, and low meadows, admonitors to the living, -teaching them the way, and bogs, so as to afford proper localities for every climate :- be near to some large stream or river ; When it is perceived what laudable efforts have and easy of access by land and water; but still

To realize these advantages it is proposed, that United States should long linger in the rear of a tract of land called Sweet Auburn, situated in the general march of improvement. They will Cambridge, should be purchased. As a large porhasten to present establishments, and to evince a tion of the ground is now covered with trees, zeal for the encouragement of rural economy, shrubs and wild flowering plants, avenues and commensurate with the extent and natural re- walks may be made through them, in such a sources of the country, and the variety of its soil manner, as to render the whole establishment interesting and beautiful, at a small expense, and Your Committee have not a doubt that an at- within a few years; and ultimately offer an examtempt should be made in this state to rival the ple of landscape or picturesque gardening, in conundertakings of other countries, in all that relates formity to the modern style of laying out grounds,

Besides the great public advantages, which will result, from the Horticultural departments, that portion of the land which may be consecrated to the dead, and rendered like the Elysian fields of the Egyptians, a holy and pleasant resort for the living, -the whole will present one of the most instructive, magnificent, and pleasant promenades in our country. From its immediate proximity to the Capital of the State, it will attract universal interest, and become a place of healthful, refreshing and agreeable resort, from early spring, until the close of antuma.

To accomplish these two great objects, it is necessary that a fund should be created, immedi--ately, sufficient for the purchase of the land, surrounding it with a substantial fence, the erection of a gardener's lodge, laying out the grounds, and proparing them for the purposes of an Experimental Garden and a Cemetery. That this can be be done, your committee does not entertain a doubt, and respectfully recommend the adoption of the following measures, as best calculated to insure success.

II. A. S. DEARBORN. For the Committee.

The Committee to whom was referred the method of raising subscriptions for the Experimental Garden and Cemetery, beg leave to

- 1. That it is expedient to purchase for a Garden To the President of the Mass. Hort. Society and Cemetery, a tract of land, commonly known by the name of Sweet Auburn, near the road leading a poor specimen of a Natural Cherry which is very from Cambridge to Watertown, containing about seventytwo acres, for the sum of six thousand dollars; provided this sum can be raised, in the Many of them where they originated are 44 feet or manner proposed, in the second article of this re- more in circumference, constant bearers; the season port.

> I am, dear Sir, very respectfully yours, E. W. Bull.

FLOWERS.

Fine Roses, from the gardens of Gen. Dearborn, Samuel Downer, of Dorchester, Mr Phipps, of Charlestown, Mr J. A. Kenrick, of Newton, and Mr Walker, of Roxbury.

A number of the varieties of Carnations from Mr Haggerston, of Charlestown.

The Roses exhibited by Mr J. A. Kenrick of Newton, at this and the last week's exhibition, were numerous and interesting; among them were the White, Blush and Red Moss, Provence, White Multiflora, York and Lancaster, and many dark Roses.

The Roses exhibited by Mr Downer were from bushes

WALL PROPERING FOR SPRING CROPS.

Has been often recommended. Doubtless it does well in many places. We have tried it till we are convinced it will not answer here. It materially impoverishes our land. I cannot tell why, but am satisfied of the fact.

Plymouth, Con. June 13, 1831. В,

PROLIFIC COW.

There is a cow in this town, owned by a Mr Jonathan Hall, but five years old this season, which has had nine calves; three when she was two years old, two when she was three years old, one when she was four, and three when she was five years old.

Plymouth, Con. June 13, 1831.

Comfortable Prospects for Charitable Societies and Alms-Houses,-The steamer Richelieu lately arrived at Montreal and Quebec with about 500 cmigrants; they quarrelled with some of the other passengers, and fought on landing: several persons where hurt with stones.

SINGULAR MANUFACTURES.

In Persia they have the art of carving spoons out of pear wood, which are so delicate and so thin, that the bowl of the spoon can be folded up like paper, and opened again. The handles are so slender. that it is a particular accomplishment to carry them, when full, to the mouth in such a dexterous manner as to prevent their breaking. These delicate utensils are one of the accompaniments of men of rank being used only by princes and nobles when sipping their sherbit.

In the province of Wiatkr, in Siberia, bowls and cups are made of the knobs which grow on the birch trees. They are yellow, marbled with brown veins, and when varnished are very pretty. Some of them are turned so very thin as to be semi-transparent; and when put into hot water they become so pliant that they may be spread out quite flat without injury, as they return to their original shape in drying,

A kind of rose-beads are made in Constantinople, which are so much prized by the Sultan's wives, that they are usually called Beads of the Haram, These poor ladies have so little emrloyment, that they sit for hoors, passing these bear s, when strung, through the rose carefully picked, and pounded into a smooth paste in an irea vessel, which turns them quite black, owing to, a small quantity of gallic acid contained in the ryse-leaves. When the paste is quite smooth, it is, made up into little balls, which are perforated for stringing, and then slowly dried in the shade. When hard, they are rubbed between the hands, vith otto of rose, till quite smooth. They always preserve their fragrance,

In No away there is a species of ants that build their habitations tour or five feet high, composed of decayed wood, bark, &c, filled up with earth. A bot'le half full of water is thrust into these ant-hills, ir to which the insects creep and are drowned; the contents of the bottle are then boiled, and a strong acid is produced, which the inhabitants use for vine, gar .- Bertha's Visit to her Uncle.

xtract from the Report of the Committee appointed by the Pennsylvania Horticultural Society, to examine and make a report on the present state of the Nurseries and Gardens is the neighborhood of Philadelphia:—

BARTRAM BOTANIC GARDEN AND NUR-SERY.

ROBERT CARR, Proprietor.

This Garden is situate on the west bank of the river Schuylkill, about 4 miles from Philadelphia. It was established as early as 1720, by that great vegetable naturalist, John Bartram, the elder, at a time when nothing of the kind existed in the then Colonies, except Dr Clayton's in Virginia. Here are concentrated very many of the indigenous plants and trees of North America, and in greater profusion, perhaps, than can be found elsewhere. Mr Bartram and his Sons were industriously employed in making this collection, for 100 years; so that in reference to out door plants, it must necessarily stand unrivalled. The present proprietor, is likewise adding annually and extensively, and the committee consider his garden and grounds as a rich deposit of the American Flora.

From this nursery many thousands of plants and seeds are exported every season to Europe and South America.

It is computed that there are 2000 species of our native productions, contained in a space of six acres. Plants of every size are to be seen here, from the minutest Marchantia to the loffiest Cypress. One of these (Cupressus disticha) is about 118 feet high, 25 feet in circumference and 91 years old. A young Norway spruce of 80 feet, stands close by; and also one of our native Magnolia, (M. acuminata) of the same height. Here too, is the Kentucky Coffee-tree. The Acaria Julibrissin, so beautiful in flower and graceful in form ; the fly-catcher (Diona muscipula,) &c.

On the south side of the garden is a field of 3 acres, preparing for a vineyard, as an addition to the one already planted. Mr Carr has 145 sorts of grapes, from some of which he has made very

good wine, for several years past.

The exotic department of this establishment is also very rich, consisting of 1900 varieties besides a splendid collection of more than 800 Camellias, containing 36 sorts. The Green-house and hothouses are 196 feet long, and much framing is in use. The largest Sago-palm that we have ever seen is here. The circumference of the foliage is 22 feet and of the stem 3 feet 4 inches. Some beautiful species of tropical productions may be enumerated, such as the Euphorbia heterophylla, with its large scarlet bracteas; Zamias, Pandanus, Marantas, Ficus, and a Testudinaria Elephantipes, supposed to be 150 years old; some curious species of Caetus, lately received from Mexico .-These last are astonishing productions, and new to us. A Lemon tree, from seed, is worthy of notice, on account of its easy propagation.

Mr Carr's Fruit nursery has been greatly improved, and will be enlarged mext spring to 12 acres : its present size, is eight. The trees are arranged in systematic order, and the walks well bruise those at the bottom. gravelled. The whole is abundantly stocked, from the seed bed to the tree. Here are to be found ped each in soft paper, and five shred paper be-113 varieties of apples, 72 of pears, 22 of cherries, tween the fruit and also the layers. 17 of apricots, 45 of plums, 29 of peaches, 5 of nectarines, 3 of almonds, 6 of quinces, 5 of mulberries, 6 of raspberries, 6 of currants, 5 of filberts, 8 of walnuts, 6 of strawberries, and two of medlars.

has, in the first class of ornamental trees, esteemed day all the fruit that is in it.

for their foliage, flowers or fruit, 76 sorts; of the second class, 56 sorts; of the third class 129 sorts, and of ornamental evergreens 52 sorts; of vines and creepers for covering walls and arbors, 35 varieties

Mr Carr who deserves so much credit for the classification of his nursery, is no less entitled to praise for the admirable order in which his toolhouse is kept: a place that in most gardens, instead of possessing regularity, is made a mere lamber room. The best order is likewise preserved in the seed room, in putting up our native seeds. That apartment, moreover, contains a library of upwards of 400 volumes, in which are all the late works on Botany and Horticulture,'

SAMUEL BRECK. Committee of EDWARD COLEMAN, Pennsulvania Hor-THOMAS HIBBERT, JOHN M'ARRAN, ticultural Society. GEORGE PEPPER, October 11th, 1830.

PRESERVING FRUITS

Ma Smith-A member of the Dublin (Ireland) Society, has presented me with the following method of preserving fruits of different kinds about twelve months, for which a premium of ten guineas was given by the Dublin Society, to Signor Ignacia Buonsegua. 1 am desirous of having it disseminated through the medium of your widely circulating paper. By so doing you will, as the proverb says, 'kill two birds with one stone,' as you will confer a favor on the public as well as on AMICUS ĤUMANI GENERIS.

It is necessary to pull the fruit two or three days before you begin the process.

Take care not to bruise the fruit, and to pull them before they are quite ripe.

Spread them on a table, over a little clean straw, to dry them; this is best done on a parlor floor, leaving the windows open to admit fresh air, so that all the moisture on the skin of the fruit may be perfectly dried away.

Pears and apples take three days-strawberries only twentyfour hours, these latter should be taken up on a silver three pronged fork, and the stalk cut off without touching them, as the least pressure will cause them to rot; take only the larggest and fairest fruit. This is the most tender and difficult fruit to preserve; but if done with attention will keep six months; there must not be more than one pound in one jar.

Choose a common earthen jar with a stopper of the same, which will fit close.

The years and apples then, sorted as before, must be wrapped up separately in soft wrapping paper, and twist it closely about the fruit, then lay clean straw at the bottom, and a layer of fruit; then a layer of straw, and so on until your vessel is full; but you must not put more than a dozen in each jar: if more their weight will

must be stored in the jar with fine shred paper, most which should be put into one jar; if they

Strawberries as well as peaches should have fine shred paper under and between them in the place of straw, which is only to be used for apples and pears. Put in the strawberries and the sorts; of honey suckles 30 sorts, and of roses 80 paper, layer by layer; when the jar is full put on the stopper, and have it well luted round, so as perfectly to keep out the air. A composition of rosin or grafting wax is best; let none of it get within side the jar, which is to be placed in a temperate cellar; but be sure you finish your process in the last quarter of the moon.

> Do not press the fruit, as any juice running out would spoil all below .- American Farmer.

> SWEET POTATO, -A new variety of this root grown in the forcing garden of Versailles, is thus noticed in the 30th No. of the Gardeners' Magazine-' A sort of Sweet Potato is grown here, obtained from St Domingo, and there called the "Quarantin," which as the name imports, produces tubers fit to eat in 40 days.' In a country like ours, where the Sweet Potato furnishes so large a portion of the food consumed both by man and animals, a variety like the one mentioned above would prove valuable, if it possesses any portion of the good qualities of those now grown by us. These last are not dug even for immediate use in less time than from 139 to 150 days. To a planter who has made a short crop of provisions, the Quarantin would be of great value. - Southern Agriculturist.

> Swiss Charp-mode of cooking. - The following directions for dressing this vegetable, have been politely furnished as by Mr G. B. Smith, to whom we are indebted for all the seeds we have distributed among our friends,-Editor So. Agr.

· We cook the Swiss Chard as follows - trim the leaf from the stem with a knife, and boil the stein in water with a little salt till tender, then take them out and drain all the water off, put them in a stew-pan, pour on some drawn butter, (sauce blanche, as the French call it) cover them close and stew them for 15 minutes. This dish is then equal (to my palate) to asparagus.

· The leaf part is cooked in the same way, and some cook the leaf and stem together, but I prefer them separately. Cooked thus the leaf is fully equal to spinach-to my palate of course. The French have various modes of dressing Swiss Chard, but I am unacquainted with any but the abuve."

COFFEE. -- Coffee was first introduced into England by Pasqua, a Greek, in 1652. It was originally brought from Arabia Felix; and its effect was discovered by a goatherd on his flock, which after browsing on the berry of this tree, would wake and caper all night,' Its first use was tried on the monks, to prevent their sleeping at matins.

Sick Peach Trees .- It was mentioned some time Peaches and apricots are best stored up wrap- since by a correspondent in the papers of this city that certain facts had lately come to his knowledge, which were stated, inducing the belief that powdered charcoal strewed about the roots of peach which will keep one from touching the other as trees, would be a great preservative against disease much as possible. Five or six bunches are the produced by insect, worms, &c. The Boston Courier corroborates the above opinion by his own exare large not so many; for it is to be understood perience: and adds that trees planted in burnt land The stock considered according to its growth, that whenever you open a jar, you must use that are universally healthy and free from worms at the root.

FIELDPATUS.

Fieldnaths are at this season particularly attractheir pleasant escapes from frequented places and track, winding away in easy curves along some make trial of the remedy. green slope to the church-yard-to the forest varm elastic sward and crimson dells-the chit- or heavy bread. ering of grasshoppers,-the foxglove, and the ur sweetest poetry, as stiles and footpaths? Goldnith, Thomson, and Milton have adorned them ith some of their richest wreaths. They have onsecrated them to poetry and love. It is along ie footpath in secluded fields, upon the stiles in the nbowered lane, where the wild rose and the oneysuckle are lavishing their beauty and their agrance, that we delight to picture to ourselves at the poet, seated, sends back his soul into the eshness of his youth, amongst attachments since thered by neglect, rendered painful by absence, broken by death; amongst dreams and aspirans which even now that they pronounce their n fallacy, are levely. It is there that he gazes the gorgeous sunset-the evening star following th its silvery lamp the fading day, or the moon owering her pale lustre through the balmy night , with a fancy that kindles and soars into the wens before him , there that we have all felt the arms of woods and green fields, and solitary ighs waving in the golden sunshine, or darkening, the melancholy beauty of evening shadows, to has not thought how beautiful was the sight a village congregation, pouring out from their gray church on a summer day, and streaming through the quiet meadows, in all directions, to ir homes? Or who that has visted Alpine nery, has not beheld with a poetic feeling the lit is offensive to God and ruinous to man. untaineers silently winding down out of their solitary heathtracks, bounding with elastic step lok of the Seasons.

RIDING FOR DYSPEPSIA.

As we said whilom that riding a hard trotting tive. I love our real old English footpaths. I horse was 'the sovereign'st thing i' the world' love those rustic and picturesque stiles opening for the Hyp, so we now take the liberty to declare that riding a gently-trotting or sweetly-cantering dusty highways into the solitudes of nature. It horse is the best thing in the world for Dyspepsia. is delightful to eatch a glimpse of one in the old. This may sound like a bold assertion, in the very village green, under the old elder-tree by some an- face and eyes of Mr Halstead's book; but we cient cottage, or half hidden by the overhanging repeat it, and if any dyspeptical reader of ours thrift in buisness .- They have clearly proved boughs of a wood. Hove to see the smooth, dry has any doubt on the subject, we advise him to

It is not the mere tossing up of the stomach grange, or to the embowered cottage. It is to me which is required; the whole system must be the conduct of those who have already become an object of certain inspiration; it seems to invite stirred along with it. The body must be invigorone from noise and publicity into the heart of soli-lated, the flagging spirits must be roused. The ude and of rural delight. It beckons the imagina- stomach is merely, as it were, a sort of vice-prestion on through green and whispering corn fields, ident of the system, and can do but little without through the short but verdant pasture; the flowing the aid of all the parts. If the body in general mowing grass; the odorous and sunny hay-field; he vigorous, there is little danger of the stomach the festivity of harvest; from lonely farm to farm, being weak. The whole must suffer, or enjoy, from village to village; by clear and mossy wells; together. When the body is strong and active, by tinkling brooks and deep wood-skirted streams, the stomach is lively and vigorous-ready to do o crofts where the daffodil is rejoicing in spring, its work, and prepared to digest everything that or meadows where the large blue geranium embel- the palate delights in, even though it be board ishes the summer way-side: to heaths with their mails, boiled cabbage, toasted cheese, hard eggs,

Exercise, in general, is to invigorate the body, ld guarled oak; in short, to all the solitary haunts and by that means to improve the stomach. But fter which the city-pent lover of nature pants as of all kinds of exercise, none is so efficacious as he hart panteth after the water brooks. What is riding on horseback. It stirs the system most jupere so truly English? What is so truly linked dictionally; it excites the bodily action without inith our rural tastes, our sweetest memories, and ducing any injurious fatigue. But wherefore use many words?

Make trial of the remedy, dyspeptics, whoever you are - we mean such as are in want of something more active than your ordinary exercise. Ride a few miles today, and see what effect it will produce. Ride again tomorrow in the same way, repeat it the next day; and in short, keep riding. There is pleasure as well as profit in it. eral lovers, breathing, in the dewy sweetness of But to have your stomach whipped and cuffed bemmer evening, yows still sweeter. There it is cause it is feeble and cannot execute its task, is unkind, is unjust. As well might you chastise a poor sickly boy, because he cannot perform the labor of a stout and hearty one.

Get you a gentle but spirited horse-borrow or buy-one that will trot easy, rack fairly, or canter judiciously. A thorough-going racker will stir you up most completely. But either kind will answer. Ride every day before dinner; ride ten or a dozen miles at a heat. Follow it up; and, depend upon it, you will dine agreeably, sleep comfortably, wake in the morning in better condition and spirits than you have been accustomed to do; and conclude, after all, that this world is not so bad as it might be .- N. Y. Const.

TEMPERANCE.

It is disgraceful to any Church, that its members should be concerned in the distillation, sale or use of this poisonous and demoralizing substance;

What should we say of a Christian, if such a nantic seclusion on a sabbath morning, pacing thing could be, who should spend his life in writing and disseminating infidel books, or in propavn the fern-clad dells, or along the course of a gating among his fellow citizens, libertine sentineighbors, or sow the seeds of mania or consump-Mammoth Dandelion. A dandelion weighing he would be far less criminal, would be far more conspirit.

Will not all our churches, of every denomination, consider this subject? The experiment has been made; our quaker brethren have set an example worthy the imitation of all. They have long prohibited both the traffic and consumption of ardent spirit in their society-and what is the consequence ?-They are distinguished all over the world for their sobriety, exemplary morals, and also that there is far less difficulty in maintaining rigid discipline, in the entire exclusion of ardent spirit, than in enforcing a loose one in regulating temperate. - Sewall's . Iddress.

DRINK WITH CAUTION, -Let those about to queuch their thirst, when overheated observe the following rules, and they may drink moderately with impunity.

- 1. Grasp the vessel out of which you are about to drink, for a minute or longer, with both your hands. This will abstract a portion of the heat from the body, and impart it at the same time to the cold liquor, provided the vessel be made of metal, glass or earth.
- 42. If you are not furnished with a cup, and are obliged to drink by bringing your mouth in comact with the stream which issues from a pump or spring, always wash your hands, previous to your drinking, with a little of the cold water. By receiving the shock of the water first upon those parts of the body, a portion of its heat is conveyed away, and the vital parts are thereby defended from the action of the cold.

GLUTTONS.

During the gluttonous days of the Roman Empire, once the most famous of their Epicurean dishes was called Trojanus. This consisted of an entire hog stuffed (as was the Trojan horse with armed men) full of larks, thrushes, capons, and other delicate birds, steeped in exquisite gravy made of the choicest wine and other costly materials. The expense of this dish was so enormous that it became the subject of a sumptuary law.

Another favorite dish of these 'architects of gluttons,' was formed of a hog presented entire, whereas one half was roasted and the other half boiled; and the whole was so cariously prepared by the cook that it was impossible to discover how the creature had been slain, nor yet how its interior came to be stuffed with sundry delicate things.

Mr Abijah Alley of Cincinnati has invented a beefiouse, which is highly approved. It has been patented by himself and Mr J, C. Parsons. It contains slides, by which the bees are shut off and the honey taken without disturbing them.

Let every farmer divide his pasture ground as he pleases. Let the fence between his arable and pasture land be as strong as an external fence. But, if possible, let all his arable ground, though it be a hundred acres, be in one lot. Then his plough runs clear, in a long furrow. His tillage is ous stream, as cheerful, as picturesque, and yet ments? Whatshould we think of him who should divided only by the different species of grain and solemn as the seenes around them ?-Howit's spread the small pox or yellow fever among his vegetables he cultivates. There are no fences of consequence, no inconvenient and worthless headtion—and this for the acquisition of wealth? Yet lands; no apology for thistles and nettles. The scene is beautiful to the eye. The whole has the sistent, than he who manufactures or yends ardent appearance of a garden, and begets in the farmer a sort of horticultural neatness .- Gardeners' Journal.

MAN ENGLAND PARMER.

BOSTON, WEDNESDAY EVENING, JUNE 99, 1831.

JENE.

In feeding cattle with green clover or turning them into a fresh clover pasture, great attention violent degree. But when otherwise the introducis necessary to prevent them from becoming tion of an instrument is proper and is now very swollen or hoven which is very apt to take place generally resorted to. The one principally in use when they are first out on this food, especially if is a species of probang, invented by Dr Munro, of it is wet with rain or dew. Caule are exposed to Edinburgh. Another, consisting of a cane of six this danger, whether they are sent to feed on clover feet in length, and of considerable diameter, havin a pasture or have it cut and brought to them; ing a bulbous knob of wood, has been invented by but there is less bazard in the latter than in the Eager, which is a more simple machine, but is former mode of using this grass, especially if the hardly so efficacious. It is probable that in cases plants are growing rapidly, and are very full of sap. of emergency, even the larger end of a common After being accustomed to this rich food for a few cart whip dexterously used might answer the end. days, during which it should be given radier spar-ingly the danger is much diminished; but it is cattle, as well as for clystering them, is Read's enema never safe to allow mileh cows in particular to eat apparatus, which is alike applicable to horses, large quantities of wet clover. The best mode of cattle and dogs. It consists of a syringe to which management, in many cases, is to turn cattle into a tubes of different kinds are applied, according to fresh clover field for about half an hour near the the purpose and the kind of animal to be operated middle of a fair day, and then turn them out of upon. There is a long flexible tube for giving an that field into a poorer pasture. The next day enema to horses and cartle, and a smaller one for the bailing, as it is called, may be repeated, and the dogs. To relieve hoven bullocks effectually it is cattle allowed to stay a little longer in the clover necessary not only to free the stomuch from an field, till at length they may be permitted to remain accumulation of gas, but from the fermenting in it during the day time, but as long as the grass mixture which generates it; for this purpose a retains any considerable degree of luxuriance, it tube is applied to the extremity of the syringe, will be safest to yard the eattle at night, and not and then passed into the animal's stomach through turn them into their clover pasture till the dew is the mouth, and being put in action, the offending off in the morning.

If however in consequence of negligence or accident, cattle or sheep are smollen or horen, or the stomach is rendered incapable of discharging its contents, a remedy must be speedily applied or the animal is lost. The usual remedy for this disorder has been to stab the animal with a penknife, or other sharn instrument under the short ribs, and put into the orifice a tube of ivory, elder, a goose quill, or something of the kind to give vent to the confined air. The wound in then dressed with some sort of adhesive plaster, and thus, in general the cure is easily effected. The following remedies are also recommended. 'Apply a dose of train oil, proportioned to the age and size of the animal. Give to an ox or cow a pint from a bottle, and rub the stomach well in order to make it go down, and give the animal exercise .- Furmers' Mag.

Make about a pint of lev either with hot embers thrown into a sufficient quantity of water, or by dissolving therein about an ounce of pot or pearl ash, and turn it down the throat of the ex or cow affect- animal has become outrageous, or the stemach so ed. A perpertionably less quantity will answer much distended with air that there is danger of for a sheep. This is said to give immediate relief immediate suffocation or bursting, the puncture by neutralizing the carbonic acid gas in the stom- of the maw must be instantly performed, which is ach of the animal, which causes the swelling and called paunching. This may be done with the other symptoms of the complaint to subside.

London says there are three modes of relieving this complaint, which may be adverted to according to the degree of distention, and length of time which it has existed. These are internal medicines; the introduction of a probang of some kind into the paunch by the throat; and the puncturing it by the sides. Dr Whyatt of Edinburgh, is said to have cured eighteen out of twenty hoved cows, by giving a pint of gin to each. Oil, by condensing the air has been successfully tried. the air is perfectly evacuated, and the paunch re-Any other substance also, that has a strong power of absorbing air, may be advantageously given; in whatever way it is done the wound should be common salt and water made strongly saline is carefully closed with sticking plaster or other. I shall be thankful to the chairman of that com-

a usual country remedy. New milk with a proportion of tar equal to one sixth of the milk the operation is so safe that whenever a medical is highly spoken of. A strong solution of prepared ammonia is water often brings off a great quantity FARMERS' AND GARDENERS' WORK FOR of air, and relieves the animal. Any of these internal remedies may be made use of when the hoven has recently taken place, and is not in a matter is discharged by a opening. When the same operation is performed on sheep a smaller tube is made use of. The characteristic excellency of Read's instrument is, that there is no limit to the quantity of fluid that may be injected or extracted. The same syringe is used for extracting poison from the stomach of man, for smoking insects, extinguishing fires, and syringing fruit trees. The introduction of any of these instruments may be effected by the help of an assistant, who should hold the horn of the animal with one hand and the dividing eartilage of the nose with the other, while the operator himself, taking the tongue in his left hand, employs his right in skilfully and carefully introducing the instrument; the assistant bringing the head and neck into such an attitude as to make the passage nearly straight, which will facilitate the operation. But when no instruments can be procured, or as cases may occur when indeed it is not advisable to try them, as when the disease has existed a considerable time, or the greatest case, midway between the ilimn, or haunch bone, and the last rib of the left side to which the haunch inclines; a sharp penknife is frequently used; and persons in veterinary practice should always keep a long trochar, which will be found much the most efficacious, and by far the most safe, as it permits the air escaping certainly and quickly, at the same time that it prevents its entrance into the cavity of the abdomen, which would occasion an equal distention. As soon as sumes its office the trochar may be removed; and,

adhesive matter. It is necessary to observe that assistant cannot be obtained, no person should hesitate a moment about doing it himself. After relief has been afforded by means of either the probang or of paunching, a stimulant drink may vet be very properly given, such as half a pint of common gin; or one ounce of spirit of bartshorn in a pint of ale, or two ounces of sprits of turpentine in ale, may any of them be used as an assistant stimulous.

Charcoal .-- The American Farmer says, the ravages of the yellow striped bug on cucumbers and melons may be effectually prevented by sifting charcoal dust over the plants. If repeated two or three times the plants will be entirely secure from annovance. There is in charcoal some property so obnoxious to those troublesome insects that they fly from it the instant it is applied.

Charcoal is not only used as an antidote against insects but is a valuable manure. Dr Deane stated that he had long ago observed where coal piles had been burnt, the ground has discovered a remarkable fertility for many years after and more especially when it has been a cold and wet soil. The dust of the coals and that of the burns turf have conspired to produce this effect. Being extremely porous, the pieces of coal imbibe much of the superfluous water, as well as increase the heat on the surface as all black substances do and when the weather becomes dry, they discharge the moisture, partly into the soil, when it grows dry enough to attract it, and partly into the air by the action of the sun upon it.

It is stated in the last American edition of Willich's Domestic Encyclopedia, vol. i. p. 655, that 'a friend of Dr Mease informed him, that some years since nearly all the cucumber and raelon vines in New Jersey were destroyed by a fly or bug. One day he had occasion to ride past a miserable but in the woods, and perceiving a very flourishing patch of cucumbers, he was induced to dismount and examine it. On approaching the spot he found it had formerly been a charcoal heap. He took the hint and by strewing charcoal round about the vines when they first come up, preserves his cucumbers effecmally.

A writer whose communication was originally published in the Transactions of the London Horticultural Society and republished in the New England Farmer, vol. vii. p. 354, recommends charcoal dust as a top dressing for onions and a cure for the clubbing in cabbages.

FOR THE NEW ENGLAND FARMER.

Mr Fessenben-I observed in the N. E. Farmer of the 15th inst, that the committee on fruits and fruit trees propose among other premiums for this year, one of twenty dollars, - For the best method of cultivating foreign grapes, in open ground, which shall be superior to any other now practised in this country with reference to planting, training, shelter, &c-and for a length of trellis, not less than thirty feet,'-The committee then add that 'they have hopes that the mode new universally acknowledged in France to be the best practised in that country for open enlure, may be successfully introduced into the United States;' that 'they allude to the Thomery method, a particular description of which may be found in the Bon Jardinier for 1830, &c.

mittee if he will answer the following questions in your next paper, as I may be induced to offer to one who is in pursuit of a premium, -- If the for the premium it I can be made to understand Committee want the experiment fairly and properthe purport of the proposition.

of twenty dollars for a Treatise on the best method of cultivating foreign grapes in the open ground, other than those now practised in this country; or do they intend that this premium shall be paid to the person who shall show by his own practice better mode of culture than any now in use here?

2d. If, as the committee seem to think, the Phomery method be the best now in use anywhere; do they mean to exclude this practice, should it be found on inquiry that it is now in sucessful operation, or rather progressing towards necessful operation in this neighborhood; and if ot, do they intend to pay the premium, when the rellis is partially filled, or wait until the whole be ompleted, and the advantage of this method e established over all other modes of open culture?

3d. If a treatise only is asked for, then the comittee can have no reference to the 'Thomery nethod,' as they have the 'Bon-Jardinier' before iem, in which that whole system is laid down. he question then is, will any method other than e Thomery, be satisfactory to the committeeat system baving been universally acknowledged France to be the best?

4th. If the Thomery method is to be considered open for the premium, and the condition of obining it is to be the completion of the experient, from the planting of the cuttings to the filig the trellis with fruit, I apprehend I must give all competition for it. I am somewhat adnced in life, and if I understand the method actised at Thomery, it cannot take less than six, it does less than seven years to complete a trelof eight feet square. It is true that a trellis of rty feet may be completed as soon as one of eight t, but as I have neither time nor money to ow away, I wish the chairman to explain the ention of the committee on these points before ngage in it?

These questions are intended to ascertain ether the Committee expects that any one will dertake to build and cover a trellis of thirty ated as the Bon Jardinier directs in all respects,

a premium of twenty dollars? If I were to undertake it, and were permitted tlive long enough to carry it through, it would t me in money, over and above my personal or, one hundred dollars, in lieu of twenty which Committee offer .- In the first place, to make experiment upon the system adopted at Thory, you must erect either a wall or a wooden ice on which to form your trellis :- in France Is are used -here a wooden fence might answer. Vext the cultivator must either own the soil, be sure that he will be permitted to remain on attend to the pruning of the vines from year ear, extending them six or seven inches only ry season, until they respectively arrive at their timed positions on the trellis .- If he is successfin bringing them to this point, agreeably to the es laid down in the Bon Jardinier-how can be sure, in such a climate as this, where we e to contend with mildew, frost, and fly, that lowill have a particle of fruit to show the comwee when they come to see whether he has fully and successfully worked out his seven rs' apprenticeship,

These are not unimportant questions, Mr Editor, ly made, let them offer a premium of one hundred 1. Do the committee propose to give a premium (dollars, and they will do a real good-and save some poor wight from spending that amount in pursuit of twenty.

Respectfully yours,

June 20, 1831,

Viris.

Hilliard and Brown have commenced a series called the Library of Old English Prose Writers, We are glad to see this. There is an abundance of vigorous thought, and quaintly beautiful expresion in these old wells of English undefiled ? and they have been to much neglected by the moderns. The 1st vol. contains Fuller's Holy State, with a preface and account of the author, by the Rev. Alexander Young, Jr. of this city,

Edinburgh Review .- The 105th No of this able and popular journal has just been republished by Lilly & Wait of this city, and contains elaborate articles on the fullowing subjects: Lingard's History of England-Causes tion. and Cure of Disturbances and Pauperism—Public Schools of England; Westminster and Eton-Schiller and Goethe-Reade's Poem :- Miller's History of the Dorians-Bulwer's Siamese Twins-Taylor's Historic Survey of German Poetry-Character and Authorship of the Epistolæ Obscurorum Virorum-Beechy's Voyage to the Pacific and Behring's Strait-Reform, and the Ministry -- Quarterly List of New Publications -- Published quarterly at \$5,00 per annum. STOREST STATE STATE OF THE PARTY OF THE PART

Acricultural.

The Trustees of the Worcester Agricultural Society re hereby notified, that a meeting of the Board will be held at the Probate Office in Worcester, on Thursday, the 23.1 day of June instant, at 4 o'clock, P. M., for the purpose of choosing an Orator, Chaplain, Committee of Arrangements, and Judges of Stock, &c, for the next Cattle Show; and also for the admission of members,

By order of the President. WILLIAM D. WHEELER, Rcc. Sec'ry. Woreester, June 8, 1831.

Farmer Wanted.

A permanent situation offers for a man who underlands farming generally, and a little of gardening, and who would feel an interest in his employar's business,to go on to a farm in one of the pleasantest towns in New t long according to the Thomery method, and England, or Connecticut river. Apply personally at the New England Farmer office.

Farm Wanted.

Wanted, a first rate Farm in the vicinity of Boston, containing 100 to 150 acres of land, with a good and convenient house, barn, &c.

Letters (postage paid) addressed to R. S. H. Salem, Mass, giving a particular description of Farms, offered, the market. eash price, taxes, &c, will receive immediate attention.

Wrought-Iron Ploughs. - Bar-Iron, &c. Wrought-Iron Ploughs, of all sizes .- Also, A Complete assortment of American, English, Swedes and Russia Bar Iron-American Braziers' Rods-Spike and Nail Rods, Shoe-Shapes-Hoop and Band Iron-Steel of all kinds-Pipe-box and Mould-board plates, &c. constantly for sale

GAY & BIRD, No. 44, India Street, Boston.

The true Sugar Beet.

For sale at the New England Seed Store, 52, North Market street, Boston, 100 lbs. of the true French Sugar Beet Seed,-received this day from Paris, by the last Havre packet, via Newport. The excellence of this toot for cattle, and for culinary and other purposes, is too well known to require comment.

Also-Large and Small Lima Beans-Early Dwarf Beans-several varieties of pickling and other Cucum-hers-Radishes, Lettuces, Cabbages, Turnips, &c. BROOM CORN.

Also, just received, a few bushels of prime Broom Corn raised last season in the vicinity of Connecticut river.

Lead Pipe.

LEAD PIPE, all sizes, constantly for sale by LINCOLN FEVRING & Co , No. 110, State Street. April 13, 1831.

Bones Wanted.

Shin and Leg Bones constantly purchased by GEO. H GRAV & CO. No. 68 Kilby street. April 20.

Brass Syringes.

For sale at the Agricultural Warehouse, Nos. 51 and 52 North Market street, a very useful article for destroying Caterpillars, Bugs and other insects. Likewise to prevent the mildew on Vines and Gooseberry Bushes .-See N. E. Parmer, vol. 8, page 358 and 363.

Sheep - Sheep.

Valuable Books on the hest method of forming good flocks, of increasing them, and treating them properly when in health and when diseased-on the character and value of Merino Sheep-anatomical structure, &c, &c-5 valuable works, viz:

Sir George Stewart Makenzie, Bart. Robert R Livingston, LL. D.

Samuel Bard, M. D.

M. Daubenton, a man of 1-tters, and profound Naturalist; his work was published in Germany, Italy, Spain, and America-and in France, at the expense of the na-

Mr Tessiu, inspector of the Rambouillet Establishment-and others in France.

Also for sale-a valuable collection of Books on Agricolling, Manures, various treatises on Horses, Cattle, Briany, &c., &c. By R. P. & C. WILLIAMS, whole-Buany, &c, &c. sale and retail Booksellers and Stationers, No. 18 and 20 Corphitt, Boston. May 25.

Howard's Cast Iron Ploughs, &c.

Just received at the Agricultural Warehouse, Nos. 51 and 52 North Market street, a few of C. Howard's Patent Cast Iron Ploug's. This is the mot approved Plough now in use, and is highly recommended by our best farmers for doing the work with ease and in the most perfeet manner; the easting being ground smooth, the Plough is not liable to clog even at the first time using, but runs perfectly free at all times.

Also .- Taft's superior east size! SCYTRES, manufactured expressly for this establishment. Likewise, Passmore's, Farwell's, Dudley's and English Scytles, with a large assortment of Garden tools

Also,-Hall's superior Hay Rakes-the best article of the kind manufactured in the country June 15.

For Sale, Full blood Allaernen and Short Horn Bull and Heifer Culves.

Two Alderney Bail Calves, and one Heif r Calf. Also, one Bull and two Heifer Calves of the Short Lorn or Teeswater breed, all from full bleed imported stock, on both sides. For terms apply at this office. 4t May 11.

BRIGHTON MARKET-Monday, June 20.

[Reported for the Chronicle and Patriot.]

At Market this day 331 Beef Cattle, including 75 unsold last week; 18 Cows and Calves, and 1206 Sheep and Lambs. 40 Beef Cattle, remained unsold at the close of

PRICES .- Beef Cattle-We shall quote to day from 4 50 to 5 25, extra at 5 33 a 5 50. We noticed some thin Steers taken at 4 a 4 50.

Cours and Calves-Sales were effected at \$15, 19, 24, 25 and 27,

Sheep and Lambs-Sales quick, we notice one lot at \$1.88, several at 2, one at 2.25, also at 2.33 a 2.374. We noticed the sale of a lot of wethers, sheared, it 2 33, also an extra lot sheared, at \$4.

New York Cattle Market, June 13-At Market this day between 3 and 400 head of Reef Cattle, from 250 to 300 Sheep and Lambs, a few lots of Swine and about 20 Milch Cows. Peef continues to be in good demand, and the price well sustained. We noticed several lots extra to be bought at \$8, several good 7 a 7.50, fair from 6 a 61 and middli g at 5½ a 5¾ per cwt. Sheep, the market is lively and sales effected at extra \$4, good 3 a 3½, tair 2 u 2½; and ordinary at 1,25 a 1,50 each, without the fleece. Swine selling quick at 3½ a 4½c. Milch Cows, several sales at 20, 25, and 30 each.

MISCELLANY.

DEPARTURE OF THE PIONEER.

Far away from the hill-side, the lake and the hamlet, The rock and the brook, and you meadow so gay; From the foot-path that winds by the side of the stream-

From his hut and the grave of his friend far away; He has gone where the footsteps of men never ventured, Where the glooms of the wild tangled forest are centred, Where no beam of the sun, or the sweet moon has entered.

No blood-hound has roused up the deer with his bay.

He has left the green valley for paths where the hison Roams through the prairies, and leapso'er the flood; Where the snake in the swamp sucks the deadliest poison,

And the cat of the mountain keeps watch for its food, But the leaf shall be greener, the sky shall be purer, The eyes shall be clearer, the rifle be surer, And stronger the arm of the fearless endurer,

wood.

Light be the heart of the poor, lonely wanderer, Firm be his step through each wearisome mile, Far from the cruel man, far from the plunderer, Far from the track of the mean and the vile. And when death, with the last of its terrors, assails him, And all but the last throb of memory I:il- him, He'll think of the friend, far away, who bewails him, And light up the cold touch of death with a smile.

And there shall the dew shed its sweetness and lustre, There for his pall shall the oak leaves be spread; The sweet briar shall bloom, and the wild grape shall

And o'er him the leaves of the ivy be shed. There shall they mix with the fern and the heather, There shall the young eagle shed its first teather, The wolves with their wild dogs shall lie there together And moan o'er the spot where the hunter is laid. BRAINARD.

EXTRAORDINARY LONGEVITY OF A NEGRO SLAVE. -Died at Maryland, St Andrew, the property of Sir Edward Hyde East, Bart, on Sunday the 5th December last, Robert Lynch, a negro slave in comfortable circumstances. He enjoyed almost uninterrupted good health until within a fortnight of his death, walking generally from his residence to the works of the property, about the distance of one mile and a quarter. This man perfectly recollected the great carthquake which nearly destroyed the town of Port Royal in 1692; and further, remembered the persons and equipages of the Lient, Governor Sir Henry Morgan, Knight, whose third and last governorship commenced in 1680. We shall allow for this early recollection, at all events, the age of 10, or 1652, (the end of this gentleman's reign, we may add to the present time), to prove the venerable old patriarch has been gathered to his fathers after having lived (during the reign of six kings and one Queen, and the administration of 23 governors, 27 heutenant governors, and seven Presidents,) to the age of 150 years,-Howitt's Seasons.

March of Intellect .- WANTS A SITUATION -A young woman who has received the rudiments of her education in a charity school, as house maid; she would prefer a place where the stairs are sent out to scour, and where she can carry on an epistolary correspondence with her friends, and where furniture-rubbing, washing and cleaning can be cannot expect to rate as a gentleman.

performed by proxy. Address, post paid, to Miss Amelia Caroline Ada Josephina Scroggs, Seven Dials. - London Paper.

Hints to Emigrants .- By felling the trees that cover the tops and sides of mountains, (says M Humboldt,) men in every climate prepare at once two calamities for future generations-the want of fuel and the scarcity of water,

The following description of a steed and out-rider taken from a very interesting work, called A Year in Spain, is a fair parallel to Rozinante and Sancho Panza:

After being detained a day longer at Aranjuez than I had contemplated, for want of conveyance, my little friend Jose at length procured me the means of reaching Toledo. In leed. I was just thinking of the expediency of departing afoot on the fourth day of my absence from Madrid, when Jose knocked at my door, and told me that he had got a horse for me, and that he was to go along, to bring him back on a borrico, (a jackass) Hiked this arrangement well. So, paying my bill, and packing ap Who trusts nought but heaven in his way through the my suck, I sallied out into the court-yard, to commence my journey. I did not expect to be very splendidly mounted, but my astonishment and confusion were indeed great, on finding that I had to ride upon a misera ble rocin, that had lost his hair by some disease, especially upon the tail, which was as long and as naked as the trunk of an elephant. The only tlesh the animal had left seemed to have descended into the legs, and as for his hips, his backbone and ribs, they were everywhere conspicuous, save where concealed by a huge pack saddle, stuffed with straw, and covered with What made the matter still worse, the master of the beast, an old man in a brown cloak, held his hand before me, as I was approaching to take a nearer view, and told me that if it was igual to me he would take the two dollars beforehand. I explained to the old man how very possible it was that his horse would not live to complete the journey; to which he replied, with some indignation, that he would carry me to las Indius, much more to Toledo. As he continued to hold out his hand with a resolute air, I dropped the required sum into it, and grasping the pack-saddle for want of a mane, I vaulted at once into the seat. The back of the poor animal cracked and twisted under the burthen, and as he gave some indications of a disposition to be down, I drew forcibly upon the halter. Thus roughly handled, his neck bent backward like a broken bow, and, making retrogade steps, he backed full upon Jose, who, well pleased with the idea of so long an excursion, was drawn up behind, upon a little mouse-colored ass, with a game-bag, which contained all my travelling equipage, hung round his neck, and hanging from his shoulder. Three or four sound blows from the cudgel of Jose, accompanied with a kick under the belly from the master of the beast, corrected his retrogade motion, which being changed for an advance, we sallied out of the inn, and took our way through the market place, to the admiration of all Aranjuez.'-vol ii. p. 15, 17.

> Gallant Daughter .- Sir John Cochrane, who was engaged in Argyle's rebellion against James the Second, was taken prisoner, after a desperate resistance, and condemned to be hanged. His daughter, having notice that the death-warrant was expected from London, attired herself in men's clothes, and twice attacked and robbed the mails between Belfor and Berwick. The execution was by this means delayed, till Sir John Cochrane's father, the Earl of Dundonald, succeeded in making interest with father Peter, a Jesuit, King James' Confessor, who, for the sum of five thousand pounds, interceded with his royal master, in favor of Sir John Cochrane, and procured his pardon.

When Lord Erskine made his debut at the bar, his agitation almost overcame him, and he was just going to sit down. 'At that moment,' said he, 'I thought I felt my little children tugging at my gown, and the idea roused me to an exertion of which I did not think myself capable.'

Legal Pun -As several gentlemen of the bar were a few days since in conversation, one of them, under favor of the wind, received a portion of his neighbor's saliva upon his summer coat. 'Mr. R-,' said the sufferer, 'if this is the way you treat other persons habits, you Valuable and Cheap Land—for Sale.

The subscriber offers for sale, 14,000 acres of choice Land, situated in the town of Pinckney, county of Lewis and state of New York. Some of the land is improved and under cultivation. The country is remarkably healthy, being entirely free from the fever and agge and from the common bilious fevers which often afflict the towns upon Lake Ontario, this town being 18 miles east of the The soil is principally a sandy loam, much of it covered with rich black mould. The timber is chiefly Sugar Maple, Black Ash, Butternut, Beech, Elm, &c The land yields first rate crops of Grass, Rye, Oats, Barley, Potatoes and Flax; and on some lots, good Wheat and Corn may be grown. To those wishing to obtain superior grazing farms, a fine opportunity now offers itself The produce of pasturage and hay from an acre of this land, is very large, fully equalling if not surpassing that from the same quantity of land in any other of the Black River townships. The land is admirably well watered there being but few lots which have not durable running streams upon them. The land is well adapted to Orcharding-the Apple tree thriving very well in this county Stock of all kinds may be disposed of with the least possible trouble, and to the greatest advantage, the drovers purchasing at the very doors of the farmers, and paying the highest cash prices for their cattle, which will readily find purchasers at all seasons of the year. Several far mers at present residing on this town, were originally from the New England States, and some of them from Massachusetts, who are in thriving circumstances. The above described land is offered for sale at the very low price of from two dollars and a half to three dollars per ere, for the uncleared land, and from three dollars and a half to five dollars and a half for the improved lots. The land will be sold in lots to suit purchasers, and from two to five years' credit for payment, in annual instalments will be given. As a further convenience to purchasers the subscriber will receive in payment, Cattle, Sheep Perk, Grain or Grass Seed, for which products he wil allow the highest cash prices. The title to the land I indisputable, and good Warranty Deeds will be given to purchasers. Persons desirous of purchasing will please to apply to the sub-criber, at Henderson Harbor, county of Jefferson, State of New York, or to DAVID CANFIELD Esq. on the town. JAMES II. HENDERSON. March 9.

Ammunition &

Of the best quality and towest prices, for sporting-constantly for sale at COPELAND'S POWDER STORE 6 · Broad Street.

N. B. It the quality is not found satisfactory, it may be returned, and the money will be refunded. If Jan. 7 Hickory.

This astonishing fleet horse was raised in Montreal, i from an English blood mare, (sire unknown,) is not in lerior to any in the U. States for speed, action and beau ty. He is a fine sorrel, well built, good size, and pro nonneed by (good) judges in every respect a first rate horse; trots a 3 minute gait, fast walker, and has paced around the trotting course, Long Island, in 2 minutes, 3seconds, and was offered publicly to match against any horse that could be produced. It is considered unnecessary to say more, as his qualifications are teo well knows to be doubted.

He will stand at Abbott's Inn, Holden, during the searon. Terms \$8, the season. May 11. 61

Published every Wednesday Evening, at \$3 per annum avable at the end of the year-but those who pay within sixty days from the time of subscribing, are entitled to a de duction of lifty cents.

No paper will be sent to a distance without payment being made in advance.

COMMUNICA TIONS.

FOR THE NEW EAGLAND FARMUR.

CULTURE OF INDIAN CORN.

Mr Fessenber, -- My remarks, published in your paper, No 36 of the current volume, not No. 33. obliged, like myself, to cultivate hilly, rough stony land, situated at a distance from rivers, sea shores, cannot readily be obtained.

best mode for farmers that occupy large level farms where manure is plenty. My principal object was to draw the attention of the middling class of farmers in the interior of New England who are obliged to till rough land, to the improvements made by those who are able and willing to try experiments and communicate the results for the benefit of others. Of this latter class, I consider Mr Phinney and Mr A. R. But most of our farmers on reading or hearing of successful experiments and improvements made by such firmers, at once object and say, 'this is nothing to us, inr lands cannot be managed as those gentlemen to theirs.' True my friends, but I would say o ou in the words of Mr R, not to be discouragel, consider what is the great object to be obtained, and see if you cannot some how obtain it. The reat object is to save and apply in the best posind the vegetable mould of the turf. They acomplish this by placing both manure and turf satisfied. ut of the reach of winds and sun, where they vill ferment and rot and nourish the corn when ie manner I described, nearly the same advantage eighbors persuaded me to persevere, and expethe outset, both as to labor and crops, I almost a better crop of ears? spaired of convincing any one, not accustomed it, to the contrary. But after reading and recting on Mr Phinney's experiment and success d considering the effect to be nearly the same both methods, I ventured to communicate my T. G. Fessenben, Esq. ws and experience, in hopes that some others ight be induced to give it a fair trial. Notonce ly, on a single rood of ground, but from year to ar, till they had fully tested the advantages, and sadvantages and learned by practice how to do the ork in the best and easiest manner, as every kind labor requires experience to make it perfect, and visable to plant any other than green sward th corn, I did not mean to give any opinion.

letting it lie in grass 3 years after, I can get good wounded. Very respectfully yours, crops of each, and at the end of the 5 years the as Mr A. R. has it, were intended for persons land will be in better order for another crop of corn, than it was when I commenced : by following this rotation continues to improve. When if ploughcities, or large towns, where plenty of manure ed 3 years in succession, as it must be or left in the hill, if any other than green sward were plant-I did not venture to hazard an opinion as to the ed with corn, it must be twice manured or become impoverished. Potatoes perhaps are a good preparation for corn, when the same land is intended for tillage several years; but in the country where we have no market for potatoes, except in our families and with our stock and of course plant more than ten acres of corn to one of potatoes, our corn land could not all be prepared in that way, and if so prepared, would need two successive manurings.

I feed my land close before ploughing for corn, because I find it easier ploughing and hoeing, the sward not being as tough and the grass not starting and growing as much before hoeing, and because experience has taught me that on my land with such a sward and such grass as it produces, it is better for the crop. No doubt on different soils a different course would be better. An observing neighboring farmer, first informed me, ble manner, the manure carried on to the land that he had found it best to feed close before flough-. I doubted it at first, but tried it and am

Mr. R. says my manure has been spread on the surface from before ploughing until hoeing and ne cars are setting and growing and thereby ren- thereby exposed to a great loss of virtue. He is er the greatest henciit to the crop. Our lands mistaken, for by ploughing into ridges as I stated ill not admit of turning over the turf and hav- at least four fifths of the manure is covered with ig it smooth and level, but I think by ridging in the furrows turned over for the ridges, and is collected and kept in the very place where and to ill be obtained. I knew it would be objected the very time when, it will do the most good, on y farmers not accustomed to this mode, that it the principle advocated by him and Mr Phinney, as four times the work to take care of corn that is, not to make a fine show of stalks but a anted in this way, to that done in the other, of good crop of large ears of corn. And it strikes oughing, harrowing, cross-ploughing &c .- I me that Mr Phinney has erred a little upon his own ought and said the same at first myself, but my principle, in putting on and spreading his manure after ploughing; would it not be better to spread ence has satisfied me that it is a saving of labor the manure before ploughing and cover it with ad better for the crops and the land. Being the forrows? It would not aid the corn in the fore nsible how discouraging this mode would appear part of the season as much, but would it not make

Plymouth, Conn. June 13th, 1831.

FOR THE NEW ENGLAND FARMER.

INSECT ON PEACH TREES.

The depredator deposits in the peach what shortly becomes a maggot. As I have never sufered much from their depredations until the prese all know that often what is hard and difficult int season, and am now in a fair way to lose all

I plant no other, because I wish to improve as formation I hope to receive through the medium much of my land as possible, with the least ex- of The New England Farmer. I have taken pense of manure, and I find by manuring and several of these creatures in the very act, and planting a piece of green sward one year, laying shall not have to call witnesses to prove them it down the next with oats and grass seed and guilty. I likewise send a peach, which they have

J. CRANSTON.

Remarks by the Editor .- We believe the insect referred to in the above communication is the great enemy to fruit for whose destruction premiums have been proposed, and a Report of a committee of the Mass, Hort, Soc. relative to means of pregenting its ravages was published in the New England Farmer, vol. viii, p. 382. It is a small bug or beetle, which perforates the young fruit of the pear, apple, and all stone fruits and deposits its eggs in them. These soon batch and a small magget is produced, which feeds either on the pulp of the fruits, or on the kernel of the seed; for the tastes and habits of the different species are not similar. In the stone fruits this injury destroys their growth, and they fall with their little enemy within them. The insect retreats into the earth, passes the winter in the chrysalis state, and comes forth just as the young fruit is forming or the petals of the flowers are falling, to renew its mischievous labors and continues its depredations from the tirst of May till autumn.

Dr James Tilton of Delaware in an article on this subject published in the American edition of Willich's Domestic Encyclopedia, and republished in in the N. E. Farmer, vol. ii. p. 69, observes that Our fruits, colle-avely estimated, must thereby he depreciated more than half their value;' and adds in his directions for destroying the insect, 'All the domestic animals, if well directed, contribute to this purpose. Hogs in a special minner are qualified for the work of extermination. In large orchards, care should be taken that the stock of hogs is sufficient to eat up all the early fruit, which falls from May till August. This precaution will be more especially necessary in large peach orchards; for otherwise, when the logs become clogged with the pulp of the peach, they will let it fall out of their mouths, and content themselves with the kernel, which they like better; and thus the curculio, escaping from their jaws may hide under ground till next spring.

'The ordinary fowls of a farm yard are great devourers of beetles. Poultry in general are regarded as carniverous in the summer and therefore should be cooped some time before they are eaten. Everybody knows with what avidity ducks seize on the tumble-bug, (Scarabous carnifex) and it is probable the curculio is regarded by all fowls, as an equally delicious morsel. Therefore it is that the smooth stone fruit, particularly succeed much better in lanes and yards, where poultry run without restraint than in gardens and other inclosures, where fowls are excluded.'

Dr Thacher remarks of this insect, that instead of retreating into the earth, a part of the worms, at least abandon the upple before it falls from the tree, and locate themselves under the scales of the bark and in the crevices of trees. In making first, becomes easy by habit. As to its being ny crop, I feel desirous to be made acquainted search this day, 25th September, I have detected with the name of the insect, and the time and a considerable number of apple worms, in that means of preventing its depredations; which in condition, entirely secure from the weather. This applications to trees both in the fall and spring for the destruction of insects. All the rough bark should be carefully removed, and the trunk and large branches should be thoroughly washed with Forsyth's composition, or a strong decoction of Mr Fessenden, to the mode of cultivating early potobacco, with a small quantity of quick lime, which should be applied to every crevice which can afford shelter for insects or their eggs.' Thacher's Orchardist, p. 116, 2d ed.

In the autumn of 1828 we addressed a letter on the subject of this insect, to a gentleman, who was often benefitted the public, and obliged us by communications on entomology. This gentleman favored us with a scientific description of the eurculio, which was dated Milton, Oct. 1, 1828, and published in the New England Farmer, vol. vii. p. 81, 82. From this it appears that some broods of the same insect attack the limbs, and cause dark colored bunches or excrescences, and other broods assail the fruit. The remedies which this gentleman recommended were

· 1. To extirpate the diseased nodes or excrescences in June, and burn them.

· 2. To collect all fallen stone fruit, and give it to hogs:

'To which may be added that the fruit should not be suffered to remain long on the ground; that it should be boiled or steamed in order effectually to destroy the centained larvae; and that the above processes should be universally adopted in order to exterminate the destructive insect.'

FOR THE NEW ENGLAND FARMER.

PRESERVATION OF SWEET POTATOES, APPLES, SQUASHES, &c.

MR FESSENGEN-Many experiments having been tried in the vicinity of Boston to preserve the sweet Potato slips through the winter without success, I have thought the following obscrvations may be acceptable to some of your discovered to my disappointment, that they were readers.

After digging my sweet potatoes last fall, I packed a quantity of the slips down in a barrel with waste cotton, such as is obtained at the cotton factories for making into coarse paper and batting, (at 2 ets. per lb.) with a layer of cotton and a layer of slips alternately, and then placed them away in a warm room, which we keep from freezing during the winter. On opening them in the spring, I found a part of them very fresh; but where they were too thick, they had created too much dampness and rotted. I also packed down two barrels of apples in the like manner, and found them in the spring much better preserved than any I ever before saw. I am informed that the flavor. But here is a difficulty to which a large New Jersey Quakers preserve their potato slips proportion of our city friends will be obliged to in leaves. As the cultivation of the sweet potato, is new becoming so general in this quarter, I to keep the seed without having to get them from New Jersey every spring. And I feel confident the one given above will be successful. I am away, much of the richness of the pea is wasted also inclined to think, that ground plaster, as was mentioned in your 48th number, will answer this purpose.

I believe it is not so generally known as it ought to be, how to keep winter squashes, almost to boil the peas, calculating by the way, to retain any length of time wanted; you have only to hang just enough of the salt of the pork (with the them up in a warm dry room. I have them now perfectly fresh, and their flavor as good, or bet-the peas. ter than when they were taken from the vines.

circumstance shows the great utility of proper Any room where they will keep dry and warm through the winter, will preserve them. One may be seen in Mr Shepherd's bar room, at Concord, perfeetly sound, which grew in 1829, and many of last year's growth. I will also call your attention, tatoes in Denbighshire, Eng. found in Loudon's Gardener's Mag. vol. ii. pp. 171, and pp. 317; and I for one should be glad if you will give the substance of those two articles, in the New England Farmer, at your leisure, as the Magazine is in the Hort. Society's library, you can refer to it at EDWARD CURTIS. leisure. Yours &c. Pepperell, June 21, 1831.

> P. S. If any members of the Horticultural Society wish for any seeds or seions from Montreal or Quebee, and will make it known to me, through you, I will make arrangements for obtaining them at the proper seasons, as I shall spend the summer at those places. E. Curtis.

> > FOR THE NEW ENGLAND FARMER.

GREEN PEAS.

Mr. Fessenden-After having taken pains to procure seed of the best varieties of vegetables, and been to the trouble to cultivate them too, it is very vexations to have them either spoiled in cooking, or by any other means impaired in goodness, or flavor.

I am induced to make these remarks from my own experience, and if it should add to the comfort of any individual, my object will be realised.

Last spring at the proper time to plant early peas, it was inconvenient for me to attend to the business, therefore I said to myself, I will plant no early peas this year, but depend on the market for the early, and when convenient, plant some for later use. Accordingly when the market began to abound with peas, I procured a messthey were dressed in the manner usually practised in my family; but when I came to cat thereof I destitute of all the good qualities of the pea.-I made up my mind at once to do without peas until my own were fit for use .- In the meantime I dined at an inn, where peas were served, they also possessed but little merit-but today I have had a real feast on green peas, which were gathered in my own garden, about two hours before

Now I will come to the point, and say what I might (but for a desire to be particular) have said at the beginning.

Green peas lose their sweetness very fast by remaining on hand after they are gathered; even one night is sufficient to extract much of their submit.-A word on cooking and I come to a close. -Green peas should be boiled with a little salt, hope and trust there will be some mode discovered in a very small quantity of water, so that no more liquor should remain when done, than is needed in the dish-for if a quantity of liquor is thrown

Another way of proceeding, which is probably as good or even better, is to take a piece of sal pork, and half boil it in a large quantity of water and then, pour off until you have just enough lef help of the butter that may be used,) to season A RUSTIC,

Neuton, June 24th, 1831.

FOR THE NEW ENGLAND PARMER.

Description of a Method for propagating Fruit Trees, and Forest Trees, not as yet, generally practised in Europe, or the United States .- The account of the method here in question is taken from the Philadelphia Medical Museum, published by Dr John Redman Coxe, vol. vi. p. 165,* Similar accounts are to secu in Sir George Staunton's Relation of Lord Macartney's Embassy to China, and other publications. Its familiarity to the Chinese is known from their introducing fruit trees, formed in this manner, into their deserts. The statement is the rather borrowed however, from Dr Howison's report, as he practised the method himself, and suggests the propriety of using it to other trees, not bearing fruit, when they do not produce seed in the country where they are cultivat-

Of the Chinese Method of propagating Fruit Trees by Abscission. By Dr James Howison .- 'It is said the Chinese do not raise fruit trees from seeds or grafts, as is customary in Europe, but in the following method. They select a tree which tney wish to propagate, and fix upon a bunch, waich will disfigure it the least by the removal; and round this, as near as conveniently it may be to its junction with the trunk, they wind a cord made of straw, besmeared with cow dung, until a ball is formed five or six times the diameter of the branch. This is intended as a bed into which young roots mry shoot. Immediately under the ball the bark is divided down to the wood for nearly two thirds of the circumference of the branch. A cocoa nat shell, or a small pot is then hung over the bill, with a hole in the bottom; so small that water therein will only fall in drops; by which means the rope is constantly kept moist; a circumstance necessary for the ready admission of the young roots, and for the supply of nourishment to the branch.

When the vessel has been supplied with water for three weeks, one third of the remaining branch is cut; and the former incision carried deeper into the branch, as by this time roots have struck into the rope, and assist in giving support.

After a similar interval, the operation is again repeated; and in about two months from the commencement of the process, the roots are generally seen intersecting each other on the surface of the hall; which indicates that they are sufficiently advanced to admit of the separation of the branch from the tree, -And this is best done by sawing it off at the incision; taking care that the rope, (which must have become nearly rotten) is not shaken by the operation ;- and then the branch is planted as a young tree.

'It is conceived that a longer period would be necessary to succeed with this operation in Europe, because vegetation is so much slower than in India (where Dr Howison made his experiments;) but he thinks that an additional month would be adequate to make up for deficiency of

'The advantages of this method are stated to be, that a farther growth of three or four years, is sufficient, when the branches are of any considerable size, to bring them to their full bearing state; whereas eight or ten years would be otherwise necessary. This he saw proved at Prince

^{*} Dr. Coxe copied the above from the London Retrospect, which took it from Trans. Soc. Arts. in London vol vyv.

and Java.1

· The writer's experience does not allow him to speak of the success with which this method might be applied to finit trees; but he little doubts of its succeeding; and the adoption of it is recommended at all events in multiplying such plants, natives of warmer climates, whose seeds do not succeed in this country.

'Dr Howison has besides frequently remarked; the operation of abscission at the time of bearing, were more laden with fruit, than the rest of the trees, which is attributed to a plethora or fulness, occasioned by the communication between the branches and the trunk being cut off by the division of the bark. And he has observed that the roots from a branch under this operation were longer in shooting into the ball of straw, when the tree was in leaf than at another time: -on which account he recommends the spring as the best season for making experiments.'

The quotation from the American Museum here concludes.

It is proper to add, that though the division as to the bough which is to form the new tree, should be made at the place above directed, yet care must be taken not to leave a stump behind on the parent tree, for this would damage the stock for the sake of the new tree. The stump, therefore, must next be cut off close to the main branch, from which it was taken; that the wound may heal by bark spreading to cover the wound from the right and left, and from above the wound; not to speak of some little elevation of bark, which may arise from below the wound. The bark, it must be observed will never rise up and cross the end of a standing stump, but must be looked for as a cover to the branch out of which the stump grew.

> I am, Sir, yours, A. B. FOR THE NEW ENGLAND FARMER.

MR FESSENDEN-A correspondent in your paper of the 22d inst, over the signature of 'Vitis,' has undertaken to animadvert upon the committee on fruits, for their proposal to give a premium of twenty dollars, ' For the best method of cultivating foreign grapes, in open ground, which shall be superior to any other now practised in this country, with reference to planting, training, shelter, &c, and for a length of trellis not less than thirty feet? to which he has appended some strictures upon the Thomery method.

The first difficulty he seems to meet with is whether the premium proposed be for the theory or practice of cultivation and in his question which vation than is now in use.' It is not easy to imagine how any one can fairly give any other than the latter construction to it; is it not explicitly stated to be for the best method of cultivating which shall be found to be superior on comparison with others now practised, and is not the trellis for the specimen required to be of a given length? Has this anything to do with a treatise? But your correspondent has solved his own difficulty; he says they have the Bon Jardinier before them, in which ment for his laudable efforts. that whole system is laid down; this is very true and

method the consequent conclusion would be that Thomery method in which he says, extending they did not want a treatise,

As to the several inquiries in relation to what would be the conduct of the committee in certain contingencies, I cannot take upon myself to determine. I understand their proposal, according to its evident import on its face, to apply to any new method which shall be superior to what is now practised, and I doubt not their award would be that such branches of fruit trees, as were under made in conformity to it, whenever it was convinced the claimant was entitled to it. I do not understand them to say they think the Thomery mode to be the best in use any where, but that it is acknowledged in France to be the best in use there, and of this I believe there is no doubt. I acknowledge that I was pleased with the proposal of the Committee; not that the sum of twenty dollars was much to offer; but it was a small step towards some improvement in the old fashioned mode, which like our first foreign vines, was imported from England many years ago, and which we have been practising upon ever since, with what success, generally, I can appeal to many of our most respectable cultivators in this vicinity to determine. It is well known that several of them, notwithstanding they have with great care, made use of the required precaution of syringes and washes, lime and sulphur, flying tents and fumigators, have threatened to abandon their vines altogether; yet there are some individuals so orthodox in their faith in this mode; arising perhaps from a greater share of success, in perhaps very favored situations; or from an untiring zeal and a disregard of expense; that if they hear the Thomery mode mentioned they seent heresy in the gale and seem determined to decry it at once, and pertinaciously to adhere to a system taken from a country where it never did succeed for open ground culture, instead of essaving another mode received from a country where it inv riably has succeeded for the same culture. You are not furnished with any conclusive reasons for resisting the new mode, but you hear, that it will require six or seven years to complete a trellis; time and money are not to be thrown away; it will cost a great deal, you are not sure it will succeed in this climate, a cultivator must own the soil. I confess, Sir, I do not see much force in these objections which does not apply to the ordinary mode, and if a substantial, coarse wooden fence, built upon red cedar posts with a decent trellis attached to it, and furnished with the coping, can be constructed of thirty feet in length and of the requisite height for ten dollars, and I am assured by an experienced earpenter that it can, I do not see why one hundred dollars need be expended upon it; this fence according to usual wear he formally marks No. I, he inquires, whether it would last for twenty years, a term of durability, be for a treatise or to be paid to the person who shall three times as great as your correspondent will ven- growing. show by his own practice a better mode of culti- ture any calculations upon about grapes, at all: neither do I see the pertinency of the remark that if the committee had offered a premium of one hundred dollars, they would have done a real good. Consistent with the implied censure of the offer of twenty dollars for the same object, the amount would not be intended to repay the expenses of the experiment, and your correspondent's 'poor wight,' if he failed of success, would in either case have to sustain the whole loss of it himself, and if a treatise only is asked for, then the committee if he succeeded, his success itself would be his own prevent their ascending. can have no reference to the Thomery method, as reward, and the premium simply an acknowledg-

CUTTING TREES FOR REPRODUCTION.

Ma Fessenden .- In a communication from Mr Welles recently published in your paper, it is intimated that suckers do not grow from the stumps of large trees when cut, because the stumps having been left hollow contain water. He supposes that if the trees were so cut as to prevent this, by letting the water run off, suckers would sprout forth and grow. For the last 20 winters it has been my employment to cut timber. The result of some of my observations on its growth I will state. For a number of these years the trees that I was cutting, were very old and much decayed; I observed that no suckers started from the stumps of large trees when cut.

In the winter of 1823, I began to cut a lot of white oak, full grown, but undecayed-not one in the hundred unsound, the stumps generally perfeetly sound,-diameter from 18 to 36 inches,

This lot being secure from cattle I expected a fine growth, but on examining the stumps the following summer I could not find a single sprout.

Supposing this might have resulted from the stumps being cut very low, and considerably hollowing so as to contain several gallons of water, I determined to adopt a different mode of cutting. Accordingly, in the following winter, with an axe, I ent the sap wood all around the tree, leaving it the lowest on the outsides, I then sawed the remainder with a cross-cut saw-the teeth so raised as to leave the stump in a form to shed off all the water. By way of experiment I cut a number of trees in the usual way. This course I followed two seasons, but no advantage resulted as to the growth of wood.

Since then I have consulted my own convenience rather than the growth of suckers in cutting my timber.

After reading Mr Welles' communication on the subject, I examined rising a hundred of the stumps cut in a manner to secure the growth of suckers and have not found so much as a single sprout

If this be worthy a place in your valuable paper, you may publish it.

Yours, &c. I. Alden, 2d. East Bridgewater, May 14th, 1831.

CHARRING POSTS.

'The proper time for felling trees for posts or timber, is in August. Whatever is thus cut should be left to season for a year and then taken to the sawmill. When sawed in suitable pieces, each piece should be charred at the bottom just so far as it is to be sunk in the ground. Posts, cut and charred in this way, will last for twenty years; but unless the wood is cut in August, and seasoned for a year in some dry place, it is worse than useless to charthem. It has been ascertained that when unseasoned timber is charred, the 10t takes place much sooner than if left without char-The timber from full grown trees lasts longer than that from young saplings; even the limb of an old white oak will be of longer duration as a post, than one of the same size of a young one.1

The construction of the barn on the writer's farm cannot fail of being read with interest by

'Luckily for you, I have an immense barn made entirely of stone, with a slate roof. It is certainly one of the most complete things I ever saw. It stands on the brow of a knoll, or rather of a slope. The cellar of the stable part of the barn is forty feet by thirty, and about eight feet in height, over this cellar are the horses and cows, stalls, which are arranged on each side of the stable. There is room for eight horses and ten cows at present, but by a little ingenuity, and Mr Grant has already suggested the plan, there can be room made for four horses and four cows more, as the space in the centre is a mere waste. which when raised, allows all the litter of the year, have convinced me of the propriety of this stable to be shovelled down to the cellar. You can easily imagine how clean and wholesome a stall can be kept in this way, and how much more horse and cow stables should be built over a cellar of this kind, that the animals may be kept from breathing the foul air. Many of the diseases of cattle proceed from the impure atmosphere of stables,'

·1 took out of the cellar, soon after 1 bought the farm, at least one hundred wagon loads of rotted manure. It had lain there a long time, the made for it, as no experiment was intended. It owner not caring to disturb it. I shall in future has survived the fly, and the last severe winer, take out the manure every spring and fall. The with little injury, but not more than one third of barn, or rather that part of the barn which is the adjoining wheat has been left alive. From its appropriated to hay and grain, is of the same present appearance, it will produce, I believe, two dimensions, with a cellar also, under the whole, thirds more than its adjacent neighbor. divided from the other by a strong stone partition. This cellar is for calves, and wagons, and woodsleds, &c. A wide bridge, or causeway, from the previous years, seed wheat has been kept by me barn door to the level below, makes an easy road in bags, and no similar result has taken place; my for ascending and descending wagons. Nothing inference thence, is, that this difference must be can be easier than to get at the manure below, for owing to the entire ripeness of the seed. Should the floor, which is of stone, is on a line or level any reader of this communication, have doubts on prefer the evening-but either will answer, and the with the ground, and by backing in the wagons this subject, it would give me great pleasure to trouble attending is not greater than that of hiving they can be easily filled. healthy, while the branches are unsound; but limost entire success. never saw the the body of a peach tree look healthy, and have unsound roots. The peach tree very soon exhausts the soil, for it abstracts nourishment from it with greater rapidity than almost any other tree; it would be an easy matter, theretore, to prolong its life, and insure its health by formishing it with a sufficiency of food, were not the fact known to us that too much manure is injurious, unless we can supply it abundantly with water. During what is called a wet season here, the peach trees revive from a very languid state; and were the moist summers to continue, this fruit tree would live to a good age. You have no idea of the rapid growth of a peach tree, and how soon, when the trees are fifteen feet apart the roots meet one another. Mr Thorn bared the roots of two trees for my inspection, which were fifteen feet asunder, and I saw they had actually met. Now this fact proves that we do very wrong in ploughing deep among peach trees, for the roots are seriously injured by it. A braised root affects the health of a tree; but if we cut the root with a knife, no harm ensues, unless we cut off too much, or too many roots. It is just like the tendon of an animal; if we wound it, we often destroy life; but if we separate it entirely, the injury we do is only local."

ON REAPING WHEAT.

JOHN TAYLOR.

Liberty Hill, Carolina.

ON THE MANAGEMENT OF BEES. Most people are fond of honey, and many are

also foul of bestowing upon Bees those cares which seem neccessary to render them the most profitable. One of the most troublesome parts of the management of these republicans, is the time when, from an over population, like the New England States, they see fit to emigrate or swarm, as the time which they select for this, is not always the most convenient for the farmer to attend to them. Now it is with this, as with other business of agriculture; it should be done in proper season, and when it will best suit the convenience of the superintendent. As to the prosperity of the bees it is altogether indifferent whether they fix upon the time of emigration or whether the hushandman does, so that he uses judgment in the matter. If he finds in the month of May or June that any of his hives are over-stocked with bees, he should remove them into another, which, if repeated as often as the old hive becomes over-stocked will prevent their swarming at all. Swarms separated from the parent hive in this way, do equally as well as when left to fly out and separate themselves, beside much time and loss of honey is saved: for when a hive becomes over-stocked, the major part of the bees which constitute afterwards the new swarm, do not work at all, but live upon the honey produced by the old and more industrious part of community, and the quicker they are taken off after their number is sufficient to form a well regulated republic, the better.

For doing this let the old hive be turned bottom upwards, and the new hive set upon it; strike lightly upon the lower hive, and many of the bees will ascend into the upper hive; when a sufficient number has collected in the new hive for a swarm, take it off and set it upon the bench, and return the old one to its former position. In doing this to insure success, it is necessary that one of the queens should accompany the new swarm, which may be known in the course of a day or two; fer if they have no queen, they will not stay in the new hive, but will return to the old one; but if they have a queen, some of the bees may be seen in the course of twentyfour bours, standing near the entrance into the hive, amusing themselves by Can the keeping in the bag be the cause of this raising their bodies to the full length of their legs, steady buzzing noise. This may be considered as an indication of their satisfaction and the success of the operation. Some consider mid-day, the most favorable time for doing this; others again, the common manner, and the danger of having removed to a moist soil, the trees recovered. I'd my opinion, by stating to me the same practice will give them more satisfactory evidence, either

for or against the practice, than all that can be written on the subject. The present price of bees in this section of country, we believe to be about five dollars for a good hive in the spring; such as will give on an average, two swarms during the summer. This, after deducting for the trouble of the taking care of them, is a great profit, Each hive of bees that are in good condition in the spring, will make enough honey over their own wants, to pay well for taking care of them, and leaving a profit of two hundred per cent. Now if this can be realized, what better business can a farmer ask for? Surely we have a land 'flowing with milk and honey.'- Genesce Farmer,

ARACACHA AND QUINOA .- The Editor of the American Farmer says the present appearance of these new vegetables in his grounds is highly flattering. The Aracacha is growing finely, notwithstanding the irregular weather; and, so far appears to be as well adapted to the climate as parsmips. One plant has already a few seed set. Many of the Quinoa are a foot high, and all are growcame up May 20th. It resembles closely, and is a near relative to a weed commonly called lambs' nine to ten inches in circumference. quarter. Should these new vegetables succeed, of which there seems now searcely a doubt, the country will have two most important additions to ts agricultural products. The Editor takes this ecasion to say, in answer to the inquiries of nunerous correspondents, that if he succeeds in heir cultivation, he will be able to spare a small uantity of both vegetables in the fall, and will ive timely notice through the Farmer.

HEMP.

A company has been formed in Farmington, in ie state of Maine, for the purpose of encouraging he cultivation of hemp and erecting machinery or dressing and preparing it for market. The ompany is called the 'Farmington Falls Hemp ompany.' Their machinery will be in operation y the first of August, in time to receive the ops of this year's growth. It is believed that rmers may make a profitable business by turning eir attention to the raising of hemp. A flourhing establishment for dressing hemp, as our aders are already informed, has been in operion the year past in Livermore,-Portland Cou-

BLACK CHERRY TREE .- A medical corresponnt of the Cooperstown Watchtower, says, that e bark of this tree is poisonous. WILLIS' GRAPE VINE.

Oxford, Md May 20th, 1831. Mr Saith-As my vine has excited so much curiosity amongst strangers and others, I yesterday called in two of my neighbors to try and count the bunches on it. One limb was up a fruit tree so high, that it could not be counted. It covers a large part of the yard in an espalier form, and has run up four fruit trees. You have the certificate of my neighbors inclosed, and may publish it if you please.

I have the honor to be, your most obedient humble servant. John Willis.

We hereby certify that we were this day, called on to count the bunches of grapes that were on the vine in John Willis' yard, and we counted them as well as we could, but have made allowances and thrown in many for good count, and have counted twentyfive thousand, one hundred and ten bunches, one third or nearly half of them are double bunches, and only counted as single buning like weeds. It was planted May 13th, and ches. The vine is commencing in its seventh year's growth, as he says, and the stem is only from CHARLES BROMWELL.

Oxford, May 19, 1831. RICHARD COSSAGES.

LINNEAN GARDENS AT FLUSHING.

Prince Paul of Wurtemburg, whose extensive travcls, and scientific attainments are so well known, attended by his suite, paid a visit the last week, to the Messrs Prince, proprietors of the Linnwan Botanic Garden and Nurseries at Flushing, Long Island, and expressed himself highly gratified at the great extent and high culture of the grounds, and at the immense collections of trees and plants concentrated therein, from every clime. This distinguished stranger is a great proficient in Botany, as well as in the other natural sciences .- N. Y. Com. Advertiser.

A correspondent of the New York Evening Post thus closes a very complimentary notice of the recent horticultural exhibition in Philadelphia :-

A peculiar order of things has sprung up in the city and neighborhood of Philadelphia, under the fostering care and well directed energies of the excellent founder of the horticultural society.

useful knowledge, to enlighten the minds of those who are engaged in the operative branches of horriculture, than to increase the wealth and consequence of the community to which the institution belongs. To the citizens this establishment has been of inealculable advantage, for they can legs, and finally loses all power to rise: at the now have an abundance of the rarest and best same time he has all his intelligence, and eats and fruits and vegetables at a comparatively low price; drinks for a while as usual. I give a table spoonwe trust that they will ever gratefully remember ful of spirits of turpentine, in as much or more to whom they are thus indebted, and that they will continue to ' give honor where honor is due.

It is to Dr Mease that the people of Philadelphia are under such obligations. This gentleman, having leisure, industry and zeal, and being, withal, fond of scientific pursuits-blessed too, with a happy temperament which delights in contribuing to the comfort and pleasures of others. has devoted his whole life to patriotic purposes.

have been known to kill a vigorous dog in a ces of these animals have been put in requisition, manner obtained from 19 to 20 per cent of potash one may be mentioned, which has as yet in this from felspur, and from 15 to 16 per cent from Mica.

part of the country been but little known-that of operating machinery. An ingenious mechanie in Connectient has constructed machinery, by means of which the services of a pair of dogs may be rendered quite profitable to their owner. In two of the eard manufactories in Leicester, in this county, the machinery is operated by dog power. In that of Mr Trask, one dog operates two machines for pricking the leather, and cutting and setting the eard teeth. A third machine is occasionally put in operation at the same time with the other two, and we were informed by Mr Trask that by altering the inclination of the revolving plane upon which the dog treads so as to increase the leverage, that four machines for cutting, pricking and setting card teeth might be driven by the same dog. The expense of the machinery for one dog, is stated at one hundred dollars, including the regulator to govern the velocity of the machinery. Each additional dog power costs twentyfive dollars. The labor of one dog by the aid of this machinery is made equal to that of two men. The dog is usually upon the working cylinder about one hour at a time, and is then relieved by another. The expense of keeping is estimated at about a shilling a head per week. A friend of ours, after witnessing the operation of this dog machinery, said the sight had helped him to the solution of an important query in his own mind, the utility of the huge cur dogs that throng almost every town, he concluded that they were made to drive machinery. The dogs we saw employed in that business seemed to be much more orderly and civilized in their demeanor than those idle, gentlemanly sort of curs who lounge about the town doing little else than annoy one's legs in the day time, and make night hideous by their howlings. The labor of one man has usually been required to operate a single card machine through the day. The reader can calculate for himself what saving there may be made in the card business by the use of dog power, without taking into the calculation the difference in the cost of machinery for working the eard machines by water, steam or horse power .- Worcester . Egis.

Spirits of Turpentine a cure for Staggers in dogs .- A writer for the Southern Agriculturist, after remarking on the value of the services of a faithful dog, and a disorder which often proves It has been no less his aim by disseminating fatal to animals of that species, called staggers, observes as follows:

The disease appears to arise from weakness in the loins; is most probably occasioned by worms. He has but little use of his hind legs-staggers about much-when down rises only on his fore molasses or brown sugar, three times a day and seldom find it necessary to continue longer than the second day before the dog is restored to health

Extraction of Potash from certain Minerals.—This alkali so important to the arts may, it is said, be extracted from minerals containing it by a very simple process. This consists in merely calcining them with lime, and then leaving them for some time in contact with water, which is afterwards filtered and evaporated. M. Fuchs, as quoted in Among the many purposes for which the servi- the Ann. de l' Industrie states, that he has in this

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, JUNE 29, 1831.

Hay making .- If a mowing lot is to be cut twice in a season, the first crop ought to be mowed earlier than where it is cut but once, in order that the roots may recover immediately, and be ready for vegetation afresh. Where the grass is cut later, the vegetation of the roots stops for some time. The grass, however, which is thus cut early will not be so heavy as that which is cut later, as it will shrink after eutting; but the roots will not be so much exhausted, and will afford a larger crop the next time of cutting, or the next summer if mowed but once in a season. London says in the cutting of grass crops, for the purpose of being made into hay, it is necessary that they be in the most suitable states of growth and maturity, for affording the best and most nutritious fodder. With this view they should neither be cut at too early a period, nor suffered to stand too long; as in the former case there will be considerable loss in the drying from the produce being in so soft and green a condition, and in the latter from a large proportion of the nonrishing properties being expended. Grass when mown before it comes in full flower, while the rich saccharine inice is in part retained at the joints of the flower stems. is in the most proper condition for being cut down, as at that period it must contain the largest propor- put into cocks; one thing is however always To the Editor of the New England Farmer. tion of nutritious materials, but which then begin attended to, not to shake out, or scatter or expose to be absorbed, and taken up in proportion as the flowers expand and the seed ripens, so as to constitute the meal or starely of the seed lobes, and is either dispersed upon the land or fed upon by birds; the grass stems with their leaves being left in a similar situation to that of the straw of ripened grain. But there are other circumstances, hesides those of ripeness, to be attended to in determining the period of cutting crops of grass, as in some eases, when they are thick upon the ground, the bottom parts become of a yellow color before the flowering fully takes place; under such eircumstances, it will often be the most advisable practice to mow as soon as the weather will possibly admit: for if this be neglected there is great danger of its rotting, or at any rate of its acquiring a disagreeable flavor, and becoming of little value. Where grass is very tall, as is often the case in moist meadows, it is liable to fall down and lodge, by which the same effects are produced.

The same writer, under the head Clover, observes that 'The making of herbage crops from hay is a process somewhat different from that of making hay from natural grasses. All the herbage tribe ought to be mown before the seed is formed and indeed before the plants have fully blossomed, that the full juice and nourishment of the plant may be retained in the hay. By the adoption of this system, the hay is cut in better season, it can be more easily secured, and is much more valuable. Nor is the strength of the plant lodged in the seed, which is often lost. The great advantage of converting under ripe herbage and grass into hay is now beginning to be known. There is much more saccharine matter in it and it is consequently more nutritions. A crop of clover or sainfoin, when cut in the early part of the season, municate the vibration to the whole, and see ten may be ten per cent lighter than when it is fully thousand green leaves, all curling themselves up, ripe; but the loss is amply counterbalanced, by and shrinking back at your approach, as if afraid

tionably be more heavy. The hay from old herbage will carry on stock, but it is only hay from young herbage that will fatten them. When the stems of elover become hard and sapless, by being allowed to bring their seeds towards maturity they are of little more value as provender, than an equal quantity of the finer sort of straw of corn.'

The mode of making clover hay, and that of all herbage plants, as practised by the best farmers, is as follows. The herbage is cut as close to the ground and in as uniform and perfect a manner as it is possible to accomplish, by the scythe kept constantly sharp. The surface having been in the preceding spring freed from stones and well rolled, the stubble after the mower ought to be as short part of the stems left by the scythe is not only lost, but the after growth is neither so vigorous nor so weighty, as when the first cutting is taken as low as possible,

'As soon as the swath or row is thoroughly is done by the hand or by a small fork; and let the eggs take their chance for another year in some farmers are so anxious to prevent the swath the open air. The success that has thus far attendover in the morning of a dry day is put into cocks S. Gazette. in the afternoon. It is impossible to lay down any rules for the management of hay after it is the hay oftener than is necessary for its preserva-

Large Strawberries,-There were exhibited by indge Buel, at the horticultural show on Tuesday, fifty strawberries of uncommon size and beauty. On weighing them, the committee found that fortyseven berries, divested of their stems, weighed a pound-three averaging a little more than an ounce; and it is said every berry exceeded four inches in circumference. These strawberries were of the kind called Methyen or Methyen Castle. from the place where the variety originated and are of the color and flavor of the common field variety. They were gathered from plants put out in August last, the runners of which had not been clipped.

There were also exhibited, at the same time from the Albany nursery, more than 100 varieties of hardy roses, 7 varieties of honeysuckle (Lonicera,) 6 of the pink (Dianthus,) Chinese peonies, dahlias, and more than 40 varieties of choice border flowers.

We were presented by judge Buel, a day or two since, with two bowls of the Methyen strawberry, most of which measured four inches in circonference, and of a rich flavor .- . Albany Argus.

From the Journal of a Resident in South America. 'I found for the first time the sensitive plant, growing wild. It spreads very often over marshy ground, something like a tumbler. The sensitive leaves spread out prettily from the creeping tendrils in the sunshine, something like lady-fern .-It is curious to come to a little dingle of them, where there are a thousand tendrils, all interwoven, like a bramble thicket, to shake the twig, and com-

SILK

We visited yesterday the silk establishment of Mr DUPONCEAU and Mr GARACHE, in Chesnut. near Second street, and were astonished at the yast number of worms which were feeding and spinning. One circumstance was mentioned to us, that is worthy notice. Last summer, a number of cocoons were laid away in the supposition that the worm was killed; but in a short time, the animal in its winged state worked its way through them, and as they were near the north window, they took their station in the sill of the window, and on the outside ; here they laid their eggs. No further notice was taken of them until this spring. when, to the astonishment of the people about the and smooth as a well shaven grass lawn. That building, these eggs that had been exposed to all the severity of the winter, hatched, and Mr Duponcean in order to carry out the experimen caused a number of worms to be put on the mulberry trees, in the yard of Mr Desauque, in Second street; there they fed upon the leaves, grew dry above, it is gently turned over (not tedded rapidly, and yesterday several were spinning on or scattered) without breaking it, sometimes this the branches. It is the intention of Mr D. to from being broken, that they will not permit the ed Mr Duponceau's experiments is gratifying use of the rake shaft. The grass, when turned to him as it will be beneficial to the country. -U.

THISTLES FOR SEED!!!

SIR-Whoever will take the trouble to walk up the short street leading from Washington street to South Boston Bridge, (or the 'old Bridge,' as it i frequently called) may see a fine patch of Canada Thistles going to seed, and preparing for distri bution, along the shores of South Boston, Dorehes ter and Roxbury. It has, probably, been imported from the eastward, in hav, which has been landed in that vicinity.

Should any individual in that neighborhood possess a scythe, he might perform an act of pat riotism by mowing said thistles before the seedi ripe. If not, perhaps some fellow citizen from th country, may take a scythe into town with him and perform this service to the public.

June 23, 1831.

Horticultural Hall, Saturday, June 25, 1831.

FLOWERS EXHIBITED. From the Brighton Nursery of Messrs Wiaships

a great variety of Roses, Lilies, Spiraes, &c. From the Charlestown Vineyard, by Mr Haggers ton, a splendid assortment of Carnations, and a fine

specimen of Hoya Carnosa. Fine Roses, and other flowers, from the garden of Gen. Dearborn, Z. Cook, Jr. Esq., E. Sharp, and

Samuel Walker. Several fine varieties of Scabiosa, from E. M

Richards, of Dedham.

From Mr Davenport, of Milton, dwarf Cape Jasmine, and Hydrangea.

NOTICE.

A Stated meeting of the Massachusetts Horticultural Society will be held on Saturday, July 2d, a II o'clock, at the Rooms of the Society, in Joy's buildings. R. L. EMMONS, Secretary.

The Quarterly Review, No. 89, has just been republished by Lilly & Wait, of this city, and contains articles on the following subjects: Beechey's Voyage to the Pacific and Bhering's Straits; Malthus and Saddler; Population and Emigration; Capt obtaining an earlier, a more valuable, and more of being trod on, the sensation-like feeling of life, nutritious article; while the next crop will propor-running over them all, as a shock of electricity.

Culture of Silk .- A writer for the Troy Budget, says 'The females of every farmer's family could annually realize \$100 and upwards by the culture of silk. There is no doubt of making fine, first rate silk, as the experiments—have been fully tried.

Mrs. Pawling of this city, last year made as beautiful silk as the best imported, I would recommend those who wish information on this subject to call on Mrs Pawling, or Dr Corning. Dr containing 100 to 150 acres of land, with a good and con-Corning has planted a large number of mulberry rees and is doing much to advance the silk culture.

Hanging of Window Blinds .- A correspondent of the National Intelligencer says; 'It is surprisng to me that the mode of hanging window olinds universally practised in France, should not have been introduced into our hot and sunny clinate. There the blind is hung by hinges at the op, and opens by being pushed out from below it any distance agreeable, instead of being hung on the side and opening perpendicularly. By our present mode, the blinds cannot be opened without admitting the sun; but by the French node the blind may be opened, and the air adnitted and the sun at the same time excludedhe window being still shaded, though the blind e open. Let any one try this plan on a southrn exposure, and he will find its superiority. another advantage is, that the blind is more easily nd quickly opened and shut; and a further aperiority is, you can have your blinds open ithout losing the pleasure of privacy in your We take, unfortunately, all our partment. ishions from England, and if England had adopt-I the French mode of hanging window blinds, e should long ago have copied it. But the English climate, requiring the admission of all the ttle sunshine nature gives it, forbids the adoption the French mode, and we, therefore, have rected it, although our climate renders it more derable than even in France itself. I pray our nilders to consider the subject.

Hydrophobia.- Dr Hamilton, after a laborious search, fixes the 10th day after the infliction of e wound, as the earliest period at which this sease has appeared, and 19 months as the latest. etween these periods the times of attack are ry various. Of 131 cases, 17- were seized bere the 30th day; 63 between the 30th and 59th; from 60 to 90 days; 9 from 90 to 120; and 14 om 5 to 19 months. The Dr afterwards menons the case of a boy bitten in the toe by a cat, the 14th July, 1797, in which the poison lay rmant until 19th Nov. 1800, a period of three ars and four months! Dr Thacher's work on tion. ydrophobia contains a minute description of seval cases, almost too horrible to read or think of. Journal of Commerce.

in apothecary in the neighborhood of Narbonne has blished a treatise extolling the husks of grapes nich have been deprived of their alcohol by distilion, as an excellent substitute for bark in tanning ather. After having prepared the skins in the ual way, he places them in the pits and covers em with the grape husks. From five and thirty five and forty days are sufficient to complete the nning. This method, according to the author of offers the following advantages: The operation much more rapid, it is much more economical: e leather has an agreeable odor instead of that lan; and it is twice as durable as leather tanned bark.

ERRATUM .- In page 379, 2d cel. 10 lines from bottom, Signite read Cyanite.

Farmer Wanted.

A permanent situation offers for a man who understands larming generalty, and a little of gardening, and who would teel an interest in his employar's business,to go on to a farm in one of the pleasantest towns in New England, on Connecticut river-Apply personally at the New England Farmer office.

BRIGHTON MARKET-Monday, June 27.

[Reported for the Chronicle and Patriot.]

At Market this day 111 Beef Cattle, including 25 unseld last weck; 9 Cows and Calves; 1642 Sheep and Lambs, and about 100 small pigs and a lew old swine.

PRICES .- Beef Cattle-In consequence of the limited number at market an advance of about 37½ cts. per hundred was effected-we shall quote from 4 75 to 5 75.

Cows and Calves-Sales were noticed at \$15, 19,

Sheep and Lambs-We noticed sales of lots at 175, at 1 88, at 2 00, at 2 25, and at 2 33-weathers at 2 121 at 2 50, and at 3 00.

Swine-No sales noticed.

In our last week's Report the number of Beel Cattle should have been 231 instead of 331 as reported.

BOSTON FANEUIL HALL MARKET .- Peas, \$1 to 1,25 per bushel. Early Mohawk String Beans, 75 cents per peck. Strawberries 12 to 17 cts. per box. Early white Dutch Turnips, 12 cts. per hunch. Cherries 12½ cts. per quart. Cucumbers 75 to \$1 per doz.

MISCELLANY.

MELODY.

Silently, O silently, The moon beam falls on me : Silently, as silently, It falls on land and sea.

Silently, still silently, Creation's wings wax bright; Silently, more silently, Bright morn succeeds to night.

O let my soul, thus silently, Depart from earthly clay: Thus silently and beamingly Enter the realms of day.

TEMPERANCE.

Temperance Societies .- An aged man observed to one of the distributors of the city committee, that the change which had been produced among scamen, riggers, and the workmen about the docks and slips, was almost incredible. 'I have lived in the city, said he, ' many years, and my occupation brings me in contact with these men; and in comparison with the profanity and drunkenness which prevailed a few years ago, all is now peace and quietude. Officers and hands read the bible, and attend church; many of our vessels are constantly going to sea, and making voyages, without any spirit on board. Such a change I never exrected to see as has been accomplished by tracts and temperance societies .- Report of the N. Y City Tract Soc.

EVILS OF INTEMPERANCE.

The biographer of Napoleon, speaking of the loss sustained by England on the field of Waterloo, says: 'Fifteen thousand men killed and wounded threw half Britain into mourning. It required all the glory and all the solid advantages of that day to reconcile the mind to the high price at which it was purchased. But what mourning would fill all Britain, if every year should behold another Waterloo? But what does every year repeat in our peaceful land? Ours is a carnage not exhibited only once in a single field, but going on continually in every town and hamlet.

Every eye sees its woes, every ear catches its, groans. The wounded are too numerous to count; who is not wounded by the intemperance of this nation? But of the dead, we count, year by year, more than four times the number that filled half Britain with mourning. Could we behold the many thousands whom our destroyer annually delivers over unto death, collected together upon one field of slaughter, for one funeral, and one deep and wide burial place; could we behold a full assemblage of all the parents, widows, children, friends, whose hearts have been torn by their death, surrounding that awful grave, and loading the winds with tales of wo, the whole land would ery out at the spectacle. It would require something more than all the glory and all the solid advantages,' of intemperance, ' to reconcile the mind to the high price at which they were purchased .- . N. Y. Address on Temperance.

How to Please Your FRIENDS .- Go to India, stay there twenty years, work hard, get money, save it, come home-bring with you a store of Oysters on the Canal Street Plan.' But an Irishman, wealth, and discused liver, visit your friends, make who keeps a cellar near the Chatham Theatre, with a a will, provide for them all-then die-what a prudent, good, generous, kind-hearted soul you will be.

NEW DEFINITIONS.

Absurdity. Anything advanced by our opponents contrary to our practice, or above our comprehension.

. Imbiguity. A quality deemed essentially necessary in diplomatic writings and law proceedings.

by Crabs, and recommended to mankind in gene-

ral by the Holy Alliance, Blushing. A practice least used by those who have most occasion for it.

Book. A thing formerly put aside to be read, and now read to be put aside.

Breath. Air received into the lungs for the purposes of smoking, whistling, &c.

Cunning. The simplicity by which knaves

generally outwit themselves. Ditch. A place in which those who take too much wine, are apt to take a little water.

Echo. The shadow of a sound.

Finger. An appendage worn in a ring, and of great use in taking snuff.

Gain. Losing life to win money.

Health. Another word for temperance and exercise,

Idol. What many worship in their own shape, who would be shocked at doing it in any other.

Mouth. An useless instrument to some people, —in as far as it renders ideas andible, but of special service in rendering victuals invisible.

Pedant. A man so absurdly ignorant as to be vain of his knowledge.

Quack. A man who only wants a diploma to make him a regular physician.

Satire. Attacking the vices or follies of others instead of reforming our own.

Saw, A sort of dumb alderman, which gets through a great deal by the activity of its teeth.

Ugliness. An advantageous stimulus to the mind that it may make up for the deficiencies of

Umbrella. An article which by the morality of society you may steal from friend or foe, and which for the same reason you should not lend to

Vice. Misealculation; obliquity of moral visions; temporary madness,

Voice. Echo is the only instance of a voice without a body, whereas three parts of our unprecedented population are bodies with out a voice - London New Monthly.

Royal Sports.-Louis XI. ordered the Abbe of Baigne, a man of great wit and who had a knack of inventing new musical instruments, to get him a concert of swine's voices, thinking it impossible. The abbot accordingly mustered up a number of hogs of several ages, and placed them under a pavilion, covered with velvet, before which he had a sounding board, painted with a certain number of keys, thus making an organ; and as he played on the keys with little spikes which pricked the hogs he made them ery in such tune and concert as highly delighted the king and his court.

An Independent Oysterman .- At many of the oyster cellars in New York, the signs are inscribed withpraiseworthy spirit of independence, both in the matter of business and in spelling, has a sign lettered thus-Augusta, Me. Wm. Mann.

f business and in spelling, has a sign lettered thus,

Hadjar, N. S.—P. J. Holland, Esq. Recorder Office,

Oysters on my Oen Plan, as good as any other Plan.' Modured, L. C.-A. Bowman, Bookseller

Valuable and Cheap Land-for Sale.

The subscriber offers for sale, 14,000 acres of choice Land, situated in the town of Pinckney, county of Lewis and state of New York. Some of the land is improved and under cultivation. The country is remarkably healthy, being entirely free from the fever and ague and from the common bilious fevers which often afflict the towns upon Lake Ontario, this town being 18 miles east of the Buckward, A mode of advancement practised lake. The soil is principally a sandy foam, much of it covered with rich black mould. The timber is chiefly Sugar Maple, Black Ash, Butternut, Beech, Elm, &c. The land yields first rate crops of Grass, Rye, Oats, Barley, Potatoes and Flax; and on some lots, good Wheat and Corn may be grown. To those wishing to obtain superior grazing farms, a fine opportunity now offers itself. The produce of pasturage and hay from an acre of this land, is very large, fully equalling if not surpassing that from the same quantity of land in any other of the Black reposes of smoking, whistling, &c.

Courage. The fear of being thought a coward. streams upon them. The land is well adapted to Orcharding-the Apple tree thriving very well in this county. Stock of all kinds may be disposed of with the least possible trouble, and to the greatest advantage, the drovers purchasing at the very doors of the farmers, and paying the highest cash prices for their cattle, which will readily find purchasers at all seasons of the year. Several farmers at present residing on this town, were originally from the New England States, and some of them from Massachusetts, who are in thriving circumstances. The above described land is offered for sale at the very low price of from two dollars and a half to three dollars per iere, for the uncleared land, and from three dollars and a half to five dollars and a half for the improved lots. The land will be sold in lots to suit purchasers, and from two to five years' credit for payment, in annual instalments, will be given. As a further convenience to purchasers, the subscriber will receive in payment, Cattle, Sheep, Perk, Grain or Grass Seed, for which products he will allow the highest cash prices. The title to the land is indisputable, and good Warranty Deeds will be given to Persons desirous of purchasing will please purchasers. to apply to the subscriber, at Henderson Harbor, county of Jefferson, State of New York, or to DAVID CANFIELD, JAMES H. HENDERSON. Esq. on the town. March 9. ep16t

Ammunition (1)
Of the best quality and towest prices, for sporting—constantly for sale at COPELAND'S POWDER STORE, 6: Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be refunded. tf Jan. 7

Hickory.

This astonishing fleet horse was raised in Montreal, is from an English blood mare, (sire unknown,) is not inferior to any in the U. States for speed, action and beauty. He is a fine sorrel, well built, good size, and pronounced by (good) judges in every respect a first rate horse; trots a 3 minute gait, last walker, and has paced around the trotting course, Long Island, in 2 minutes, 34 seconds, and was offered publicly to match against any horse that could be produced. It is considered unnecessary to say more, as his qualifications are too well known to be doubted.

He will stand at Abbott's Inn, Holden, during the season. Terms \$8, the season. 6tMay 11.

Published every Wednesday Evening, at \$3 per annumpayable at the end of the year-but those who pay within sixty days from the time of subscribing, are entitled to a de-

being made in advance.

ADDRESS

of Domestic Industry.

By SOLOMON DROWN, M. D .- (OCTOBER, 1833.)

words, with profit,' What art, then, could be more worthy of improvement, and yet how much is expended for the improvement of almost every other art. This shameful neglect in general of what pertains to the furtherance of agricultural science. is not a thing of modern date. Nothing, says Columella, an excellent ancient writer on Agriculture ;-nothing equals my surprise, when I consider, that those who would learn to speak well, choose an orator whose eloquence may serve them for a model: those who desire to apply themselves to dancing, to music, and to all the frivolous arts, search eagerly a master of meloly, a master of the graces, in a word, each chooses the best master in order to make rapid progress under his direction; whereas the art the most necessary to life, and which is nearly allied to wisdom, has neither lisciples who learn it; nor masters who teach it. And a modern writer remarks that the most useful. one of the most difficult, and that which ought to propriety?" be esteemed the most honorable pursuit in life, has ocen generally considered so easily understood. hat schools, deemed necessary in 'almost everyhing else, have been looked upon as of no conequence in this. With respect to instructing a school, and course of Agricultural Lectures here, -Sir John Sinclair, speaking of an Agricultural rofessorship established at Edinburgh, observes: - The utility of such an institution is so evident, at it ought to be extended to all the other uni-The attention of young men, by such stablishments, would be directed early to this just useful of all the branches of knowledge." he science of agriculture is publicly taught in e Swedish, Datish, and German universities, and some of the German and Russian colleges there e professors' chairs for gardening, forest-culture, e. The agricultural institution in Prussia, under e direction of Professor Von Thacr; and the tablishment at Hofwyl, near Berne, conducted the expense of M. Fellenberg, a proprietor and riculturist, are much celebrated. Even Spain, ually imactive on these occasions, in spite of all e prejudices of a bigoted religion, invited Lineus, with the offer of a large pension, to superinad a college, founded for the sake of making quiries into the history of nature, and the art of griculture. To show further the need of studyg this as well as other arts,-we may adduce

He says, that not only the art of the farmer, prejudice.

quire much more skill and experience than the the inhabitants to extend every species of improve-Delivered before the Rhole Island Society for the Encouragement greater part of mechanic trades. The being brought to a state of perfection. The ob- the health, strength, and temper are very differ- operations on the beautiful experimental ground ject of this art is 'to increase the quantity and in- ent upon different occasions. The conditions of prove the quality of such vegetable and animal the materials which he works upon, too, are as productions of earth as are used by civilized man; variable as that of the instruments he works with, and the object of the agriculturist is to do this and both require to be managed with great judgment with the least expenditure of means; or, in other and discretion. His understanding being accustomed to consider a greater variety of objects, is generally much superior to that of the other, whose whole attention, from morning to night, is commonly occupied in performing one or two simple operations.-In China and Hindoostan, accordingly, both the rank and the wages of country laborers are said to be superior to those of the greater part of artificers and manufacturers.'

The illustrious Washington, in his message to Congress, in 1796, observes:- 'It will not be doubted, that with reference either to individual or national welfare, agriculture is of primary importance. In proportion as nations advance in population, and other circumstances of maturity, this truth becomes more apparent, and renders the cultivation of the soil, more and more an object of public patronage. Institutions for promoting it, grow up, supported by the public purse :- and to what object can it be dedicated with greater

This is a very suitable place for such an institution, where lectures may be given, and a course of instruction pursued, explanatory of the sciences connected with Agriculture,-vegetable Chemistry, with analysis of soils, -the outlines of Botany, a science so useful to the agriculturist, and horticulturist,-Meteorology, and other parts of Natural Philosophy, &c. Here might be kept, as models, the hand-threshing machine; the machines for breaking flax and hemp without watering or dew-rotting; the most approved silk-reel, &c.

Agriculture, says Sir John Sinclair, though in general capable of being reduced to simple principles, yet requires, on the whole, a greater variety of knowledge, than any other art .- It can never, he says, be brought to its highest degree; of perfection, or established on rational and unerring principles, unless by means of experiments, accurately tried, and properly persevered in .to rely on vague opinions and assertions which have not been warranted by sufficient authority .--

around this Hall, would be calculated to ascertain the best modes of culture, and best implements; the most profitable and beneficial rotations of crops, the best manures, and whether old or new manure is preferable for the generality of crops, &c. No doubt, however, new is best. The using fresh, i. e. unfermented manure, recommended by A. Young and others, has been considered a modern improvement: but this was known to Columella, who observes, Finum pratis quo vetustius minus prosit, quia minus herbarum progeneret: i. c. the older the dung the less profitable it is for meadows, because it would produce less herbage. - Such fundamental maxims, enforced by actual experiment, would make stronger and more durable impressions on the minds of young agriculturists than the mere reading them. 3 Virgil, in his incomparable Georgies, declares,

-Pater ipse colendi Haud facilem esse viam voloit:

The Father of Nature himself would in no wise have the ways of tillage to be easy :- And Sir II. Davy observes, of the vegetable kingdom is not to be considered as a secure and unalterable inheritance, spontaneously providing for our wants; but as a doo'nfilt and insecure possession, to be preserved only by labor, and extended and perfected by ingennity.'-And Hesiod, an ancient Greek, the earliest writer on Agriculture, whose works have descended to us,-says:

The fool of man in deep concealment lies :-Else had one day bestow'd sufficient cheer, And, though inactive, fed thee through the year .-Love ev'ry scendy toil, that so the store Or foodful seasons heap thy garner's floor. From labor men retorns of wealth behold; Flocks in their fields and in their coffers gold: From labor shalt thou with the love be blest Of men and gods; the slothful they detest. Not toil, but sloth shall ignominious be; Toil, and the slothful man shall envy thee; Shall view thy growing wealth with alter'd sense, For glory, virtue walk with opulence. But shun extorted riches; oh, far best The heaven sent wealth without reproach possest.

Let me repeat it-if there ever should be an The ardent inquirer, has too long been obliged agricultural school or seminary established in this State,-this, undoubtedly would be the most suitable place for it; - and such establishments are The object of an experimental farm should be, strongly advocated by one of the most eminent to ascertain facts, and to publish them; and as agriculturists and practical farmers of our country. much credit would be acquired, by an intelligent The establishment of agricultural schools in the conductor of an experimental farm, for his exer. CHAMPAIGNE CURRANT WINE.

MR FESSENDEN,

Dear Sir -- Agreeably to request I have the pleasure to hand you the details of my process for making current wine.

INGREDIENTS FOR 30 GALLONS OF WINE.

3 Bushels or 150 pounds of Currants

75 Pounds of white Havana or dry Brazil Sugar.
3 Pints of white French Brandy, with sufficient pure

Gather the fruit in dry weather when rather under than over ripe-mash them to break every berry, but not bruise the stems-add a portion of the water and after stirring well turn the mass on to a strainer over a grain riddle or cheese basket, rubbing and pressing gently with the hands ;by repeating the operation a few times, all the vinous and saccharine matter will be extracted and much of the pulp kept back, which occasions not only too great a degree of fermentation but diminishes the quantity of wine by the lees it forms-saving much trouble in comparison to the usual practice of squeezing and wringing through a strainer, by the fair hands of the willing females to whom the duty is commonly assigned-which not only forces through nearly all the pulp and many seeds, but extracts a crude acid from the stems, that is anything but vineus. The sugar should be put into a tub or other open vessel with the brandy : and the liquor strained on to it. When the sugar is dissolved, strain the whole through a fine hair cloth or sieve into a strong sweet cask of 32 to 34 gallons and fill up to within 2 to 4 gallons, which leaves sufficient room for the fermentation to proceed; and drive in the bung so that no air can enter or gas es-

It is desirable that all parts of the process should go on at the same time, and be finished with all possible despatch-observing the same neatness as in a well managed dairy. The sooner the wine is bottled after it is perfectly fine, the more briskness it will exhibit. The maxim the better the sugar, the better the wine,' I have found by experience to be correct, and I am inclined to believe, that double refined loaf sugar, said to be an indispensable ingredient for the manufacture of Champaigne in France, would produce a wine as much superior as to compensate for the extra exbrandy) for such fruit as I have cultivated. REMEDY FOR WOUNDED FRUIT TREES.

In a communication which I addressed to you a year ago last January, I mentioned that I had had the bark gnawed from a favorite young pear tree, by a mischievous sow a short time before, and requested you, or some correspondent to inform me what I could do to save it .- The case was probably thought a desperate and hopeless one, as my request was not noticed; indeed I considered it so, as the bark was entirely torn from the tree more than two feet from the ground and the wood considerably mangled. But I have now the pleasure to inform you, that the tree is yet alive and is now bearing young fruit which promises to come to maturity in due time. The method I took is as follows. The wound was covered with mortar clay, and old lime plaster, and bound on with

sure, but I think it will recover.

WINTER GRAIN.

If the following simple rules were universally followed, there would be a much greater quantity of Indian corn, and winter wheat raised on old land than what is grown at present. Select a piece of ground suitable for Indian corn and winter grain, (and there are but few farms where such ground cannot be found if properly managed) spread on evenly 20 common eart loads, or upwards, of stable and yard manure to the acre, plough it in just of the dwarf Cape Jasmine. 3 inches deep and no more; harrow it lengthwise of the furrow, cross mark for the rows 34 feet for the small, or 4 feet for the large kind of corn. Let the corn be properly tended by keeping the ground loose with the plough and hoe, and free from weeds, and if the season is not very unpropitious you may safely calculate on a large crop. But if the ground is hard and stony so that it cannot be ploughed shallow as above recommended, then plough as shallow as possible, and spread on the manure afterwards and harrow it in, and proceed as above directed,-the erop will not probably disappoint your reasonable expectations. As soon as the corn has become ripe or too hard to roast, and if possible before it is touched by a frost, cut it up, bind and earry it out of the field, and shock it in the usual way. If you have drawn the earth around your corn into hills (which I would advise never to do in any case) harrow the hills down with a heavy harrow, plough 3 inches deep, and spread on evenly 4 or 5 loads of well rotted manure and sow 3 pecks of good clean wheat to the acre, and plough it in with a light horse plough, and unless something disastrous happens, the summer following your garner may be filled with the finest of wheat. The same directions will apply to ground planted with potatoes. I would insure a crop sown on ground thus managed for ten per cent less than if sown on a summer fallow in the ordinary way.

Yours very respectfully

JNO. TOWNSEND.

Andover, Con. June 28, 1831.

BEES.

MR FESSENDEN-I have for the year past been much interested in the culture of Bees, and have been somewhat interested in the discusion of Drs Thacher, Smith, and others, and amused with their theories.

About the first of June I placed a fine swarm in a dark room six feet square, over my wood house, to prevent swarming and to be out of the way of the moth, fifteen feet from the ground. Some twenty or thirty bees found their way through a crack in a door opening into a chamber, where I had laid by with other boxes an old hive partly filled with comb, in which the bees had perished the last winter for want of food .- The bees could not find their way back-and much to my surprise, commenced clearing out the old hive which a box containing a quantity of the Cassabar had not contained a live bee since April. They melon seed spoken of in that letter, and which worked two days before I was aware of it. I opened a window to permit them to escape. They continued to work for three weeks, until I added to district and a portion of Pumpkin seed. I do not them a small swarm which I found hanging on a know that either of these two latter kinds will be "muriatic acid saturated with potash. The straw tree. Dr James Mease of Philadelphia was elected an honorary member. Mr Isaac Livermore of Boston, a subscription member.

FRUIT.

Saturday, July 2, 1831. A box of white Antwerp and a box of Red Antwerp Raspberries, of fine appearance, were presented by Hon. H. A. S. Dearborn.

A basket of large and fine Gooseberries, comprising five varieties, was presented by Mr S. Walker of Roxbury.

A box of Downer Cherries, very fair for the season, was presented by Mr S, Downer.

Two boxes of very fair Natural Cherries were presented by Mr Aaron D. Weld of Roxbury. S. Downer, Chairman pro tem.

U. S. Ship Concord, Malaga, April 22, 1831.

GENTLEMEN-By the brig Union, Capt. Wade, I send a small box containing a few seeds from Spain and the Islands of Minorca, which I trust will be acceptable.

It will afford me great pleasure to forward from time to time, during my cruise, such plants and seeds as I may be enabled to collect. I have already made arrangements for procuring some of the young shoots of the Cork Tree, and hope to succeed in getting them safely to the United States,

I am, gentlemen, most respectfully, Your friend and obedient servant,

M. C. PERRY. Messrs H. A. S. DEARBORN, and ZEREGEE COCK, JR. Boston,

U. S. Ship Ontario, Smyrna, 1st April, 1831. MY DEAR SIR,-In conformity to the promise made in the letter I took the liberty to address to you by the brig Daniel Webster which departed for Boston on the 18th ultimo, I now ship to you are undoubtedly geniune; the same box contains also some water melon seeds from the same out one. They could not, I think, have found any barrel of grape cuttings, which having been selected actibility.

Rosakie, Roundhites, Mouscata, Pranel's, (Clazomen) Currant and Black.

I ship to you likewise two barrels of the Wild Olive Tree; one of which you will oblige me by re-shipping to Charleston, South Carolina, to the address of my friend Gen. Robert Y. Hayne, as no direct opportunity offers from here. If the Olive can succeed at all in our country (of which I have much doubt.) it must be in a Southern section. The invariable practice here I learn is to engraft the Wild Olive after two or three years' growth, from the domestic tree; if we would succeed in culti-Fine bunches of Flowers from the gardens of vation we must adopt the same plan. The cuttings can easily be procured hereafter, should we find the Native Tree inclined to flourish with us. If these reach you in preservation, and you are not disposed to attempt rearing them in our Northern climate, permit me to suggest the propriety of sending them to some agricultural friend in Florida, the soil and climate most favorably adapted, probably, to the experiments of their cultivation,

> The interest I feel in adding my mite to the prosperity of our common country, will I trust plead my excuse for the trouble I may impose on you. I am Dear Sir, with high respect,

Your obedient servant,

TH. HOLDUP STEVENS,

Commander. General H. A.S. DEARBORN, Buston, Mass. U. S. of America.

From the N. Y. Farmer. Copy of a Letter from Thomas William Coke, Esq. M. P. to Mr John Fisher, in reference to the Devonshire Cattle raised by the Messrs Hurlbut, of Con.

HOLKHAM, APRIL 21, 1831. Sir,-I am this moment favored with your kind letter, and most flattering account of the Devon Oxen. It is to me a pleasing reflection that I was the first person that introduced them into America through my friend Mr Patterson. I thought then at that time, and I am still more confirmed in that opinion now, that they are the most superior kind of cattle in this Island, if well selected. But I beg to be understood, when I speak of the Devonshire red Cattle, it is in praise of the North Devon Cattle, with yellow noses and indented foreheads, and yellow around their eyes, which mark their character, beyond that of the Southern or South Derons, which have black noses, or intermixed with black. These I beg to be distinctly understood not to recommend, or to be in any way recommended by me, as a superior breed of

Be so kind as to express my acknowledgments to Mr Hurlbut, when you see him, and to assure him that I shall be at all times most happy to show him, or any of his American friends, should they come to England, every attention in my power in the Agricultural line,

Cattle

I remain Sir, your Obliged, humble servant, THO, WILLIAM COKE.

M. Fischer, of Vienna, has discovered a new process of Bleaching Straw. Instead of smoking it with sulphur as heretofore, he steeps it in the From the Genesee Farmer.

CURRANT WINE.

Never expecting to arrive at a competency that would enable me to enjoy the luxury of foreign Wines, I was led to seek for substitutes in our home productions. Having never met with any current wine that would answer, I turned my attention to eider, obtained sundry receipts for making cider wines and made experiments on swer as the substitute for wine; but all my nudertakings failed, leaving it to remain eider. Although considerable improvement can be made on the common mode of manufacturing eider, so as to make it worth three or four times the value of ordinary cider, yet the malic acid of the apple, will not afford the vinous flavor, like the tartaric neid of the grape.

I then began the culture of grapes, hoping that out of American grown grapes to be able to make a home-made wine that would serve as an apology for the luxurious flavor of foreign wines,

It is only two years ago that I first met with a currant wine, at Oliver Phelps', in Canandaigua, that possessed a sufficiency of the vinous flavor to characterize it with the name of wine; all the others that I had drank of before, were deficient in the vinous flavor: they were too heavy and of a syrup taste, probably owing to the want of a just proportion in their ingredients,

But finding Mr Phelps' so good an imitation of foreign wine I was induced to imitate it. Accordingly, I took his, and also Maj. John Adhun's reecipt for making current wine, (which I have an-liquor in its flavor, although possessing a good nexed) and varying their process in obtaining the body. It is of a pale white cider color, and a juice of the currant, to conform with Maj. Ad-strong acid cider taste; so that I consider the lum's process for making wine of the grape, and experiment of making wine from peaches an entire last year made the following experiments:

I picked the currants about the middle of July. out the juice immediately, I covered the barrel out the juice by hand; (a press of some kind would led to. have lessened the labor, and to have added a few sugar, and the other with honey.

To the one I added thirtyseven pounds maple sugar that had not been drained of its molt-ses, and sufficient water to make fifteen gallons of the whole; then tested its strength by putting in a heu's egg, (Major Adlmn's handy and concenient substitute for the Sacchrometer) and found that it floated the egg, showing about the size of a shilling piece above the surface; then put up the must the produce of my farm, I preferred to venture it, into the cask.

gallons.) After the honey was dissolved, I also to sustain the liquor; but he objected to that on tested this with the egg, and found it to show a Maj. Addum's principle of developing the alcopart of the shell above the surface about the size of a pistareen ;-which clearly showed that honey contains as much saecharine, for its weight, as su-liquor, and should we find it in danger of pricking

The casks were put into the cellar to ferment

days bunged tight.

fined with a pint of skim-milk, and left to stand.

In September I took about two bushel of peaches, (of the Columbian peach) pounded them up, them for several years, in order to make cider an- and left them to stand a few days and ferment, as some labor, I obtained about three gallons of inice. and to which I added two pounds of honey to the gallon, and tested it with the egg, and put it up in a small keg, for making,

> In October 1 picked about half a bushel of the Isabella Grapes, and spread them in the chariber for three or four weeks to dry; then mashed and put them into a stone jar, to ferment; by neglect, these were also left to stand nearly a week, when a blue mould had formed on the top, and the acetous fermentation had evidently commenced; from them I obtained about two gallons of price, to which added two pounds of honey to the gailon, which here the egg to the size of a two shilling piece above the surface; then put the must into a stone jug to make,

Both of these were racked off and fined in De-

Owing to the prussic acid of the Peach, when assimilated with saccharine, not developing the vinous flavor, the like as the tartaric acid of the grape, the peach juice has produced a very inferior failure.

That of the grape juice is evidently injured by I had seven pecks, (instead of nine, as given in the acetous fermentation, when suffered to stand the receipt for a barrel of wine) washed and pound- too long as before mentioned. It has a dark red ed them in an open barrel, and instead of pressing Teneriffe color, approaching to the Burgundy, with a cooling taste, owing to the redundancy of with a board and left it to stand and ferment; but the tartaric acid and fixed gir. It has been rather (instead of 12, 24, 36, or 48 hours, as Major an indifferent liquor, but is improving considerably Adlum prescribes for grape juice) by neglect I by age, and gives indications that it would have let them remain four or five days, when they had been a successful experiment, had the quantity gathered some mould on the top; then pressed been larger, and the process been duly attend-

The current wine made of maple sugar has its gallons of water would have obtained more extract color darkened to Teneriffe by the coloring matfrom the currants, and also facilitated the strain- ter, and its flavor rendered slightly bitter from ing of it) then, divided the juice into equal parts the impurities of the sugar, clearly showing that in order to make two half barrels; one with maple the liquor will be improved in proportion to the purity of the saccharine used in making it. It has a slight tinge of the Malaga flavor, and nearly equal in its quality; it is a drinkable current wine.

But that made of honey promises to become a superior article; it was a suggestion of my own, following, it will be fit for use, or for bettling, as proposed to Mr. N. Goodsell, who at first object- you choose. All this process must be done with ed to the experiment,-but having the ingradient, and proposed to add a gailon of brandy, accor-To the other I put fortytwo pounds of strained ding to Mr Phelps' receipt, should be consider honey, and water to make the quantity (fifteen the honey as wanting in giving a sufficient body hol of wine, by fermentation, rather than by distillation, as making a more pure and wholesome we could then add the spirit,

During the first two or three months, the sugar

and make, leaving the bungs open for a few days, promised to be the better liquor; but afterwards, then put them in loosely, and in ten or twelve the honey gained on the sugar until it was racked when it tell back for a few weeks, but afterwards In December it was racked off, when each eask it regained, and continues to increase in superioriafforded two gallons of lees in current pulp; after ty over the segar. It has nearly the color of Maracking, it was put back into the casks again, and deira, perfectly fine and limpid, with a good body, and the spirit of the boney gives to it the exhilarating properties of still champaigne: its flavor denotes the usadulterated purity of its ingredients and physicians have admitted it good for I had done with the currants, from which, with medicinal uses, next to Madeira, and by several persons it has been considered equal to the Sicily Madeira, which retails at two dollars. While compating the ingredients at their market price, and allowing something for the labor, it may be estimated to cost about fifty cents.

Those who do not produce honey, can procure the Havana honey in Rochester at one dollar the gallon, which is estimated to weigh thirteen pounds,-that would need to be clarified ;-it can be put into a stone jar, and that into a kettle of water and boiled, which will holl the honey and allow it to be skimmed; or add some of the water to fill the cask, and boil it in the ket-

The manner in which I obtained the supply of honey in July, was by driving the bees, after they have done swarming, out of the old hive, into a new one,

As the honey was considered as a secondary experiment, I but it into an old balf barrel I had on hand, which sprung aleak in the winter, and by the spring I had lost more than half its contents. I propose to get an iron bound cask, and have it painted for preservation. They can often be lead of the merchants, after having retailed out their imported wines; and to retain their lees, and put the enrrent wine on those lees, will improve its vinous flavor. J. HAWLEY.

Oliver Phelps' Receipt for making Current Wine.

Pick your currents in a fair day, when fully ripe, say between the fifteenth and twentieth July. Wash them in a tin cullender clean from dust, then put them into a clean flanuel bag, and press out their juice. Measure it, and to every gallon of pure current juice add two gallons of cold well water, and to every gallon of this mixture add three pounds of good clear brown sugar, the purer and lighter, the better, (excepting the Havana) and to every eighteen gallons of Equor add one gallon of the best French brandy.

When the whole is well united put it into a good clean cask; fill it nearly full, and put a piece of leather over the bung hole with a small weight on it. Take care that the cask is not so full as to work over, as this would injure the liquor, and after the fermentation has ceased, bung the eask as tight as possible. In the month of May neatness, and you cannot fail in having the first rate of ourrant wine.

John Adlum's Receipt for making Current Wine.

Take two bushels of currents, sixteen gallons of water, and from seventytwo to eightyfour pounds of sugar, (according as you would have it more or less strong.) Bruise the currants, add the water, then press or squeeze out all the liquid; then add the sugar, dissolve it, and put it into your cask in the cellar to ferment; keep some of the liquor to fill up the eask as it wastes by fermentait lightly, and in about a month drive it in tight; mates, xamine it in November or the beginning of Decemer, and it will generally be found fine and bright, good, and be improving,

By taking nine pecks of currants and eighty four

This mode of making current wine, will make more like a foreign wine, than any other I am quainted with; and as almost every person who is a garden, has a number of current trees, I give t wanted for jelly, into a very fine wine.

Note - Thirteen and a half nounds of sugar proce one gallon of liquid. The currants ought to picked on a dry day, and the wine made the ons were completed in a day.

From Holbrook's Scientific Tracts.

SILK WORMS.

a moth, whether it be looked upon as an article commerce, or an object of domestic employant, is well worthy the attention of our country. e press first attended to the manufacture of silk, the following letter. I s occupation for a long time was confined to es of the most elevated standing; but gradually uel as an article of exportation, and was ly safe as they are. gried from the northern parts of the Chinese a placed the raising of silk-worms into France. th now derives from their labors 23,560,000 is anually .- Although in 1180, silk was imand into England from China, which was carhan it had been received in France; still nothof importance was done towards the introducof the caterpillar into England, until within alast eleven years,-two hundred years after Three had set an example. Although two preing attempts had failed to render the cultivaof silk important in Germany, during the past ve years great efforts have been made there, try would show that the silk raised near the and stock,-Genesee Furmer.

ion, and in about ten days bung it up tight, and polar circle is equal in strength and firmness to ore a gimblet hole near the bung, and put a peg any species cultivated in more temperate cli-

The cultivation of the silk-worm in this country, is becoming an object of so much importance, then it ought to be racked into a clean cask well that during the year 1828, the Senate of the Uniunigated with sulphur, and if it is not perfectly ted States, ordered 2000 copies of a letter from the ne and bright, fine it; after which it may be Secretary of the Treasury, transmitting all the ottled, or again racked into another cask, as information which could be collected respecting hove directed; when it will keep for years in the the cultivation of silk in the Union, to be printed for the use of its members. In Virginia, Georgia and South Carolina, the silk-worm has been rearounds of sugar, a whiskey bacrel full may be ed for many years. In 1760, silk was first raised ade, holding from thirtytwo to thirtyfour gal- in Connecticut. Since then in New Hampshire, ns-if the cask is not quite tull, fill it with wa- Vermont, Massachusetts and very lately in Maine, this subject has attracted the attention of economists. Connecticut has been eminently successful in her efforts: -in 1825, in the town of Mansfield alone, in that State, the silk manufactured was three bundred pounds-valued at fifteen is receipt to enable them to convert such as are thousand dollars :- in 1826, the County of Windham manufactured silk to the amount of fiftyfour thousand dollars. It is estimated that five thousand dollars' worth of silk is annually sold in one County, (Orange County) in New York; and ne day, otherwise it will take more sogar, the whole sale of this article in that State, is cald will not be so neat a wine as if the whole oper- culated at fifteen thousand dollars. When it is considered that the greater part of the labor may be accomplished by females and children, and that it is not only a healthful exercise, but an agreeable amusement, it will be thought a little The product of another insect, the caterpillar supprising, that we are so willing and ready to import silk from abroad.

Agave Americana .- At a late meeting of the 19 raising of silk-worms engaged the attention of New York Horticultural Society, Mr. Saltus preremperor of China, so long ago as twenty-seven sented an Agave Americana and a specimen of hadred years before the Christian era; and an the Hemp manufactured from it, accompanied by

Port au Prince, May 3, 1831. SIR-Referring to my respects of the 20th ame an employment for females generally, ult. I have the pleasure now to forward you pr.brig her the quantity of silk manufactured was Onslow, the plants you requested. Kegs could nicient to clothe all classes in China, it was not be procured, but I loop they will arrive equal-

The mode used for preparing this grass or inions to every part of Asja. In 555, two hemp for market is very simple a piece of timiks brought from China in their hollow staves, ber similar to that used by curriers in cleaning worms' eggs to Constantinople; and thus Eu- skins at a certain period of the process of tauer first became possessed of the power of rais-ing, is arranged; the green leaves or shoots are n silk. In Greece, as in China, females of the placed on it, and with a piece of hard wood, formfamilies commenced the care of silk-worms ed something like a drawing knife, an end in each It to Greece, Italy attended to the rearing of hand, the green and juicy substance is rubbed be insects. About the year 1600, Henry IV. off; the white fibres remain and only require drying to be fit for sale.

> Should these roots get to hand in good order. I beg your acceptance of them, and am, Very respectfully, your

Obliged Servant.

II. PHELPS.

N. SALTUS, Esq. New York.

Horticultural.-Those who grafted their fruit see whether the bandages do not require taking off :-- and whether young shoots from the nating with the Agricultural Society of Ba- stocks are not depriving the grafts or inocu-1. Prussia and Sweden also, have not been lations of their portion of the sap. If so, they and in the former of these, it has been proved, should be cut off; but care should be taken silk equal to that of Italy may be produced, at first, not to trim off all the shoots so as ding greater profit than any other branch of to leave the stock without leaves, for fear of stagindustry;' while that raised in the latter nating the sap and causing the death of both graft

Important Improvement in the Production of Cream .- For about twelve months past Mr Samuel Davis of this city has been trying experiments on the use of milk pans made of zinc as a substitute for those of tin or other materials. His experiments, last summer, on Long Island and New Jersey, were highly satisfactory. He and another gentleman interested, have repeated them this spring, with results equally favorable. They have ascertained that milk in zine pans will keep sweet four or five hours longer than in those of other materials, and consequently afford a longer time for the cream to rise.

On Wednesday, the 25th inst, we saw 3 tin and three zine pans having in each nine quarts of milk. The milk, which was just from the cows, had been put in on the Monday previous at three o'clock in the afternoon. On Wednesday at nine in the morning, when we were present at the skimming, the milk in the tin pans had become mostly coagulated or loopard; that in the zinc pans but slightly sour. At two o'clock this latter afforded a second skimming. The result of the churning was, that the cream from the zine produced three lbs, five oz. and that from the tin only two pounds five and a half ounces. Care was taken to have the experiments correct and fair. In addition to the extra quantity, the butter from the zine vessels is thought to be sweeter.

We do not know on what principle to account for this effect, except it may be that of galvanic agency. The importance of the improvement will at once be perceived by every one. The pans are very durable, not likely to rust or oxidize, and at a price very little higher than those of tin.

Pans and kettles of every description are manufactured by the proprietors of the patent, Messrs. John Westfield & Co. No. 163 Mott street, New York. We hope farmers will lose no time in form-hing themselves with one or more pans to try the experiments .- N. Y. Farmer.

Pendulum Churns,-We should suppose one of the easiest hand churns in use, is that operating by a pendulum. A child of eight or ten years old can sit down and move a double churn without difficulty, during the time requisite to produce butter. A patent has been recently taken out by persons in this city, and extensive sales made. It is, if we are not greatly mistaken, an old invention .- N. Y. Farmer.

Different Flowers on the same Stock,-The new Monthly Magazine gives the following methof obtaining flowers of different colors on the same stem : Split a small twig of elder length ways, and having scraped out the pith, fill each of the apartments with seeds of flowers of different sorts, but which blossom about the same time; -surround them with mould, and then tying together the two bits of wood, plant the whole in a pot filled with earth properly prepared. The stems of the different flowers will thus be so incorporated as to exhibit to the eye, only one stem, trees in the spring, should look them over and thowing out branches covered with flowers analogous to the seed which produced them.

> Insects.-The Curculio continues his ravages upon the plams, apricots and nectarines; most of which are already destroyed in this neighborhood. The yellow bugs which destroy melons and cucumbers, have been foiled by the aplication of coal dust, and appear to have deserted our gardens .-Genesee Farmer.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, JULY 6, 1931.

FOR THE NEW ENGLANOFARMER.

ON PARSNIPS.

As there is no inconvenience in giving to a subject a little forethought, I beg to say a few words respecting Parsnips; notwithstanding the time for preparing the ground for a large crop this year has passed. But a small quantity may be raised even this year, by way of experiment; and some parsnip plants may yet be set out for seed, to be gathered in the fall for a full crop in 1832, should the experiment of the present year prove encouraging."

Deep ploughing may be expected to be requisite for every plant with a tap root; but the ploughing must be deeper for parsnips than for carrots, to prevent the shooting out of large side roots, which would not only render the parsmp inconvenient for harvesting, and for handling afterwards, but diminish the central roots, in which its nourishment chiefly lies. 'This deep ploughing, however, will bury many weeds, put out of the way many insects, and prepare the ground for wheat and other important crops, especially those having deep roots. The plant in question affords a variety to the farmer, in his culture, to meet the accidents of seasons, as well as a variety in their food to some of his farming stock.

The parsnip also, when harvested properly, is not readily affected by first. It requires no animal or vegetable manure, and may be cultivated, with proper care, for several years on the same spot. We have not as yet, perhaps, had much trial of parsnip crops among the farmers of the U. S. but if we trust to English accounts, they are valuable for horned canle, swine, and horses, and are likely to merit attention here, where (es pecially to the castward) parsnips may be raised to great perfection in garden culture, as the writer of this article cheerfully testifies.

Mr Arthur Young shall be our principal evidence as to the general merit of a parship crop on a farm; and my citation from him will be taken from the tenth edition of his Farmer's Culendar, printed in London in 1815,-Ilis words are as follows:

Of all the crops which the farmer can cultivate, the parship is the most valuable; but it deinto the ground. If he has not land of an extraordinary quality he had better not venture on the culture. They love a very deep soil, dry, sound, friable, sandy loam; ploughed as deeply as possible, towards the end of autump, and left for the frost to pulverize and sweeten. About the 10th of February [he here speaks of England] if the weather be favorable, it will be proper to sow and harrow in five pounds of seed per acre, which will come up in about six weeks.

Under the head of the month of March. Mr Young adds the following paragraph. 'Early in this month parsnips are to be sown. They are not to be recommended except in the deepest and richest soils. The land should be dry, but very fertile.-The putrid, rich deep sands, worth 40 or £50 an acre; the deep, friable, sandy loams that are as good two feet deep as on the surface,

* This was intended for last week's paper, but received too lete for publication .- EDITOR.

land, can pay better. Where the soil is proper, stiff loam, and ploughed it in, he found it answerthe inducement to cultivate them is very great; for ed very well; from which he concluded that a they will fatten bullocks as well as oil-cake, and mixture of soils may be proper for this root.* are excellent in fattening logs. Of all common roots they are the most saccharine.

Four or five pounds of seed is the proper quantity, sown broad cast; and the first week of this mouth the right time,-If the weather is favorable they may be sown the last week in February; and harrowed in. Both these roots have been tried in drilling, by very skilful drillers; but they have not answered like broad-east crops .- Nothing prepares better for wheat, if due attention be paid to keeping them entirely clean.

We here take leave of Mr Arthur Young himself to notice a part of the report of a certain Mr Budd, a considerable farmer, near Guilford. in Surry, in England, cited in Mr Young's Calendar. Mr Budd found the parsnips valuable for his hogs, his dairy cows, and his horses; saying that five of the latter gained him each, half a guinea a week for ten weeks, besides saving him hay.* An ox had a most unusual quantity of fat within him, besides making admirable meat. [See Arthur Young's Calendar as above p. 92-94, 135,

In Monk's Agricultural Dictionary vol xi, p 272-275, we have an addition to these accounts. but with some variation. The first article is from Mr J. Hazard, who writes thus,

'To cultivate parsnips so as to make them advantageous to the farmer, it will be right to sow the seeds in autumn, immediately after they are ripe, or come to perfection; by which means the plants will appear early in the following spring, and will get strong before the weeds can grow to injure them. Frosts never affect the seed, nor do the young plants ever suffer from the severity of the seasons. Not only on this ground but for many other reasons the autumn is preferable to the spring sowing, as the weeds at this latter time will keep pace with the parsnips; and often when they are hoed or cleared, great part of the crop is pulled up, cut out, or otherwise destroyed, as (when sown in the spring) they are so small, when they first appear, as not easily to be distinguished from the weeds. If no rains fall at that season some of the seeds will not vegetate, till late in the summands a better soil than any other crop he can put mer; and the few plants which do appear will searcely pay the expense of cleaning them. Besides they will never grow to any size, but be sticky, or cankered, and consequently will be destitute of nutrimental juice; while on the contrary those which are sown in autumn will be

'The best soil for parsnips is a rich deep loam: next to this is sand; or they will thrive well in a in stone, gravel or clay soils, and they plways are largest where the earth is deepest. Dry light land is pleasing to them; but stiff or bide-bound land is destructive. If the soil is proper they do not require much manure. A very good crop (says the writer) has been obtained by himself for three successive years, from the same land without using

are the soils fittest for this root. On these they any manure,-but when he laid sand, at the rate come to a great size; and no other crops on such of about forty cart loads per acre, upon a very

It is best to sow the seed in drillss at about 18 inches distance from each other, that the land may 'The tillage and management is the same as be more conveniently hand or horse hoed; andt hey for carrots, but they demand deeper plonghing, will be more luxuriant if they undergo a sound hoeing, and are carefully earthed, so as not to cover the leaves.

If people would in general be attentive to the soil, the season for sowing, the cleaning and earthing up of the plants, and raising their seed from the largest and best parsnips (which should be selected and transplanted for that purpose,) there is no doubt such a crop would answer better than a crop of carrots. They are equal if not superior for fatting pigs, as they make their flesh whiter: and the pigs eat them with more satisfaction. When they are clean washed, and sliced among bran, horses cat them greedily.' Bath Papers, vol. iv. 1788.

Another writer in the same volume of the Bath papers, says 'I am of opinion that there is a plant, I mean Pursnip, which has not been yet tried by any of your correspondents .- but which is in France, and in our adjoining islands (in the British channel) held in high estimation as a food, particularly for cattle and swine. In Britany [in France] especially, they mention it as little inferior in value to wheat. whilst cows fed with it in winter (say they) give as good milk, and which yields as well flavored butter as milk in May or June; and in as great abundance. It is much commended for swine, which rear young pigs. It also proves very useful in fattening pigs.

Here end our citations from the Bath Papers.

After the reference just made to French farming on the subject of parsnips, something might have been expected to have been found in the Maison Rustique; but in its tenth editon (in 1775) pothing of moment appears; except that parsnips are said to be of two kinds, white and yellow; and that more apprehension is expressed of frost acting upon the crops, put up for keeping, than Dr Deane seemed to think necessary in his edition of the New England Farmer for 1790.

Though the experience of the writer of this letter only regards the parsnip in garden culture, in the northern part of the Union, yet this experience proves that the Parsnip may be cultivated with spring sowing, like the carrot. It may be added also that the Surrey Farmer (Mr Budd above mentioned) varied his mode of giving his parsnips to his animals, when he found them for the moment glutted with them. And lastly, let it be recollected, that a variety of farms have spots of deep soil, which their annual crops never black gritty soil; but will never pay for cultivation employ down to its bottom; and that it is so much gain to a farmer, when any of this deep soil is brought from time to time into extra use.

I am, Sir, your constant reader, S. 0. Hallowell, June 1831.

[&]quot; If parsnips, like carrots, when given alone furnish weight of carcase rather than strength; then should immediate service be required, strength and buttom may easily be gained by a mixture of more heartening food with the root in question.

^{*} It is an established rule that the proper mixture of soils by art, is in the first instance equivalent to manure; or is a permanent manure. Manure which is absorbed may be added.

The only reason for taking up the plant, when It is destined for producing seed, is to have the power of selecting the best; but when it is known that the plants are all good, to transplant them is doing much mischief and losing time.

BE ES.

Mr Fessusper-It is proper that those persons who make use of the bee-hive furnished with glazed Drawers, should be informed that they will find it lifficult to drive the bees out of the drawers while aking the honey, unless the glass be covered; but f the drawers be entirely dark, the bees will immeliately rush out at the aperture by which they entered.

In case of receiving a sting, there is no remedy hat affords such speedy and effectual relief as to-

acco moistened with vinegar.

I have four swarms that have this season taken ossession of contiguous empty hives without swarmng in the usual mode. It is only necessary to place nives in contact with apertures of communication, nd to keep the empty hive dark without any outlet n front. I am yours,

Plymouth, July, 1s31.

J. T.

Fat Cattle .- Col. Stevens, of Dutchess county, V. Y. passed through this village last week with about 90 head of cattle, for the New York barket. He informed us that he had paid 70,000 ollars this season for cattle purchased in the viciny of Connecticut river, in Massachusetts, New Jampshire and Vermont .- Northampton Gazette.

The season .- This is a growing season, and a ery busy one for farmers. Corn and broom corn re unusually promising. There is a great crop of rass, but the weather has been unfavorable for ay making. Many fields of rve, it is said are lasted .- Ibid.

Corn Bug .- The Lansingburg Gazette states, hat a black bug, about the size of a lightning bug as recently made its appearance in the neighborood of that village - and says that it is the worst nemy to corn the farmers have ever known, Vhole fields have been destroyed by it.

Why Cream collects on the surface of Milk .- When vessel of milk is allowed to remain a certain time t rest, it is observed that a stratum of fluid will ollect at the surface, differing in many qualities om that upon which it rests. This is called eam; and the property by which it ascends to ie surface is its relative levity; it is composed of ie lightest particles of the milk, which are in the rst instance mixed generally in the fluid; but hich, when the liquid is allowed to rest, graduly rise through it, and settle at the surface .r Lardner's Cabinet Cyclopædia.—Hydrostatics nd Pneumatics.

Temperance in New Hampshire .- According to late report of the N. H. Temperance Socity, as given in the N. H. Statesman, the conimption of ardent spirits in that State has been educed in the proportion of about 4-9ths, making n annual saving of expenditure in this article of 268,000. The present consumption is estimated t 2 gallons to each individual, at an annual cost f 8335,000. - B. Falls Int.

The first edition of Halsted's Dyspensia, 10,000 opies, having been sold, another of 1000 is just ublished.

Wrought-Iron Ploughs .- Bar-Iron, &c.

Wrought-Iron Ploughs, of all sizes .- Also, A Complete sortment of American, English, Swedes and Russia Bar on-American Braziers' Rods-Spike and Nuil Rods, hoe-Shapes-Hoop and Band Iron-Steel of all kindsripe-box and Mould-board plates, &c. constantly for sale QAY & BIRD,

No. 44, India Street, Boston.

The Subscriber has 300 swarms of Bees for sale, in his Patent Slide Bechives, at 20 cents per pound, weight of Pearing & Co., No. 110, State Street, each swarm from 10 to 100 lbs, tare of live deducted; April 13, 1831. 6w. the price of the Patent hives is \$2 a piece, and the price of a single right \$5.

Also for safe, 200 swarms of bees in the old tashioned hive, price 17 cents per pound, tare of hive deducted.

The above will be delivered within fifty miles of Boston, in good order, (warranted free from moths or otherwise damaged) by the first day of March, 1832.

All letters must be sent in before the first day of Sepember, 1831, so as to have time to transport them from EBENEZER BEARD ep2m

Brass Syringes.

For sale at the Agricultural Warehouse, Nos. 51 and 52 North Market street, a very useful article for destroy-Likewise to ing Caterpillars, Bugs and other insects. prevent the mildew on Vines and Gooseberry Bushes .-See N. E. Farmer, vol. 8, page 358 and 363.

Turnip Seed.

For sale at the Seed Store connected with the New England Farmer, No. 52 North Market Street, Boston, 200 lbs. White Flat Turnip Seed, the growth of the present season, raised in this vicinity expressly for this Establishment.

Also-Ruta Baga of the very first quality, of both American and European growth; Vellow Aberdeen, Yellow Stone, White Norfolk Field, and Yellow French Turnips; Long Prickly and other Cucumbers, for pickling, warranted gennine and fresh. iuly 6

Farm Wanted.

Wanted, a first rate Farm in the vicinity of Boston, containing 100 to 150 acres of land, with a good and convenient house, barn, &c.

Letters (postage paid) addressed to R. S. H. Salem, Mass, giving a particular description of Farms, offered, cash piece, taxes, &c, will receive immediate attention. The true Sugar Beet.

For sale at the New England Seed Store, 52, North Market street, Boston, 100 lbs. of the true French Sugar Beet Seed,-received this day from Paris. by the last Havre packet, via Newport. The excellence of this poot for eattle, and for culinary and other purposes, is too well known to require comment.

ALSO-Large and Small Lima Beans-Early Dwarf Beans—several varieties of pickling and other Cucumbers—Radishes, Lettuces, Cabbages, Turnips, &c.

BROOM CORN.

Also, just received, a few bushels of prime Broom Corn raised last season in the vicinity of Connecticut river.

Sheep - Sheep. Valuable Books on the best method of forming good flocks, of increasing them, and treating them properly when in health and when diseased-on the character and value of Merino Sheep-anatomical structure, &c, &e-5 valuable works, viz:

Sir George Stewart Makenzie, Bart.

Brighton Market-Monday, July 4. [Reported for the Chronicle and Patriot.]

At Market this day 189 Beef Cattle; 1606 Sheep and Lambs, and 57 small pigs. About 50 Beef Cattle came in last week, after Monday, and were sold.

PRICES .- Beef Cattle-We quote today from \$4.50 to 5 50. A few pairs extra brought a trifle more.

Sheep and Lambs-Sales were noticed at 2.75 2.88. 2 92, 2 121, 2 25, and \$2 33. Some wethers were at market, but we did not learn the price at which they

Swine-No sales notleed.

MISCELLANY.

THE THREE HOMES.

'Where is thy home?' I asked a child,

Who, in the morning air, Was twining flowers most sweet and wild,

In garlands for her hair. " My home," the happy heart replied,

And smiled in childish glee, ' Is on the sunny in auntain's side,

Where soft winds wander free." O, blessings fall on artless youth,

And all its rosy hours, When every word is joy and truth, And treasures live in flowers

' Where is thy home?' I asked of one, Who bent with flushing face. To hear a lover's tender tone In the wild wood's secret place. She spoke not, but her varying check

The tale might well impart ; The home for a young spirit meck

Was in a kindled heart. Ah! souls, that well might soar above, To earth will fondly cling,

And build their hopes on human love, That light and fragile thing.

'Where is thy home, thou lonely man?' I asked a pilgrim grey, Who came with furrowed brow and wan,

Slow marching on his way. He paused, and with a solemn mien, Upturned his holy eyes.

'The land I seek thou ne'er hast seen. MY home is in the skies!"

O! blest, thrice blest! the heart must be, To whom such thoughts are given, That walks from worldly fetters free;

Its only home is heaven.

NATIVE SILKWORMS.

We are informed that a lady near Georgetown, D. C. has a couple of cocoons of the native silk. worm, of so extraordinary a size that a description of them and the fly that has come out of them is deemed worthy of publication. The cocoon is fully as large as a turkey's egg, and resembles that of the common silkworm, in other respects, except in the fibre, which looks like flax. The fly is very beautiful, and very large, the size of a wren. Its anteneze are black, legs and back red, body striped. It measures between the extremities of its wings six inches. We should be glad to obtain the flies for preservation; and if they shall have produced eggs a few would be very acceptable .- .- .- Imerican Farmer.

Intemperance.-The following information is derived from an examination of the records of the office of the county clerk of Rensselaer, and has been communicated by the clerk :-

That during the year 1830, 705 paupers have received public charity of the expense of \$7871 13; and that from an accurate investigation, nine tenths of the expenditure was traced to the use of ardent spirits; so that the county during the year has been put to the expense of \$7084 25 to support its drunkards or paupers thrown upon the public by drunkenness, while only \$787 13! has been required for the support of all others, claim- another in front, displaying Lost my horse and ng public charity from old age or providential cart.' A crowd followed him, and he had not gone imability - Ontario Rochester.

Good advice.-The following advice from Madame Terein, a lady of great literary attainments, given to Marmontel, when a young man, with respeet to authorship, should be a perpetual lesson to writers by profession. 'Secure yourself,' said she, 'a livelihood independent of literary successes, and put into this lottery only the overplus of your time for wo to him who depends only on his pen! Nothing is more casual. The man who makes shoes is sure of his wages ; but a man who writes a book, or a tragedy, is never sure of anything.'-Life of Marmontel.

The dearest is always the best .- In the western part of Massachusetts, where oak abounds, pine is preferred and generally used in constructing pumps for wells; in this part of the State where pine can readily be procured, oak, which it is very difficult to obtain, is estremed the best and commonly used for that purpose .- Barnstable Journal.

A farmer having lost his horse and eart in New York, pinned a sheet of paper on his back, and far before he heard of his property.

Valuable and Cheap Land-for Sale.

The subscriber offers for sale, 14,000 acres of choice Land, situated in the town of Pinckney, county of Lewis and state of New York. Some of the land is improved and under cultivation. The country is remarkably healthy, being entirely free from the fever and ague and from the common bilious fevers which often afflict the towns upon Lake Ontario, this town being 18 miles east of thelake. The soil is principally a sandy toam, much of it covered with such black mould. The timber is chiefly Sogar Maple, Black Ash, Butternut, Beech, Elm, &c. The land yields first rate crops of Grass, Rye, Oats, Barley, Potatoes and Flax; and on some lots, good Wheat and Corn may be grown. To those wishing to obtain superior grazing taims, a fine opportunity now offers itsell, The produce of pasturage and hay from an acre of this land, is very large, fully equalling if not surpassing that from the same quantity of land in any other of the Black River townships. The land is admirably well watered, 929,015 River townships. The which have not durable running streams upon them. The land is well adapted to Orcharding—the Apple tree thriving very well in this county. Stock of all kinds may be disposed of with the least possible trouble, and to the greatest advantage, the drovers purchasing at the very doors of the farmers, and paying the highest cash prices for their cattle, which will readily 474.857 find purchasers at all seasons of the year. Several farmers at present residing on this town, were originally from the New England States, and some of them from Massachusetts, who are in thriving circumstances. The above described land is offered for sale at the very low price of from two dollars and a half to three dollars per acre, for the uncleared land, and from three dollars and a half to five dollars and a half for the improved lots. The land will be sold in lots to suit purchasers, and from two to five years' credit for payment in annual instalments, will be given. As a further convenience to purchasers, the subscriber will receive in payment, Cattle, Sheep, Perk, Grain or Grass Seed, for which products he will allow the highest cash prices. The title to the land is indisputable, and good Warranty Deeds will be given to purchasers. Persons desirons of purchasing will please to apply to the subscriber, at Henderson Harbor, county of Jefferson, State of New York, or to DAVID CANFIELD, Esq. on the town. JAMES H. HENDERSON. FOR THE NEW ENGLAND FARMER.

MANUFACTURE OF CHEESE.

MR EDITOR -If you think the following answers rennet is put to it? to the questions in the New England Farmer, vol. ix. p. 313, are worth publishing, they are at your disposal; they are compiled from various publications and the unwritten opinions of those experienced in the manufacture of Cheese. There are, no doubt, some errors, and the compiler would be highly pleased to have them pointed out for the the rennet is put to it? good of the public.

Windham, Con. July, 1831.

1. What effect has it on milk, in hot weather, if it is much agitated and heated in the udder, by the ow's being driven a long distance, or running about?

It greatly injures the milk; it is very difficult to nake it into cheese, and instead of one hour (the ime very commonly given by dairy-women in oringing the cheese) it will frequently not come n 3, 4, or 5 hours, and then in an imperfect state; nd when the cheese is released from the press it vill heave or puff up.

2. Which is the best method to keep milk sweet over ight in warm weather ?

Set the milk in small brass, or tin vessels, and ut one table spoonfol of fine salt to each gallon, nd pour in some cold water according to the heat f the weather; let the milk stand where there is ie cream and mix it thoroughly with the warm torning's milk.

3. Which is the best method to preserve rennet skins? Let the calf suck about 11 hours before it is illed. Take out the maw-skin, and let it lie ree hours in a cool place, then empty the maw. et no water touch it,) and rub it well with salt on ich side, and afterwards cover it with salt, and the milk? it it in a bowl; turn and rub it every day for out three days, then open it to dry, being etched out on a stick, that it may dry regularly. It is of great importance that the maw skin be ell prepared; good cheese cannot be made with d rennet. It is reckoned best to be one year I before used; it will fetch more cheese, and it is id the cheese will be milder. To prepare the nnet, make 2 quarts of brine that will swim an g; when the heat is gone off to about blood urm, put in one maw-skin-cut in pieces, let it ep two days (48 hours) then strain and bottle it. 4. What quantity of new cheese will one rennet in produce?

The average about 250 lbs, (some produce 600 curd?

5. How many quarts of milk (milk measure) will duce curd for a cheese which will weigh 15 lbs. m the press?

Fortyfive to 60 quarts, according to the richness spread and will not cure well. the milk.

6. What will a cheese which weighs 15 lbs. from pressed? press shrink the first five months after it is made? Near three pounds. (A cheese which weighs 24 green, will shrink 4 lbs. in 5 months.

7. What degree of the thermometer should be he at of the milk when the rennet is put in?

weather, and the quantity of milk. (The smaller the quantity of milk, and the cooler the weather, English when it is cut open? the hotter should be the milk.)

The cheese will partake of the elastic or springing quality of a sponge. It leaves it in a very tough state. It inclues the cheese to heave and white; it spoils the cheese,

9. What is the effect if the milk is too cold, when

It will hardly come at all, and it is not easy to separate the whey, and is in danger in warm weather of souring. The cheese is apt to cut chisselly and break and fly before the knife,

10. How long time should be allowed after the rennet is put to the milk to cause it to turn to curd fit for the cheese knife?

One hour in warm sultry southwesterly weather, and not less than one and a half hour in clear northwest weather.

[Cheese will come in warm weather quicker than in cool, with the same quantity of rennet, as it does not cool so quick. When the whey looks blue, the card is fully formed and the whey may be curefully separated.]

11. What is the effect if the curd is stirred, or broken too soon?

The rennet will not take full effect. It will free circulation of air. In the morning take off cause slip curd, which will never make good cheese. The cheese will be unsettled and ill flavored. The whey will be rich, and the cheese poor.

12. What is the effect if too much rennet is put to the milk?

The cheese will be rank, or very strong, and is liable to heave and spread,

13. What is the effect if too little rennet is put to

It works too slow, and is liable to become sour in warm weather.

14. What kind of salt is best for cheese?

The very best of Blown Liverpool salt.

Some prefer the best of Rock or Turks Island salt, washed and ground.

15. What quantity of salt should be put to the curd which will make a cheese weighing 15 lbs. from the

About six ounces. (If a cheese of 15 lbs. is salted when turned in the press, and afterward put in a brine 15 hours, 1 oz. of salt to the curd will be sufficient.)

16. What is the effect if too much salt is put to the

The cheese will be hard, dry, poor, and warty. 17. What is the effect if too little sall is put to the curd, or it is not well cured in brine?

The cheese will taste strong, be liable to heave,

18. What is the effect if cheese is not sufficiently

The cheese will crack, leak, mould and rot.

gradually to the utmost power of the press. If intended for them. If there is a queen in the new cheese is not scalded right, and well mixed, we hive, the sentinels will be seen huzzing at the encannot by pressing make it firm. If cheese is trance within 24 hours. Some preferring it at From 80 to 90, according to the heat of the pressed too much it is apt to be hard and poor.] noon, others in the evening .- Vt. Chronicle.

19. Why does American cheese dry sooner than Whether it is because they mix a little salt-S. What is the effect if the milk is too hol when the petre with the salt, or one them in brine, without putting much salt to the curil, or it is caused by adding suct to the cord, I have no means of

20. Can as good cheese be made upon a farm on be strong. The whey will look green and then the seaboard as in the interior? (See N. E. Farmer, vol. ix. p. 326.)

No doubt, if the manufacturer has as much experience and skill. (Those living near large towns where fresh butter bears a high price, are strongly tempted to skim the milk, before it is made into cheese.)

GENERAL REMARKS ON CHEESE MAKING.

It is recommended to have the milk in the tub measured with a guaging rod, the salt weighed, the rennet measured, and the temperature of the milk when the rennet is added, determined by a thermometer; if there was less guessing about making cheese, there would be less poor cheese

Skimmed cheeses do not require so much scalding as new milk.

If curd for cheese is not well sculded the cheeses will look warty, spread and leak; scald the curd rather more than is generally practised. and then cool it in cold water, the whey will work out more readily. If cheese is put into the press warm, it is apt to puff up, and be strong.

Sorreard will not make good cheese, and sour milk should be given to the swine, cheese made of it would be hard, crack, teak, and be wrinkle conted.

Scalded milk makes rich cheese.

The practice of coloring cheese and butter, we think, should be discouraged; who would thank a milk man to color his milk?

As to cheese hoops for a middling size cheese, let the height be about two thirds of the diameter : for small cheese, let the height be about half the diameter.

Be careful that the room, where rich new cheese is kept in hot weather, be not too warm.

The whey may be let off when the curd is sufficiently formed by a plug at the bottom of the tub; placing something over the hole to keep the curd from stopping it.

Seed Wheel .- A writer in the Va. Herald recommends that wheat intended for seed should become cutirely ripe before reaping; believing it less liable to be injured by the fly, or the winter, He is also 'satisfied that smut is mainly attributed to unrine seed wheat.'

Becs .- The Genesce Farmer recommends a new way of swarming bees. When the hive becomes overstocked, turn it bottom upwards, set an empty hive upon it, and strike gently on the lower hive. till a sufficient number have ascended to their new [Press the cheese gently at first, and advance abode; and then remove both hives to the place

Morticulture.

Proceedings of the Massachusetts Horticultural Institution, on Saturday, July 9th, 1831.

The following letters from the Rev. Henry Colman and Doct. P. G. Robbins, were read. II. A. S. DEARBORN, Esq.

DEAR SIR-I send you with this my Crescent Hoe for garden purposes, and particularly for weeding and thinning carrots, turnips, onions and small placts. I have found it very useful and better adapted to these purposes, than any other known to me. Its advantages are that while it loosens the ground it leaves it smooth; by being pointed it is easily inserted among the plants; and being curved at the ends it enables you to extract by a side-stroke ferent varieties was presented by Mr N. Seaver of lived beside a drove road the better part of my weeds, which could not be removed by a forward blow without destroying the plant. It is a small affair, but is very convenient and will save trouble.

After laying it on the table of the Horticultural Society as long a time as you think proper, please appropriate it to your own use. It cannot be in better hands.

Very truly and respectfully,

Your friend and servant, HENRY COLMAN.

Salem, July 9, 1831.

SECURITY AGAINST CANKER WORMS. To the President of the Massachusetts Horticultural Society

DEAR SIR-Last autumn, I communicated to the New England Farmer, a method, which I had planned two years ago, for protecting my appletrees from canker worms, by means of leaden gutters filled with some fluid, over which the grub could not pass. I have tested the experiment, and beg leave, as an act of duty and pleasure, to report to you the result.

In October, 1830, I applied gatters, (in the manner mentioned in a former publication, N. E. Farmer vol. viii, page 385) around the trunks of forty apple-trees and one English walnut tree; not knowing that the latter was everingured by the grub. At first I filled the troughs with lamp oil. The moment the insect plunged into the canal, the oil closed its spiracles, and all its vitality ceased. The first fortnight in November, I was obliged to elear the gutters as often as once in two or three days, or the dead insects would have furnished a bridge, over which the living could have passed.

too expensive ;- for the rains would float it away. I then tried a solution of salt and water,-also strong ley .- These fluids, though not so immediately fatal to the enemy, soon overcame him.

I have three English walnut trees in my garden, On one of them, as before stated, I placed a guard. This was completely protected; the others were eaten, and one of them as completely unleaved as it ever was in mid-winter. Although my apple-trees, the present year, are not all in bearing, (having been severely handled, from foes their verdure is as perfect as I ever saw it, and some of them promise to yield abundantly.

With much esteem and respect yours, G. P. ROBEINS, Roxbury, July 9, 1831.

Resolved, That the thanks of the Society, be presented to Capt. M. C. Perry, Commander of nean.

Resolved, That the thanks of the Society, be presented to Capt. Th. Holdup Stevens, Commander of the U. S. Ship Ontario, for a valua-Society at a meeting, held in the Hall of the bly collection of grape vines, and melon seeds, obtained in Smyrna.

man of Yucca filamentosa, or Adam's thread, From Messrs Winships of Brighton, a large collection of Flowers, and several fine plants of the Gardenia Florida, in pots.

From Mr G. W. Pratt, a fine specimen of the Gloxinia caulescens.

[Omission.]

The following notice which was prepared and designed for the New England Farmer two weeks since miscarried by some accident.

Horticultural Hall, June 25. Fruits. - A large and very fine banch of Sweet Water Grapes, to appearance perfectly ripe at this unusual period, was exhibited by John Prince, Esq. Samples of very fine large Gooseberries, by Mr I found oil, though effectual for my purpose, Z. Cook, Jr. and a specimen of very fine Black Tartarean Cherries from Mr Fosdick of Charlestown.

Preserved Fruit,-Collect your Gooseberries about the middle of June and July, pick them as you would for present use, and put them quite dry in bottles, the neck large enough to receive them without bruising; then place them in a kettle of precipice, the lake, the pool; and all dangers whatcold water, which boil, let them remain in this water 10 or 15 minutes, then take them out, and after they have remained long enough to get perfectly cool, cork the bottles closely, then put them without and foes within, the last five years) yet away in a cool place for use. Currants may be preserved green in the same casy manner.

Fullen Fruit .- Be very careful to gather all punctured or decayed fruit, whether on your trees or on the ground, and give them to your hogs. If you do not, the worms which they contain, and which have been the cause of their premature dethe U. S. Ship Concord, for a collection of seeds cay, will make their escape into the ground, and will increase upon you another season.

ANECDOTES OF SHEEP.

BY THE ETTRICK SHEPHERD.

The Sheep has scarcely any marked character save that of natural affection, of which it possesses a very great share. It is otherwise a stupid, indifferent animal, having few wants and Corresponding, Capt. Th. Holdup Stevens, fewer expedients. The old black faced, or forest breed, have far more powerful capabilities than The grape vines and seeds, presented by Cap- any of the finer breeds that have been introduced

> I have heard of sheep returning from Yorkshire to the Highlands. This is certain, that when one, or a few sheep, get away from the rest of their acquaintances, they return homeward with great eagerness and perseverance. I have life, and many stragglers have I seen bending their steps northward in the spring of the year. A shepherd rarely sees these journeyers twice, If he sees them, and stops them in the morning, they are gone long before night; and if he sees them at night they will be gone many miles beplace of their nativity is much more predominant in our aboriginal breed, than in any of the other kinds with which I am acquainted.

A shepherd in Blackhouse bought a few sheep from another in Crawmel, about ten miles distant. In the spring following, one of the ewes went back to her native place, and yeaned on a wild hill called Crawmill Craig. On a certain day about the beginning of July following, the shepherd went and brought home his ewe and lamb-took the fleece from the ewe, and kept the lamb for one of his stock. The lamb lived and throve, and never offered to leave home, but when three years of age, and about to have her first lamb she vanished; and the morning after the Crawmel shepherd, in going his rounds found her with a new-yeared lamb on the very gair of the Crawmel Craig, where she was lambed berself. She remained there till the first week of July, the time when she was brought a lamb herself, and then she came home with hers of her own accord; and this eastom she continued annually with the greatest punctuality as long as she lived. At length her lambs, when they came of age, began the same practice, and the shepherd was obliged to dispose of the whole breed,

But with regard to their natural affection, the instances that might be mentioned are without number, stupid and actionless creatures as they are. When one loses its sight in a flock of short sheep it is rarely abandoned to itself in that hapless and helpless state. Some one always attaches uself to it, and by bleating calls it back from the

There is another manifest provision of nature with regard to these animals, which is, that the more inhospitable the land is on which they feed, the greater their kindness and attention to their young. I once herded two years on a wild and hare farm, called Willenslee, on the border of Mid Lothian, and of all the sheep I ever saw, these were the kindest and most affectionate to their young. I was often deeply affected at scenes which I witnessed there. We had one very hard winter, so that our sheep grew lean in the spring. and the thwarter-ill, (a sort of paralytic affection) which he kindly transmitted from the Mediterra | you will find the evils which await their visitations came among them, and carried off a number. Often have I seen these poor victims, when fallen seen aught more painfully affecting.

It is well known that it is a custom with shepherds, when a lamb dies, if the mother have sufficiency of milk, to bring her in and put another lamb to her. I have described the process somewhere else-it is done by putting the skin of the dead lamb upon the living one, the eye immediately acknowledges the relationship, and after the her two or three times, she accepts and nourishes it as her own ever after. Whether it is from joy at this apparent reanimation of her young one, or a little doubt remaining on her mind that she would fain dispel, I cannot decide, but, for a number of days, she shows far more fondness, more bleating, and caressing, over this one, than she did formerly over the one that was really her own.

that such sheep as thus lose their lambs must be driven to a house with dogs, so that the lamb may be put to them; for they will only take it in a dark confined place. But here, in Willenslee, I never need to drive home a sheep by force, with ring the winter. dogs, or in any other way than the following :--I found every ewe, of course, standing hanging her head over her dead lamb, and having a piece of twine with me for the purpose, I tied that to the lamb's neck or toes, and trailing it along, the ewe followed me into any house or fold that I chose to lead her. Any of them would have followed me in that way for miles, her nose close on the lamb, which she never quitted for a moment, except to chase the dog, which she would not suffer to walk near me. I often, out of curiosity, led them in to the side of the kitchen fire by this means, into the midst of servants and dogs, but the more the dangers multiplied around the ewe, she clung the closer to her dead offspring, and thought of nothing but protecting it.

From Loudon's Encyclopedia of Agriculture.

Sheep in Spain.-The sheep in Spain have long been celebrated. Pliny relates, that in his time Spanish cloths were of an excellent texture, and much used in Rome. For many centuries the wool has been transported to Flanders, for the supply of the Flemish manufactories, and afterwards, to Eugland, when the same manufacture was introduced there. By far the greater part of Spanish sheep are migratory, and belong to what is called the mesta or Merino corporation; but there are also stationary flocks belonging to private individuals in Andalusia, whose wool is of equal fineness and value. The carcass of the Sheep in Spain is held in no estimation, and only used by the shepherds and the poor.

The flocks which form the mesta usually consist of about 10,000 sheep. Each flock is under the care of a directing officer, fifty shepherds and fifty dogs. The whole flock composing the mesta, consist of about five millions of sheep, and employ about 45 or 50,000 persons, and nearly as many dogs. The flocks are put in motion the latter end of April, or beginning of May, leaving the plains of Estramadura, Andalusia, Leon, Old repair to the mountains of the two latter provin- cultivated, the injury done to the pasture and by their business; and wool will be imported in

tity they please,

dissolved in water. This practice is founded leges of the mesta were greatly reduced, upon an ancient custom, the reason of which is not clearly ascertained. Some suppose that the othre uniting with the oleaginous matter of the fleece, forms a kinds of varnish which defends skin has warmed on it, so as to give it something the animal from the inclemency of the weather. of the smell of her own progeny, and it has sucked Others think the ponderosity of this earth prevents the wool growing too thick and long in the staple. But the more eligible opinion is, that the harsh and coarse.

Towards the end of September, the flocks recommence their march. Descending from the mountains, they travel towards the warmer part But this is not what I wanted to explain; it was of the country, and again repair to the plains of Leon, Estramadura, and Andalusia. The sheep are generally conducted to the same pastures they had grazed the preceding year, and where most of them had been yeared; there they are kept du-

Sheep shearing commences the beginning of May, and is performed while the sheep are on mer, as they help to shade the plants, and to keep their summer journey, in large buildings. Those which are placed upon the road are capable of containing forty, fifty, and some sixty thousand sheep. The shearing is preceded by a pompous have written this very erroneous sentence. It is preparation, conducted in due form, and the interval is considered a time of feasting and recreation. One hundred and twentyfive men are usually employed for shearing a thousand ewes, and two hundred for a thousand wethers. Each sheep affords four kinds of wool, more or less according to the parts of the animal whence it is taken. The ewes produce the finest fleeces and the wethers the heaviest; three wether fleeces ordinarily weigh on the average twenty five lbs.; but it will take five ewe flegces to amount to the weight.

The journey which the flocks make in their peregrination is regulated by particular laws, and immemorial customs. The sheep pass unmolested over the pastures belonging to the villages and the commons which lie in their road, and have a right to feed on them. They are not, however allowed to pass over cultivated land; but the proprietors of such lands are obliged to leave for them a path, about forty toises (eightyfour yards) in breadth. When they traverse the commonable pastures, they seldom travel more than five miles or five and a half miles a day; but when they walk in close order over the cultivated fields, often more than six varas, or near seventeen miles.-The whole of their journey is usually an extent of one hundred and twenty, thirty, or forty leagues, which they perform in thirty or thirtyfive days. The price paid for depasturing the lands, where they winter, is qually regulated by usage, and is very low: but it is not in the power of the landed proprietors to make the smallest advance.

The public opinion in Spain has long been against the mesta, on account of the number of ees, and those of Biscay, Navarre, and Arragon cultivated lands of individuals, and the tyranny cloth.

down to rise no more, even when muchle to lift The sheep, while feeding on the mountains, have of the directors and shepherds. ON WEEDING YOUNG CROPS.

'To keep off the sun and bugs from our cucumbers,' was our reply to our neighbor L, who on seeing a parcel of weeds standing in our garden. interrogated us why they were left. We noticed the muscles of his face were a little disturbed, but nothing more passed on the subject. Yesterearth absorbs the superabundant perspiration, day as we sat chatting on various subjects, be took which would otherwise render the wool both up Cobbet's Gardener, and began very accidentally reading his observations on Stocks .- Now there has always appeared to us, to be such a love of quackery in everything, with this man, that many of his observations have been underrated by us. Notwithstanding he has written many very excellent things both in politics and horticulture. Our neighbor L, read as follows:

I cannot help observing here, upon an observation of Mr Marshall : as to weeding,' says Cobbet, though seedling trees must not be smothered, yet some small weeds may be suffered to grow in sumthe ground cool,'

' Mercy on this gentleman's readers! Mr Marshall had not read Tull; if he had, he never would the reof of the weed that does the mischief. Let there be a rod of ground, set with small weeds. and another rod kept weeded. Let them adjoin each other. Go after fifteen or twenty days of dry weather, and examine the two; when you will find the weedless ground moist and fresh; while the other is dry as dust, to a foot in depth; the root of the weed sucks up every particle of moisture. What pretty things they are then to keep seedling trees cool.'

After he was gone, we went to our encumbers. and found that the weeds had not sheltered them from the bugs ; but that they were actually eaten more than those that were weeded, besides they were not as large. We have frequently asked farmers when we have seen their comfields full of weeds, why they did not hoe their corn? and they have answered, because the ground is too dry. It will be found that Cobbet's theory in this respect is correct. The dryer the ground the oftener it should be stirred, even where it is clear from weeds. If your corn is wilting with the drought, hoe it; if your cabbages droop, hoe them; if the bugs eat your melons or encumbers. hoe and manuro them; the more rapid their growth, the less will they be attacked with the bugs. A rusty hoe in summer, is the sign of a had farmer. -Genesce Farmer.

Wool .- The following suggestions in Niles' Register may be deserving of notice just now :

We advise the wool growers to dispose of the stocks which they may have on hand, as soon as they can. We think it impossible that the present price can long be maintained, and if the speculators suffer, we shall not regret it. The manufacand New Castile, where they usually winter; they people it employs, the extent of land it keeps un- turers generally, cannot pay such prices, and live

From the New York Farmer.

SPESUTIA FARM.

The farm, which is the subject of the present article, belongs to Mr W. Smith, of Caltimore, Maryland. The account, which we take from the American Farmer, cannot fail of being read with interest by farmers. One of the leading principles on which this farm is conducted, is not employing an overseer, by which an expense of \$500 is saved, Mr Smith has found the consequence of not trusting bis farm to the management of an overscer, to be an increase of its productions. The experiment is a striking instance of what may be accomplished by systematic regulations. We consider a description of farms to be among the most useful topics for agriculturists: and we should be happy to have communications on the subject for the New York Farmer.

1st. The farm is situated at the distance of about thirtyfive miles from the residence of the owner. This circumstance alone would seem to render an overseer indispensably necessary. To diminish the evils of so great a distance, he has established an invariable rotation of crops, and a systematic arrangement of all the various operations of the farm. With such uniform regularity, as to time, altered only by casualties, are the several pieces of work begun and ended every year, that in visiting his farm, he knows to a moral certainty, in what particular work he will find his people employed, what progress they have, or ought to have made in the general business, and of course what are the indications, if any, of negligence or idleness. All this, it is obvious, evinces, on the part of the negroes, vigilance and industry.

2d. The farm consists of 450 acres of rich upland, and of about 550 acres of reclaimed marsh, which is in progress of being completely drained. That portion of the upland which is un der entitivation, is divided into five equal fields of 70 acres each. The course of rotation is corn, oats, wheat, clover, wheat ; a system too severe, were it not for the abundant supply of manure every spring and autumn. The field in corn is manured throughout every spring, and that field in wheat which is on the oat stubble, is manured partially every fall. The accumulating, the hauling and the spread of such a large quantity of manure require unceasing zeal and industry.

3d. To get out the wheat, oats, and clover seeds there is a costly threshing machine which necessarily requires the utmost vigilance.

4th. The whole crop of wheat, and part of the crops of corn, and oats, are sent every year by water to the owner in Baltimore; so are also sent, from time to time, beef, hams, butter and various other articles for the table.

5th. The operations of ploughing, harrowing, and hauling are performed by breeding mares, which have been selected with a view, not only to their work, but to the value of their progeny. From them there are now on the farm many celts. of various ages, the sales of which constitute a clear annual gain over and above the profit accruing from the labor of their dams. These colts are served by a full blooded horse, owned by Mr S. In the place of this horse has been purchased this spring a beautiful stallion of the trotting breed. a colt of the celebrated Fardown

6th. Besides these working mares, there are two full blooded valuable Virginia mares, and three colts from them-one a much admired two years rious matters, requiring circumspection and fore-

from the Virginia horse Monsieur Tonson. These and for the further purpose of calling attention to colts are also intended for sale as part of the profits the practical details of the management of a farm, of the farm

7th. To this stock of neat cattle, a cross of the Holstein and Bakewell, there has been recently the progressive augmentation and amelioration of added a bull and two cows of the improved Dur- its productions of every nature and kind. ham short horn breed.

8th. On the north side of a long line of stables, sheds and barracks, are three convenient grass lots, and on the south side there are, besides the stack yard, three spacious yards with a few subdivisions for the accommodation of every variety of stock. The full blooded mares, the working mares, the neat cattle, the colts and calves are, during the winter kept in these stables and sheds, and in the yards and lots thereto attached; and they are duly supplied with water from a pump with troughs so arranged as to suit the several vards and lots. The neat cattle are occasionally fed on long necked winter squashes, turnips and potatoes. In addition to these articles of green food they will the ensuing winter, have cow cabbages and carrots both raised in the field. In the cultivation of carrots, Mr. S. has adopted, by way of trial, the plan recommended in a number of the American Farmer of last March, And accordingly on an acre of ground, sowed with the usual quantity of flaxseed, he has sowed, this spring, a quart of carrot-seed. Should this experiment answer, his cultivation of carrots will hereafter be every year co-extensive with his flax ground.

9th. The great extent of his rich outside pasturage and the great abundance o his winter provender, enable him to maintain, besides other live stock, a vast number of mares, colts, cows and calves, which of course require untiring assiduity at all seasons and especially in winter.

10th. Such is the attention of this farm to domestic manufactures that no part of the bedding or of the clothing of the people, except their shoes and hats, is purchased.

11th. The ice house, built by the negroes themselves, is every year so carefully filled as to keep the ice in a state of high preservation throughout and even more will be required; and in situations the whole scason.

12th. The apricot and plum trees are along the fence on one side of the lane leading to the dwelling. They are protected by a parallel temporary fence, made so as to admit the hogs and to exclude the cattle. And as the apricots and plums of these trees do not fall but ripen every year unless destroyed by an early frost, their preservation is attributed to the good offices of the hogs.

13th. The peach and pear trees are preserv ed by a very simple process. As soon as the, leaves of a tree begin to curl or to change their color the dirt is removed from the roots to the distance of about 12 or 18 inches from the stem of the tree. The roots are carefully scraped and every part wounded by the insects, or at all discolored is cut out and the incision made smooth by a sharp knife. All the roots are then plastered with a thick coat of fresh cow dung, upon this coat of dung are put fresh hickory ashes enough to fill the hole. The dirt dug out is thrown aside, so that the surface around the tree is altogether of ashes.

This enumeration of particulars has been here set forth for the purpose of shewing the multifaold filly, from a favorite son of the New York thought, which for a series of years, have been case, it should have two or more. - Mech. Adv

Eclipse, and the other two are foals of this spring advantageously committed to the care of pegroes. which, for some time, has been gradually improving, as is indicated by its general appearance and by

LIGHTNING RODS.

The following are the most approved rules for the construction of the Lightning Rod, and for its proper adaption to buildings; and we recommend them to those who are concerned in the erection of Houses, Shins, and Manufactories.

1st. The Rod should consist of Iron, about three quarters of an inch in diameter; closely joined throughout, either by securing one part within the other, or by welding the several parts together; it being found, that links or loose joints prove a great interruption to the passage of the electric fluid.

2d. The upper end of the rod should terminate in three prongs, or branches, of a pyramidial form, with the edges, as well as the point, very sharp; this part also should be gilded, because its conducting power will be impaired by oxidation or rust.

3d. It should be elevated five or six feet above the highest part of the building, giving preference to the kitchen chimney, if it be equally high with the others; as it is more of a conductor, by reason of the vapor and smoke, which are constantly ascending through it.

4th. The rod should be secured to the building by wooden cramps, instead of iron ones, as is frequently done; for, although electricity will take the shortest route, through a good conductor, vet in case the rod should become slightly imperfect from any cause, the passage of the fluid into the building would be favored by iron balts.

5th. The lower end of the rod should descend into the earth in a direction leading from the fourdations; and deep enough to be connected with earth which is continually moist. In some places four feet will be sufficient, in others five or six. which are very dry and rocky; it will be best to connect the bottom of the rod by means of a chain, or the rod continued, with a well or vein of water. If this cannot be done, a trench should be dug at some distance, and filled with charcoal in which the rod should terminate; as charcoal, from its power of absorbing and retaining moisture, is always a good conductor of electricity: It would be well also to have this end of the rod pointed, and branch off in several directions, to facilitate the passage of the fluid.

6th. Paint made of lamb-black, is best suited to Lightning Rods, to protect them from rust; this substance being a better conductor than other kinds of paints.

7th. Manufactories, and other large buildings should be furnished with more than one conductor; for it is a mistake that a single rod will protect all in its neighborhood or even a very large building: Its protecting power is said to extend to only about forty, or fortyfive feet in each direction.

Sth. For ships, a large copper wire, secured to the mast as above directed, and made to extend a foot or two above it, and to pass over the deck in a groove made for the purpose and to terminate in the water, will be an ample protection unless the ship should be a large one; in which

From the Generee Farmer.

THE CURCULIO.

Frost so frequently occurred in the 5th month, 1830, that the operations of the Curculio were nearly suspended, even on trees which were not protected, and which in other years had lost the whole crop of feuit.-Although on the commencement of warmer weather, some of these insects appeared, yet I believed that few of the larva had escaped the vigilance of the goese and pigs; and felt a confidence that we had fittle to apprehend from their depredations this season. It appears however, that the number of guards which I had appointed was too small for the size of my fruit garden. We have lately discovered that much of the fruit has been punctured by the Curculia, and we have found it necessary to resort to the method which I proposed in the N. York Farmer, Vol. 3, No. 3. By spreading sheets and jarring the trees, we have destroyed more than 300 of these insects within the last 24 hours, and have only to regret that this work has been so long delayed.

I now find that the trees in my fruit garden might have been much better arranged. Had the apricots, plums, and nectarines been planted on one side, a temporary fence would have confined the geese and pigs amongst those trees, and their services would have been rendered much more effectual.

It has been said by the late Dr Tilton, (to whom we have been indebted for much information on this subject) that the Cureulio seldom uses its wings, and that it climbs up the tree. Probably this may be its usual practice, but we have seen t fly from one tree to another, and we have observed in a great many eases, that in falling on he sheets the wings were at least partially expanded. One observer has even seen it fly from he sheet into the tree.

Before closing this note, I wish to express my ntire confidence in the method which we now employ for destroying this insect; and again recommend it to those whose fruit trees stand in nclosures from which geese and pigs must necesarily be excluded. Diligent attention to this busiless night and morning, for a short period. hough it may not destroy the whole colony, will ecure a sufficiency of fruit; and we ought to renember that the labors of next year may be greaty lessened by gathering and destroying in the bresent season, the damaged fruit as it falls.

6th mo. 2.

How can Grapes be best and longest preserved fler they are cut ?-I have many vines under my are, and am expected to supply grapes at table as ong as possible: I consequently allow them to ang longer on the vines than is right they should, anxious to learn the very best mode of keeping rapes after they are cut, I communicate my preent mode, that its defects may be perceived and mended by some kind correspondent knowing better. I save the Syrian till last; the Hamurgh and other kinds were last year ripe at the nd of July, and were not all cut till December 2. The Syrian, which I never cut till perfectly ripe. cut about the 10th of December. I then procurd some clean sand, and dried it by the fire, till it yould pass through a fine hair sieve. The granes nd the sand being dry, and the sand become cold. took a shallow box, and having separated the

placed them in the bottom of the box; pouring the sand well in among the berries, so as to prevent as much as possible any two berries from touching each other. I then placed the box in a warm dry room; and by these means I have kept the grapes this senson for above two months from the time I cut them, as I only finished the last of them yesterday; and they were acknowledged, by those who partook of them, to be as good as when but into the sand, except that the stalks had turned brown, Yours, &c .- E. S .-Gardener's Magazine.

Why do Peas boil hard? - Sir, Your correspondent J. M. wishes to know the cause why neas boil hard. I suppose he means when dry for soup. The cause is I believe their being too old. I mean more than one year old. After that age they do not break well, not even the best boilers; I have seen Knight's crumbled marrow and the blue Prussian, at three years old, boiled for twelve hours in soft water and in an iron pot (which one would suppose is iron enough, if that metal would affect them,) and they would not break nor bruise kindly when beaten in a marble morter with a wooden pestle. From this I consider the cause of hard boiling peas to be age, even if they are split-so far probatum est .- Eng. Gar. Mag.

Uses and Benefit of the Acarus, or, as it is commonly called, the Red Spider .- Sir, I have frequently observed in the spring and summer, beautiful insects of a rich crimson velvet appearance, both the students of the Virginia University. in the open air and under glass; and have beard them stigmatised by amateurs, and once by a practical gardener, as 'red spiders, the gardener's greatest enemy, &c.' I have also had the mortification of witnessing their destruction before I could utter a word in their behalf. Now, I. Sir, know not whether this insect belongs to the genus Acarus or not : but this I do know, that some of its habits richly entitle it to the appellation of the gardener's friend. In the spring of 1828, I observed the under-side of the leaf of a plant of Nerium splendens bad a row of Coccus hesperidum attached along one side of the midrib; and, about half way along this row, I observed one of the crimson insects. above described, apparently feeding upon one of the Coccior scales (which, by means of a botanical glass, I convinced myself was actually the case): indeed, the insect in its rear were become truly scales, the spider having reduced them to mere dry films; and those in front progressively shared the same fate, I took particular pains to aseertain the fact. Since then I have frequently found the Acari not only assisting the gardener in the destruction of the scales, but of the green Aphis

Indeed, on one occasion, I kept a quantity of the spiders under a bell-glass, with no other food than the Aphiaes, for several days, upon which they appeared to thrive amazingly; and I afterwards distributed them amongst plants infested by the Aphis, when they recommenced their work of destruction. I therefore venture to plead for insects, the appearance of which gives additional beauty to our plants, and the utility of which I would fain make more generally known. I am Sir, yours, &c .- William Godsall. Hereford. London.

SPIRIT OF IMPROVEMENT .- Perhaps at no age of the world has the spirit of improvement so general-forty years, still perfectly sound.—How is it that no ly pervaded mankind, as from 1812 up to the pre-such ships are built now-a-days? It is the dry-rot, houlders from the main stalks of the bunches, I sent time. Man is constantly engaged in new inven- or underwriting that flourishes.

tions-his mind not only soars to, and embraces, the most sublime topics, and the most useful contrivances which man has ever designed, but it takes within its scope, objects which would seem of the most trilling importance, and of the least possible benefit to the community. The spirit of improvement is by no means confined to patent rights. Behold it marching westward, like a strong host-you see a few hardy individuals enter the border of a deep and tangled forest, eagerly bent upon some object, which it is not easy, perhaps, for you to divine : follow these ever-stirring spirits and you soon see in their rear, villages, towns, and even cities arise, as if by the magic wand of enchantment

It is only a few years since Rochester, in the State of New York, was a desert-a place where the owl held her reign unmolested, and the fox and wild cat sported in their native forests secure, and were seldom started from their gambols by the noisy sounds of busy industry in their borders -now a City-a place where thousands have gathered and call it their home-where luxuries from the remotest seas and lands are unladen, and where all nations and all tongues are engaged in the business of life, each seeking his own individual comfort and advancement-how unlike the seene.

'When wild in woods the noble savage ran.'

N. H. Spectator.

The following is from a periodical published by

DEATH OF ADAMS AND JEFFERSON.

When it was announced that the death of Thomas Jefferson had occurred on the fourth of July, 1826, at the time when the whole American people were engaged in celebrating the jubilce of their independence, in the consumpation of which he had acted so distinguished a part, we were struck with wonder at the extraordinary coincidence. But when the intelligence soon afterwards arrived, that his illustrious colleague, John Adams, had died on the same day, our astonishment knew no hounds. Every one considered the concurrence of these two events, each in itself so improbable, as a prodigy most miraculous, and nothing but an amount of evidence absolutely irresistable could have convinced us of its truth

But while every one can thus feel that this event was in the highest degree improbable, we have not seen any attempt made to estimate in numbers, the amount of this improbability. Yet the problem is as capable of solution as any other in the doctrine of

[Here follows an arithmetical calculation, the result of which is as follows.]-En.

Hence it appears that the odds were more than 1721 millions to one against the occurrence of both these events; or that a bet against it, to correspond with the chances, should have been more than seventeen millions of dollars to a cent. Yet it did actually happen; and we see how much reason there was for the universal astonishment which it excited.

Age of Ships .- The Royal William was launched in 1719, and is supposed not to have been repaired till 1757; it was surveyed affoat in 1785, and probably lasted many years more. The Betsey Cains vacht, in which King William performed his first vovage to England, was then several years old; it was sold to a merchant in the reign of George I. and employed in the coal trade, in which services she existed till February, 1827, when she struck on a reef of rocks near Tynemouth Bar, and was there lost, only for want of timely assistance, her timbers being, after the lapse of at least one hundred and

NEW ENGLAND BARRER.

BOSTON, WEDNESDAY EVENING, JULY 43, 1831.

CLOSE OF THE NINTH VOLUME OF THE NEW ENG-

LAND FARMER. It would be ungrateful in us not to avail ourselves of the opportunity, which the present stage of our labors presents, to acknowledge with gratitude past favors from patrons and correspondents, and solicit their continuance. Our paper from its commencement to its present advanced stage has increased by regular, and nearly uniform additions, as well to its correspondents as its subscribers; and we are now favored, as regards both those indispersables, beyond the extent of our anticipations when we commenced our publication. No exertions on our part shall be wanting to make The New England Farmer and Horticultural Journal, in some degree worthy of the extensive and increasing patronage with which it has been honored. And as one step towards the consummation of our wishes, in this particular, we hope to be able to publish accounts of the best farms, the improvements made in their cultivation &c, in this vicinity, that our agricultural friends may derive advantages from the experience of others, in the same honorable vocation.

We would beg leave to intimate that those gentlemen who may happen to be somewhat in arrears relative to payments for the paper would oblige us by transmitting the sums due; and that somewhat may be saved by anticipated payments of the next volume.

FARMER'S WORK FOR JULY.

The following valuable observations on harvesting

grain, are from Lorain's Husbandry. Custom has induced farmers generally to believe, that it is an improper and wasteful practice to cut either wheat or rye with the scythe and cradle. If the grain be neither lodged nor entangled, it may be cut off as clean by the scythe and cradle, as by the sickle. If it be properly gathered and bound, but little, if any, more loss will arise from gathering it in this way. If the grain be cradled in proper time, it shatters less, on the whole, than when it is reaped and secured in the usual way, their health by drinking ardent spirits to the It is readily granted that if grain be cradled and amount of it. It is not, however, in my practice reaped at the same time, it shatters more by the former practice. It should be recollected, how- workmen either in harvest, or at any other time, ever, that the very tardy progress of the sickle greatly increases the shattering, by prograstinating the harvest so long that the chaff opens, and much their grain to rot on the ground, than sanction of the grain falls out. Whereas the rapid progress this enormity. of the scythe and cradle cuts off the grain, before any material loss from shattering can take place, if the cultivator commences in time. No evil, but their fields are cleaner reaped, and with much less much good, will arise from beginning early. This trouble and expense. Why then, is not this disnot only prevents shattering, but also the risk of graceful practice, of injuring the morals, health, encountering the various injuries to which the crop reputation, and circumstances of neighbors abanis exposed by useless delay. Some farmers of the doned? especially, as in doing this, we also infirst respectability assert, that practice and obser- jure ourselves. vation have convinced them, that the grain, and also the flour, are best when wheat is cut much before the usual time. This, however, does not accord with my practice. The middle course, between the extremes of cutting very early, or at the usual time, will be found the best; except when mildew occurs. In that case, wheat should be cut immediately after it can be determined that grain be fit to cut.

Many judicious, and well attested experiments determine, that when wheat is badly injured by mildew, the grain gets no better, if it be suffered bappy to recommend to others, a new article for to stand. That if it he cut off immediately after cleaning and preserving the teeth, and cleansing the injury is seen, the grain actually derives very the mouth, which appears to us to be much supeconsiderable advantage from the sap contained in rior to any other dentifrice, which has ever atthe straw.

Bad cradlers, and bad reapers, destroy much grain: infinitely more, however, is lost by those considered, as the holidays too generally are, a time for drinking to excess. This renders many incapable of doing anything properly. Others, any disagreeable caint or odour. who are not quite so far gone, are disposed to run races a part of the day, and spend the rest of it in drinking under the shade, or in quarrelling and recommended by Dr Webster, Erving Professor fighting.

community are, at this season of the year, more tuck, Dr S. A. Shurtleff, of Boston, and a numlike drunken savages than members of a civilized ber of other medical and scientific gentlemen, who community. This evil does not spring either from have witnessed or experienced its efficacy; not Avarice seems to have been the first moving cause their neighbors by a more plentiful supply of ardent spirits.

If those farmers had known their own interest, or wished to promote the interest, and rational cine chest, intended for domestic use or for exhappiness of those employed by them, or to act as men professing Christianity should, or, indeed, as an infidel would act, if he were not blinded by a false estimate of self interest, this shocking practice would not have been introduced.

Every farmer who wishes to promote the interest of agriculture, should set his face against it, and in lieu of whiskey, &c, pay an equivalent in money. I have never found it difficult to procure, either in the back-woods, or elsewhere, as full a supply of workmen as my neighbors, who gave them as much ardent spirit as they would drink, although they got none of this from me. After the harvest was over, it was clearly seen, that the workmen were far better satisfied with receiving an equivalent in money, in place of injuring only, that the beneficial effects of not allowing intoxicating liquors appear. There are many farmers in Pennsylvania, who would sooner suffer

Now, it is very observable, that these men never suffer by this arrangement; on the contrary,

Caltle Show and Fair .- The Trustees of the Winthrop Agricultural Society, have given notice that they shall hold a Cattle Show and Fair at Winthrop, (Me.) in September next; and have offered liberal premiums on Stock, Domestic Manufactures, and Grain and Vegetable crops, viz. Indian Corn, Spring Wheat, Barley, Potatoes, Ruthe disease is severe. If the crop is only slightly to Baga, Mangel Wurtzel, and Carrots : applicants affected, it is far better to let it stand until the for premiums to give the particulars of their modes of cultivation.

TOOTH WASH.

We have used with benefit to ourselves, and are tracted our notice. There seems to be some substance or substances held in solution by the liquid. which combine with and destroy or render harmwho could perform either well, if harvest was not less any unwholesome or offensive matter which may adhere to the teeth or gums, or prevent the mouth and breath from being perfectly free from

The composition to which we allude is called. Compound Chlorine Tooth Wash. Shatbenevolence or hospitality in their employers, only as a lotion for the teeth, but a valuable application in cases of fever, canker, diseases occasionof this enormity. In direct opposition to the laws ed by mercury, &c, &c. We have every reaof God, and the reason of man, this contempti- son to suppose, not only from our limited experible, selfish principle, induced many to outbid euce, but from the testimony of the most scientific and best qualified judges, that this dentifrice is a very valuable article, and one which ought to compose a part of the contents of every mediportation. We think it preferable to any powder, on several accounts; among others it may be more easily applied to extensive surfaces, to the interior parts of carious teeth, miected with a syringe, in cases of ulceration, or imbibed by the pores and capillary tubes of the skin, &c : and that it possesses other advantages which a little use will develope without our recapitulation.

The above mentioned article may be obtained of Messrs Lowe & Reed, Druggists, No. 111, State Street, and of most other druggists in Bos-

As this article has been counterfeited the public should be apprised that none is genuine except that which has the written signature of the above named Lowe & Reed.

We notice in the Lansinburg N. Y. papers that the Reusselaer Horticultural Society recently held their fourth meeting and exhibition at that place. A lecture was delivered by Professor Eaton, and a display of early fruits, flowers, and vegetables made, that would do honor to any part of the country. Mr Alexander Walsh of Lansinburg, brought forward eleven varieties of cherries, two of strawberries, two of gooseberries, many fine vegetables, rare plants, and specimens of last season's reeled silk and cocoons. We believe it is owing mainly to the activity and public spirit of this gentleman, that the society has been organized, which has given a new impulse to the culture of garden crops and fruits in that quarter.

We are happy to state that Doct. Malthus A. WARD, of Salem, has accepted the invitation to deliver the Annual Address before the Massachusetts Horticultural Society at their ensuing anniversary in September.

Boston and Worcester Railroad .- About nine hundred thousand dollars were subscribed to this stock, in this city, by yesterday.

To Correspondents. - Several communications received.

Wood-Has fullen and is falling. The Manufactorers have nearly their stock for the year. The farmers have been killing their calves and raising their lambs; so that next year the quantity of wool in the market will be greater and the price less; and so on, till the farmers call raising wool a losing business, and give their sheep to the hogs. Then wool will become scarce and the price will rise, and more sheep will be raised and the price will come down again, and so on indefinitely. It will however be a good business on the while for those who follow it steadily and indiciously; as all that it brings at the shearing floor, over twentyfive cents per pound, where sheep are well managed, is clear profit. Keep about as many sheep as your farm will most conveniently maintain, and you will have a steady, though unequal profit. Go to speculating-disarrange your other business for the sake of keeping a great many sheep, just because wood now brings a good price, and you will probably bring your great crop of wool to market just in season to catch a loss .- Vermont Chronicle.

Dr Drown.—This enthusiastic and scientific professor, has just commenced a course of Botanical Lectures in this town, which are fashionably attended. The terms of admission are inconsiderable compared with the value of the lectures. We have never heard a more charming lecturer than Dr Drown. His faculty of illustrating every subject that comes under his view, is excellent. He is never tedious or unnecessarily prolix, but always clear and energetic. His lectures are worth the attention of all who may wish, in so easy a manner, and at so small an expense, to obtain a knowledge of the science of Botany.—Providence Journal.

It is stated in the Aurora that 600, boxes of strawberries have been gathered from one beloof a quarter of an acre in West Cambridge, and that the yield from it this season will be 1400. 100 bushels of apples where gathered from five trees in the same town last year: two yielded 25 bbls. ecch.

Mr Stimpson's Horse Car.—The experiment made on Saturday, with the car moved by horses travelling in it on a moving floor, was entirely satisfactory as to the mode of applying Horse power, as to cause a great increase of velocity without increasing exertion to the horses.

The ingenious inventor has so constructed his car, that the horses moving it, by walking at the rate of two and a half miles per hour, propel the car at the rate of fifteen miles per hour, evidently with as little fatigue as horses experienced in ploughing or travelling with a wagon conveying a moderate load. The rate of speed appears to us the medium, which may be used without injury to the horses. It may be increased on a level. or descending rail-way free from short curves -and should be reduced in ascending or very crooked roads. If the use of horse power should he continued on our Rail-Roads such a mode of applying it would be important, indeed indispensable for travelling at a greater medium speed than ten miles an hour .- Balt, Gaz.

Temperance!—Here is an example worthy of imitation. The town of LEE, the second largest manufacturing town in the county of Berkshire, Mass. has not in it a store, shop, dwelling, hovelor cellar, in which ardent spirit of any kind is either bought or sold.—Albany.Adv.

Cure for oven strained by over drawing.—About half a pint of common soap, stirred up with a quart of milk, poured down the throat of the munual wilk, we are told, speculity effect a cure.

Bees

The Subscriber has 300 swarms of Bees for sale, in his Patent Slide Beehives, at 20 cents per pound, weight of each swarm from 40 to 100 lbs. tare of hive deducted; the price of the Patent hives is \$2 a piece, and the price of a single right \$5.

Also for sate, 200 swarms of bees in the old tashioned hive, price 17 cents per pound, tare of hive deducted.

The above will be delivered within fitty miles of Boston, in good order, (warranted free from moths or otherwise damaged) by the first day of March, 1832.

All letters must be sent in before the first day of September, 1831, post paid, to the subscriber, at Brighton, Mass, so as to have time to transport them from Maine, N. B. The weight of the above hives will be taken in September.

[BENEZER BEARD.]

Medical School in Boston.

The Medical Lectures of Harvard University delivered in Boston will be commenced in the Autumn, at the usual period, viz. on the third Wednesday in October. They will be continued lour in 1ths.

This extension in the term of the Lectures has been thought necessary to afford time for such a course of instruction and demonstration, as is deemed by the Faculty to be requisite, under the advantages which have recently accrued to the School.

The Legislature of Massachusetts, with an enlightened liberality, which close honor to our age and country, have extended the protection of law to the cultivation of Anatomy within tais Commonwealth. The advantages which will hence result to students resorting to this school will be sufficiently obvious. It will be the aim of the Professors to earry into effect the intentions of the Legislature, in such a manner as to evince at the same time their respect for the rights of humanity, and their interest in the promotion of the healing art.

The opportunities for practical instruction at the Massachusetts General Hospital continue undiminished.

The course of Lectures will be-

On Anatomy and Surgery, by Dr Warren. " Chemistry, by Dr Webster.

" Materia Medica, by Dr Bigelow.

" Obstetrics and Medical Jurisprudence, by Dr Channing.

"Theory and Practice of Physic and on Clinical Medicine, by Dr Jackson.

WALTER CHANNING,
Dean of the Faculty of Medicine.
Boston, June 15, 1831. 6t* july16

Turnip Seed.

For sale at the Seed Store connected with the New England Farmer, No. 52 North Alarket Street, Boston, 200 lbs White Flat Turnip Seed, the growth of the present season, raised in this vicinity expressly for this Establishment.

Also-Ruta Baga of the very first quality, of both American and European growth; Yellow Aberdeen, Yellow Stone, White Norfolk Field, and Yellow French Turnips; Long Pickly and other Cucumbers, for pickling, warranted genuinc and fresh.

Cows and Catves.—Sales were effected at 18, 29, 24 and \$30.

MISCELLA VY.

The following was snog at the table to Charlestown, Mass. by Mr J. W. NEWELL, in celebrating the late anniversary of the 4th of July.

JONATHAN AND JOHN BULL.

A FESTIVE SONG. BY T. G. FESSINDEN.

By Bigots coerced and by Tyrants oppressed, Fair Liberty fled from the minions of Power. And found an asylum in wilds of the West:-The glade was her mansion-house, forest her bower.

But John Bull, (in mischief not apt to demur, A churlish curmudgeon as bread ever broke,) Declared that he meant to annihilate her. And make her hold offspring pass under his voke,

But Freedom's son Jonathan, subtle and stout, Said Bull was the most brutal bear ever cubb'd, 'Then quicker than lightning gec off and back out, Or 1 rather guess you'll get decently drubb'd.

'Taxation no Tyranny,' that's true enough, As Doctor Pomposity says, ne'ertheless, To tax without representation is stuff, We sons of Columbia sha'nt swallow, 1 guess.

'I've been for three months to a nice winter-school. Have heard of Man's Rights, and I know what is wrong.

With leave of your bull ship, I'm not such a fool. That my birth-right I'll swap for a sop or a song.

' By my larnin I've found out a thing and a half. Of consequence know that 'all men are born free;' And if I'm old Bos' legitimate calf. Like a stag in the stancheons you can't tether me.'

Bully Bull but re-butted rough words with tough horns, Bide cannon re-billow the logic of power; Thus might treads on right-thus strength ever scorns Strong reasons, though plenty as drops in a shower,

Joen couldn't stand that, and so-at it they went, And fought like two catamounts seven long years; By the least computation the combatants spent An ocean of blood, and a deluge of tears.

Independence we won, and establish'd at last, This brightest and best of our Festival days: And the tru of July should never be past, Unhonor'd by Glory's most splendid displays.

But the Memary of Heroes, who bled on you height, Should chasten and hallow testivity's mirth, And bid the philanthropist Imil with a dight The era when war shall be banished from c. th.

The epoch's approaching, we hope it's not far. When nations shall shadder at national crimes, And Witcheraft and War-craft be placed on a par, In annals of bye-gone and barbarous times,

May Liberty's lambent innocuou: Hoze, Lately lighted in Europe, the wide world illume. But may its most vivid and ardent displays, Like the flame in the bush, BURN-hat never con-

From the Massachusetts Journal and Trabune.

A DISCRIMINATING MONKEY.

An industrious German in the neighborhood of Philadelphia, before the revolution, had laid up a tiring to Hanover. At one time, his inclination to considerable sum of money in guineas, (at that time the common and favorite currency in the colonies, to the Lord Chancellor Thurlow, who honestly told as well as in the mother country.)

morning, for eventyfive years. Hearing of the death of a near relative in Germany, of whose property he was the heir, he determined to quit his milk cart, take ship, and revisit the land of his fathers. Accordingly having put on board his most valuable effects, deposited in a pine chest, and having also embarked an American bison, for the purpose, as he expressed it, of 'making de show mithis Buffalo' - Like. The soil is principally a sandy foam, much of it he set sail. 'Dere vas,' said he, 'em mun in ter covered with such black month. The timber is chiefly sheep, I dono vat de teivel nation he vas; they call him Mangy-I spose dat mean leetil mun." To this animal, which was a monkey, the German from the beginning showed the most decided aversion .-He could not endure his mischiefs and grimaces, and the monkey seemed to have a sense of revenge in doing all sorts of ill turns, and practising his most contemptible mimicries upon the German. One day when the latter had opened his chest, and takon out a bag, of which he was busy in fingering and counting over the contents, a sudden and strange noise on deck so alarmed him, that he ran up to see what was the matter, dropping his bag into the open ble trouble, and to the greatest advantage, the drovers chest. After ascertaining that there was no cause purchasing at the very doors of the farmers, and paying of alarm, he was descending to the cabin, when he saw Mungy ascending the rigging, grasping his own bag of guineas! The German roared for help, and the sailors went aloft to rescue the bag, but Jacko skipped from rope to rope, and perching safely on the extremity of a yard, he began to overhaul the contents of the bag, while the poor German watched his motions with a breathless anxiety. 'Mungy put his hand in de bag, and take mine guinea; he put him to his nose, den chatter, chatter, chatter, and drop him in de vatter! take another, chatter, chatter, chatter, and drop him in de bag; take another, and chatter, chatter, chatter, and drop him in de vat'er; I wonder how de teivel de tam mungy know dat I put vatter in de milk; for vat belonged to de vatter, he give it to de vatter, and what belongit to de milk he put it in der bag.'

After the monkey had amused himself sufficiently at the German's expense, and separated the milk from the water, being left to himself, he quietly descended and replaced the bag in the chest.

A Hogsty Disgraced .- The following anecdote is extracted from an address delivered before the Temperance Society in Bristol, Conn:- 'A certain person, whose relative gave me the information, returning home one evening intoxicated, mistook his hogsty for his dwelling house; and on attempting to enter it, a little error in calculating the comparative height of the door sill and his toes, caused him to make a speedy fall at full length within. Instantly relieved from the burden of carrying his head highest, he gave himself up to the full enjoyment of drunken inaction. Startled at his abrupt intrusion, the inmates of the sty had made a precipitate retreat to the remotest part of it; but seeing no further movement, then began to reconnoitre the animal which had surprised them by conduct so much more grovelling than their own; and, by degrees, venturing to approach him, they came up around him at length, and commenced a e oser examination by gently rooting him up alternately on each sule, This hoisting by the swine, at length became so violent as rather to disturb him; at which time the comfortable condition in which he imagined himself may be conceived from the exclamation that he sluggishly uttered- Do leave off tucking up, and come

Croly in his life of George the Fourth, states that George the Third, in the height of his popularity, became so sensitive to the attacks made upon him by the opposition, in consequence of the appointment of Lord Bute as prime minister, that he is said to have conceived the idea of abandoning England, and retake this stop was so great, that he communicated it His gains were him, that though it might be easy to go to Hanover, chiefly obtained by carrying milk to market every it might be difficult to return to England.

Valuable and Cheap Land-for Sale.

The subscriber offers for sale, 11,000 acres of choice Land, situated in the town of Pinckney, county of Lewis and state of New York. Some of the land is improved and under cultivation. The country is remarkably healthy, being entirely free from the fever and ague and from the common bilions lavers which often afflict the towns upon Lake Octain, this town being 18 miles east of the Sugar Maple, Black Ash, Butternut, Beech, Elm, &c. The land yields first rate crops of Grass, Rye, Oats, Barley, Potatoes and Flax; and on some lots, good Wheat and Corn may be grown. To those wishing to obtain superior grazing farms, a fine opportunity now offers itself. The produce of pasturage and hay from an acre of this lind, is very large, fully equalling if not surpassing that from the same quantity of land in any other of the Black River townships - The land is admirably well watered, there being out few lots which have not durable running streams upon them. The land is well adapted to Orcharding-the Apple tree thriving very well in this county. Stock of all kinds may be disposed of with the least possithe highest cash prices for their cattle, which will readily find purchasers at all seasons of the year. Several farmers at present residing on this town, were originally from the New England States, and some of them from Massachusetts, who are in thriving circumstances. The above described land is offered for sale at the very low price of from two dollars and a half to three dollars per ere, for the uncleared land, and from three dollars and a half to five dollars and a half for the improved lots. The land will be sold in lots to suit purchasers, and from two to five years' credit for payment in annual instalments, will be given. As a further convenience to purchasers, the subscriber will receive in payment, Cattle, Sheep, Perk. Grain or Grass Seed, for which products he will allow the highest cash prices. The title to the land is indisputable, and good Warranty Deeds will be given to purchasets. Person desirous of purchasing will please to apply to the subscriber, at Henderson Harbor, county of Jefferson, State of New York, or to DAVID CANFIELD, JAMES II. HENDERSON. Esq. on the town. ep16t March 9.

Ammunition 3 Of the best quality and towest prices, for sporting-constantly for sale at COPELAND'S POWDER STORE, 6 Broad Street.

N. B. If the quality is not found satisfactory, it ma be returned, and the money will be refunded. If Jan. y Hickory.

This astonishing fleet horse was raised in Montreal, is from an English blood mare, (sire unknown,) is not interior to any in the U. States for speed, action and beauty. He is a fine sorrel, well built, good size, and pronounced by (good) judges in every respect a first rate horse; trots a 3 minute gait, fast walker, and has paced around the trotting course, Long Island, in 2 minutes, 34 seconds, and was offered publicly to match against any horse that could be produced. It is considered unnecessary to say more, as his qualifications are teo well known to be doubted.

He will stand at Abbott's Inu, Holden, during the May 11. season. Terms \$8, the season. Gt

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year-but those who pay within sixty days from the mac of subscribing, are entitled to a deduction of fifty cents.

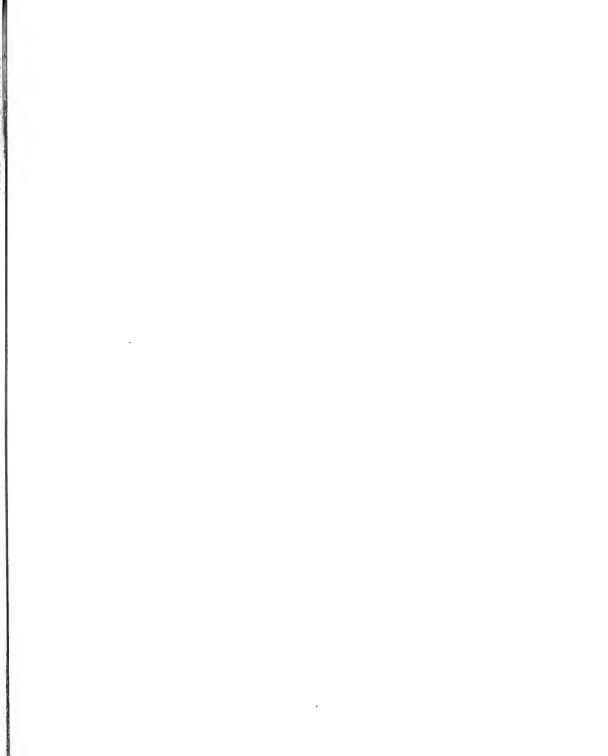

IF No piper will be sent to a distance without payment being made in advance.
